**ASYMPTOTIC EXPRESSIONS FOR  $\sum n^a f(n) \log^r n$**

ROBERT GEROGE BUSCHMAN

# ASYMPTOTIC EXPRESSIONS FOR $\sum n^a f(n) \log^r n$

R. G. BUSCHMAN

In this paper some asymptotic expressions for sums of the type

$$\sum n^a f(n) \log^r n,$$

where  $f(n)$  is a number theoretic function, are presented. (The summations extend over  $1 \leq n \leq x$  unless otherwise noted.) The method applied is to obtain the Laplace transformation,

$$\mathcal{L}\{F(t)\} = \int_0^\infty e^{-st} F(t) dt = f(s)$$

of the sum and then use a Tauberian theorem either from Doetsch [2] or its modification for a pole at points other than the origin, or from Delange [1] to obtain the asymptotic relation. If  $f(n)$  is non-negative, then  $F(t)$  is a non-negative, non-decreasing function and hence satisfies the conditions for the Tauberian theorems. In many cases the closed form of a Dirichlet series involving the functions are known, and in this case the relation

$$\mathcal{L}\left\{\sum_{1 \leq n \leq e^t} n^a f(n) \log^r n\right\} = (-1)^r s^{-1} (d/ds)^r \sum_1^\infty n^{a-s} f(n)$$

can be used. The functions chosen for discussion and the Dirichlet series involving them can be found in Hardy and Wright [3], Landau [4], [5], or Titchmarsh [7]. We present first a few illustrations of the method and then a more extensive collection of results is presented at the end in a table.

First we choose  $\sigma_k(n)$  as an example of a simpler type. Since

$$\sum_1^\infty n^{-s} \sigma_k(n) = \zeta(s) \zeta(s - k),$$

we have

$$\mathcal{L}\left\{\sum_{1 \leq n \leq e^t} n^{b-1-k} \sigma_k(n) \log^r n\right\} = f(s) = (-1)^r s^{-1} (d/ds)^r \{\zeta(s+1-b) \zeta(s+1-b+k)\}.$$

For  $k > 0$  the pole where  $\Re s$  is greatest is at  $s = b$  if  $b \geq 0$ . At that pole, since

$$\zeta^{(m)}(s+1-b) \sim (-1)^m m! (s-b)^{-m-1},$$

the Laplace transformation of the sum has the form

---

Received October 10, 1958.

$$f(s) \sim b^{-1}\zeta(1+k)r!(s-b)^{-r-1}.$$

Now if  $b > 0$ , then by modifying Doetsch [2, p. 517] for poles not at the origin or from Delange [1, p. 235] we obtain

$$\sum_{1 \leq n \leq e^t} n^{b-1-k} \sigma_k(n) \log^r n \sim b^{-1}\zeta(1+k)e^{bt}t^r,$$

or, if  $x = e^t$

$$\sum n^{b-1-k} \sigma_k(n) \log^r n \sim b^{-1}\zeta(1+k)x^b \log^r x.$$

If  $b = 0$ , then

$$f(s) \sim \zeta(1+k)r!s^{-r-2},$$

so that from Doetsch [2, p. 517] after substituting  $x = e^t$  we obtain

$$\sum n^{-1-k} \sigma_k(n) \log^r n \sim (r+1)^{-1}\zeta(1+k) \log^{r+1} x.$$

The expressions for  $\sigma(n)$  can be obtained by setting  $k = 1$ .

For  $k = 0$ ,  $\sigma_k(n)$  becomes  $d(n)$  which will be covered as a special case of  $d_k(n)$ .

For  $k < 0$  the pole where  $\Re s$  is greatest is at  $s = b - k$  so that for  $b > k$

$$f(s) \sim (b-k)^{-1}\zeta(1-k)r!(s-b+k)^{-r-1}.$$

Hence

$$\begin{aligned} \sum n^{b-1-k} \sigma_k(n) \log^r n &\sim (b-k)^{-1}\zeta(1-k)x^{b-k} \log^r x, & \text{for } b > k; \\ \sum n^{-1} \sigma_k(n) \log^r n &\sim (r+1)^{-1}\zeta(1-k) \log^{r+1} x, & \text{for } b = k. \end{aligned}$$

By analogy, since

$$\sum_1^\infty n^{-s} \phi(n) = \zeta(s-1)/\zeta(s),$$

then

$$\begin{aligned} \sum n^{b-2} \phi(n) \log^r n &\sim \{b\zeta(2)\}^{-1}x^b \log^r x, & \text{for } b > 0; \\ \sum n^{-2} \phi(n) \log^r n &\sim \{(r+1)\zeta(2)\}^{-1} \log^{r+1} x, & \text{for } b = 0. \end{aligned}$$

If  $\chi_k(n)$  represents a character, mod  $k$ , then the Dirichlet series can be represented by

$$\sum_1^\infty n^{-s} \chi_k(n) = L_k(s)$$

so that if  $\chi_k$  is a principal character then  $L_k(s)$  has a pole at  $s = 1$  and

$$\begin{aligned} \sum n^{b-1} \chi_k(n) \log^r n &\sim \phi(k)(kb)^{-1}x^b \log^r x, & \text{for } b > 0; \\ \sum n^{-1} \chi_k(n) \log^r n &\sim \phi(k)\{(r+1)b\}^{-1} \log^{r+1} x, & \text{for } b = 0. \end{aligned}$$

The Dirichlet series involving  $d_k(n)$  yields a power of the  $\zeta$ -function, i.e.

$$\sum_1^\infty n^{-s} d_k(n) = \zeta^k(s),$$

so that for  $k > 0$

$$\mathcal{L} \left\{ \sum_{1 \leq n \leq e^t} n^{b-1} d_k(n) \log^r n \right\} = (-1)^r s^{-1} (d/ds)^r \zeta^k(s+1-b).$$

Now the Laplace transform can be written to show the behavior at the pole at  $s = b$ ,

$$f(s) \sim (r+k-1)! \{b(k-1)!\}^{-1} (s-b)^{-r-k}.$$

Thus

$$\begin{aligned} \sum n^{b-1} d_k(n) \log^r n &\sim \{b(k-1)!\}^{-1} x^b \log^{r+k-1} x, & \text{for } b > 0; \\ \sum n^{-1} d_k(n) \log^r n &\sim \{(r+k)(k-1)!\}^{-1} \log^{r+k} x, & \text{for } b = 0. \end{aligned}$$

Special cases can be obtained for  $k = 1, 2$ , since  $d_1(n) = 1$  and  $d_2(n) = \sigma_0(n) = d(n)$ .

In an analogous manner we can obtain from

$$\sum_1^\infty n^{-s} d(n^2) = \zeta^3(s)/\zeta(2s)$$

the expressions

$$\begin{aligned} \sum n^{b-1} d(n^2) \log^r n &\sim \{2b\zeta(2)\}^{-1} x^b \log^{r+2} x, & \text{for } b > 0; \\ \sum n^{-1} d(n^2) \log^r n &\sim \{2(r+1)\zeta(2)\}^{-1} \log^{r+3} x, & \text{for } b = 0. \end{aligned}$$

Certain of the common number-theoretic functions have not been considered and do not appear in the table (in particular  $\mu(n)$ ,  $\lambda(n)$ , and  $\chi_k(n)$  for non-principal characters) because the sum  $F(t)$  fails to satisfy the non-decreasing hypothesis for the Tauberian theorems.  $\lambda(n)$  has the additional bad characteristic as shown by the poles of the closed form of the Dirichlet series

$$\sum_1^\infty n^{-s} \lambda(n) = \zeta(2s)/\zeta(s)$$

in that the pole of the numerator is on the line  $\Re s = 1/2$  which is critical for the denominator, and thus this is not the pole where  $\Re s$  is greatest as required by the theorem from Delange.

Results which he has obtained for the case  $r = 0$  and the functions  $\sigma(n)$ ,  $\sigma_k(n)$ ,  $d(n)$ , and  $\phi(n)$ , treated by a different method, have been communicated to me in advance of their publication by Mr. Swetharanyam [6].

Table  
Asymptotic expressions for  $\sum n^a f(n) \log^r n$

General term of the sum	Asymptotic Expressions	
	$b > 0$	$b = 0$
$n^{b-1-\frac{1}{k}} \sigma_k(n) \log^r n$ $(k > 0)$	$b^{-1} \zeta(1+k) x^b \log^r x$	$(r+1)^{-1} \zeta(1+k) \log^{r+1} x$
$n^{b-1} \sigma_k(n) \log^r n$ $(k < 0)$	$(b-k)^{-1} \zeta(1-k) x^{b-k} \log^r x$ $(b > k)$	$(r+1)^{-1} \zeta(1-k) \log^{r+1} x$ $(b = k)$
$n^{b-2} \sigma(n) \log^r n$	$b^{-1} \zeta(2) x^b \log^r x$	$(r+1)^{-1} \zeta(2) \log^{r+1} x$
$n^{b-1} d_k(n) \log^r n$	$\{b(k-1)\}^{-1} x^b \log^{r+k-1} x$	$\{(r+k)(k-1)\}^{-1} \log^{r+k} x$
$n^{b-1} d(n) \log^r n$	$b^{-1} x^b \log^{r+1} x$	$(r+2)^{-1} \log^{r+2} x$
$n^{b-1} \log^r n$	$b^{-1} x^b \log^r x$	$(r+1)^{-1} \log^{r+1} x$
$n^{b-1} \wedge(n) \log^r n$	$b^{-1} x^b \log^r x$	$(r+1)^{-1} \log^{r+1} x$
$n^{b-2} \phi(n) \log^r n$	$\{\zeta(2)\}^{-1} x^b \log^r x$	$\{(r+1)\zeta(2)\}^{-1} \log^{r+1} x$
$n^{b-1} q_k(n) \log^r n$	$\{\zeta(k)\}^{-1} x^b \log^r x$	$\{(r+1)\zeta(k)\}^{-1} \log^{r+1} x$
$n^{b-1}  \mu(n)  \log^r n$	$\{\zeta(2)\}^{-1} x^b \log^r x$	$\{(r+1)\zeta(2)\}^{-1} \log^{r+1} x$
$n^{b-1} 2\omega(n) \log^r n$	$\{\zeta(2)\}^{-1} x^b \log^{r+1} x$	$\{(r+2)\zeta(2)\}^{-1} \log^{r+2} x$
$n^{b-1} d(n^2) \log^r n$	$\{2\zeta(2)\}^{-1} x^b \log^{r+2} x$	$\{2(r+3)\zeta(2)\}^{-1} \log^{r+3} x$
$n^{b-1} d^2(n) \log^r n$	$\{6b\zeta(2)\}^{-1} x^b \log^{r+3} x$	$\{6(r+4)\zeta(2)\}^{-1} \log^{r+4} x$
$\frac{\sigma_a(n) \sigma_d(n) \log^r n}{n^{1+a+d-b}}$ $(a > 0) (d > 0)$	$\frac{\zeta(1+a+d)\zeta(1+a)\zeta(1+d)}{b\zeta(2+a+d)} x^b \log^r x$	$\frac{\zeta(1+a+d)\zeta(1+a)\zeta(1+d)}{(r+1)\zeta(2+a+d)} \log^{r+1} x$
$\frac{\sigma_n(n) d(n) \log^r n}{n^{1+a-b}}$ $(a > 0)$	$\frac{\zeta^2(1+a)}{b\zeta(2+a)} x^b \log^{r+1} x$	$\frac{\zeta^2(1+a)}{(r+2)\zeta(2+a)} \log^{r+2} x$
$n^{b-2} a(n) \log^r n$	$2(3b)^{-1} x^b \log^r x$	$2\{3(r+1)\}^{-1} \log^{r+1} x$
$n^{b-1} \chi_k(n) \log^r n$	$\phi(k)(kb)^{-1} x^b \log^r x$	$\phi(k)\{k(r+1)\}^{-1} \log^{r+1} x$
$n^{b-1} r(n) \log^r n$	$4b^{-1} L_4(1) x^b \log^r x$	$4(r+1)^{-1} L_4(1) \log^{r+1} x$
$n^{b-1} \wedge(n) \chi_k(n) \log^r n$	$b^{-1} x^b \log^r x$	$(r+1)^{-1} \log^{r+1} x$
$n^{b-2} \phi(n) \chi_k(n) \log^r n$	$\phi(k)\{kbL_k(2)\}^{-1} x^b \log^r x$	$\phi(k)\{(r+1)kL_k(2)\}^{-1} \log^{r+1} x$
$n^{b-1} 2\omega(n) \chi_k(n) \log^r n$	$4\phi(k)\{3kb\zeta(2)\}^{-1} x^b \log^{r+1} x$	$4\phi(k)\{3k(r+2)\zeta(2)\}^{-1} \log^{r+2} x$
$n^{b-1} \{\pi(n) - \pi(n-1)\} \log^r n$ $(r > 0)$	$b^{-1} x^b \log^{r-1} x$	$r^{-1} \log^r x$
