**A GENERAL SOLUTION OF TONELLI'S PROBLEM OF THE  
CALCULUS OF VARIATIONS**

LIONELLO A. LOMBARDI

# A GENERAL SOLUTION OF TONELLI'S PROBLEM OF THE CALCULUS OF VARIATIONS

LIONELLO A. LOMBARDI

**Summary.** The *alpha-asymptotical* property is defined for integrals depending upon any number  $m$  of surfaces of any dimension in nonparametric form. The existence of an absolute minimum of any alpha-asymptotical and lower semicontinuous integral in any *regular* class of *varieties* which is closed with respect to the *m-uniform* (Tchebyshev) metric is proved.

1. DEFINITIONS. Let  $D_i$  ( $i = 1, 2, \dots, m$ ) be a closed bounded set of the  $n$ -dimensional Euclidean space of the variable vector  $x_i \equiv x_i^j$  ( $j = 1, 2, \dots, n$ ), bounded by surfaces which are absolutely continuous in the sense of Tonelli [14, 16, 17], without multiple points, and let  $D$  be the cartesian product  $\prod_{i=1}^m D_i$ . Let  $y \equiv y_i$  ( $i = 1, 2, \dots, m$ ) denote a vertical  $m$ -vector, and let  $p$  denote an  $m \times n$  matrix, whose row-vectors are  $p_i \equiv p_i^j$  ( $j = 1, 2, \dots, n$ ). Let  $x$  be the  $m \times n$  matrix whose row-vectors are  $x_i$  and  $\phi[x, y, p]$  a real-valued function, defined for  $x_i \in D_i$  ( $i = 1, 2, \dots, m$ ) and for any  $y$  and  $p$ , which is continuous with all its derivatives of the types

$$\frac{\partial \phi[x, y, p]}{\partial p_r^s} \quad \text{and} \quad \frac{\partial^2 \phi[x, y, p]}{\partial p_i^s \partial p_r^t} \quad (r = 1, \dots, m; \quad s, t = 1 \dots n).$$

Let  $q \leq m$  be a positive integer and let  $U_q$  denote a set of  $q$  distinct positive integers out of the first  $m$ ; let  $\zeta$  be an index ranging over  $U_q$ , and let  $\mu(\zeta)$  be a mapping of  $U_q$  into the set of the first  $n$  integers. It will be assumed throughout, that for every  $q$ , every  $U_q$  and every  $\mu(\zeta)$ , all the partial derivatives

$$(1.1) \quad \frac{\partial^{2q} \phi[x, y, p]}{\prod_{\zeta=1}^q \partial x_{\zeta}^{\mu(\zeta)} \partial p_{\zeta}^{\mu(\zeta)}}$$

exist and are continuous for every  $x \in D$  and for every  $y$  and  $p$ .

Let  $T$  be a real positive number. Let  $y(x) \equiv y_i(x_i)$  ( $i = 1, 2, \dots, m$ ) denote a vector-valued function of the matrix  $x$ , such that each  $y_i(x_i)$  is a function with values in  $[-T, T]$ , which only depends upon the row

The author wishes also to express his thanks to Gerald W. Kimble for valuable help in preparing the manuscript.

vector  $x_i$ . We assume that each  $y_i(x_i)$  is absolutely continuous, in the sense of Tonelli [17]; we shall call *variety*  $V$  the set of  $m$  surfaces represented by  $y(x)$ , and the functions  $y_i(x_i)$  will be called *components* of  $y(x)$ .

Let

$$p_i^j(x) \equiv \frac{\partial y_i(x_i)}{\partial x_i^j} \quad (i = 1, 2, \dots, m; j = 1, 2, \dots, n)$$

and

$$dx \equiv \prod_{i=1}^m dx_i \equiv \prod_{i=1}^m \prod_{j=1}^n dx_i^j .$$

The  $m \times n$  integral

$$I_V \equiv \int_D \phi[x, y(x), p(x)] dx$$

is called a *variety integral in nonparametric form*; all the varieties  $V$  where  $I$  exists and is finite are called *ordinary*.

Let  $\bar{p} \equiv \bar{p}_i \equiv \bar{p}_i^j$  denote another variable in the space of the matrix  $p$ ,  $\bar{y} \equiv \bar{y}_i$  another variable in the space of the vector  $y$ ,  $\bar{V} \equiv \bar{y}(x) \equiv \bar{y}_i(x_i)$  another variety  $\bar{V}$ ; let

$$\bar{p}_i^j(x_i) = \frac{\partial \bar{y}_i(x_i)}{\partial x_i^j} .$$

The distance  $\rho(V, \bar{V})$  between  $V$  and  $\bar{V}$  is defined by the formula

$$\rho(V, \bar{V}) = \sup_{x_i} |y_i(x) - \bar{y}_i(x)| .$$

In the sequel (whenever not otherwise specified) all of the topological properties of spaces and families of varieties  $V$  will refer to this *m-uniform* (Tchebychev) metric.

Let us assume by convention that if  $\eta$  is a variable integer ranging over a set  $S$  and  $\{\alpha_\eta\}$  is a sequence of numbers, then

$$\prod_{\eta \in S} \alpha_\eta = 0 , \quad \text{whenever } S \text{ is empty} .$$

Let  $L[x, y, p, \bar{p}]$  denote a polynomial in the indeterminates

$$(1.2) \quad [\bar{p}_i^{(j)} - p_i^{(j)}]$$

of degree not exceeding 1 in any of the vectors  $[\bar{p}_i - p_i]$ , whose coefficients  $W_{U_q, \mu}(x, y, p)$  are functions of  $(x, y, p)$  which are continuous together with all their derivatives of the form

$$(1.3) \quad \frac{\partial^\alpha W_{U_q, \mu}(x, y, p)}{\prod_{\xi \in U_q} x_\xi^{\mu(\xi)}}$$

$L[x, y, p, \bar{p}]$  may be written in the form

$$(1.4) \quad \sum_{q=1} \sum_{\sigma_q} \sum_{\mu} W_{\sigma_q, \mu}(x, y, p) \prod_{\sigma_q} [\bar{p}_{\xi}^{\mu(\xi)} - p_{\xi}^{\mu(\xi)}].$$

The *generalized Weierstrass function* of  $I_{\nabla}$  with respect to  $L[x, y, p, \bar{p}]$  is defined by the formula

$$(1.5) \quad \mathcal{E}_L(x, y, p, \bar{p}) = \phi[x, y, \bar{p}] - L[x, y, p, \bar{p}].$$

The integral  $I_{\nabla} = \int \phi[x, y(x), p(x)] dx$  is said to be *positively quasi-regular with respect to L* (abbreviation: *LPQR*) if both the relations

$$(1.6) \quad \mathcal{E}_L[x, y, p, p] = 0$$

$$(1.7) \quad \mathcal{E}_L[x, y, p, \bar{p}] \geq 0$$

hold for every  $x \in D$  and for every  $y, p, \bar{p}$ .

We say that  $I_{\nabla}$  is *positively quasi-regular* (abbreviation: *PQR*) if there exists at least one function  $L[x, y, p, \bar{p}]$  such that  $I_{\nabla}$  is *LPQR*.

REMARK 1.1. If  $I_{\nabla}$  is *PQR*, then its value at every nonordinary variety is  $+\infty$ .

Suppose now that  $I_{\nabla} \equiv \int_D \phi[x, y(x), p(x)] dx$  is *PQR* and let  $L[x, y, p, \bar{p}]$  be one of the functions such that  $I_{\nabla}$  is *LPQR*.

The function

$$(1.8) \quad \bar{\phi}[x, y, p] = \mathcal{E}_L[x, y, \Omega, p],$$

where  $\Omega$  is an  $m \times n$  matrix whose elements are all 0, is never negative. Furthermore,

$$(1.9) \quad \bar{I}_{\nabla} = \int_D \bar{\phi}[x, y(x), p(x)] dx$$

is *LPQR*, where

$$(1.10) \quad \bar{L}[x, y, p, \bar{p}] = L[x, y, p, \bar{p}] - L[x, y, \Omega, \bar{p}].$$

By (1.6), the equation

$$\bar{\phi}[x, y, \Omega] = 0$$

holds for every  $X \in D$  and every  $y$ .

Let  $R$  denote a positive real number and let  $\varphi^R[x, y, p]$  denote a function such that the following conditions are satisfied:

I.  $\varphi^R[x, y, p]$  is continuous with all its partial derivatives of any of the forms

$$\frac{\partial \varphi^R[x, y, p]}{\partial p_r^s}, \quad \frac{\partial^2 \varphi^R[x, y, p]}{\partial p_r^s \partial p_r^t}, \quad \frac{\partial^{2q} \varphi^R[x, y, p]}{\prod_{i \leq q} \partial x_\zeta^{\mu(\zeta)} \partial p_\zeta^{\mu(\zeta)}}$$

## II. The integral

$$(1.11) \quad Y_V = \int_D \varphi^R[x, y(x), p(x)] dx$$

is  $PQR$ .

## III. The relation

$$(1.12) \quad 0 \leq \varphi^R[x, y, p] \leq \bar{\phi}[x, y, p]$$

holds for every  $y, p$  and for every  $x \in D$ ; furthermore,

$$(1.13) \quad \varphi^R[x, y, p] = \bar{\phi}[x, y, p], \quad \text{whenever } \sum_{i=1}^m \sum_{j=1}^n (p_i^j)^2 \leq R.$$

IV. There exists at least one function  $\Lambda[x, y, p, \bar{p}]$ , such that  $Y_V$  is  $\Lambda PQR$ , and such that there exists a number  $Q$ , for which the following condition is satisfied:

Let  $q, U_q, \zeta, \mu(\zeta)$  be defined as they were above; let  $\bar{U}_q$  denote the complement of  $U_q$  with respect to the set of the first  $m$  positive integers, and let  $\bar{\zeta}$  be an index ranging over  $\bar{U}_q$ . Then the inequality

$$|W_{\bar{U}_q, \mu}^R[x, y, p]| < Q \left( 1 + \prod_{\bar{\zeta} \in \bar{U}_q} |p_{\bar{\zeta}}^{\mu(\bar{\zeta})}| \right)$$

where  $W_{\bar{U}_q, \mu}^R[x, y, p]$  denotes the coefficient of the element

$$\prod_{\bar{\zeta} \in \bar{U}_q} [\bar{p}_{\bar{\zeta}}^{\mu(\bar{\zeta})} - p_{\bar{\zeta}}^{\mu(\bar{\zeta})}]$$

of the function  $\Lambda[x, y, p, \bar{p}]$ , holds for every  $q, U_q, p$ , for every  $x \in D$ , for every  $\mu$  and for every  $y$ , such that

$$|y_i| \leq T, \quad (i = 1, 2, \dots, n).$$

The integral  $I_V$  is said to be *asymptotically evaluable* [8, 12] (abbreviation:  $AE$ ) when there exists a function  $L[x, y, p, \bar{p}]$  such that  $I_V$  is  $LPQR$  and such that for every positive  $R$  there exists a function  $\varphi^R[x, y, p]$  as described above. By using continuity lemmas proved in [11], in [12] this author proved the following:

*Semicontinuity Theorem 1.1.* An integral  $I_V$  which is  $PQR$  and  $AE$  is lower semicontinuous at every variety  $V$ , ordinary or not. (See also [8, 13, 14]).

**REMARK 1.2.** If  $V$  is a nonordinary variety and  $I_V$  is  $PQR$ , the

lower semicontinuity of  $I_V$  at  $V$  denotes the fact that if  $\{V_i\}$  is any sequence of varieties such that

$$\lim_{i \rightarrow \infty} V_i = V,$$

then

$$\lim_{i \rightarrow \infty} I_{V_i} = +\infty.$$

DEFINITION. We shall say that an integral  $I_V \equiv \int_D \phi[x, y, p]dx$  is *alpha-asymptotic* if there exist two real numbers  $\alpha > 0$  and  $Y > 1$  such that

$$\phi(x, y, p) > \prod_{i=1}^m \sum_{j=1}^n |p_j^i|^{n+\alpha}$$

whenever

$$\prod_{i=1}^m \sum_{j=1}^n |p_j^i| > Y$$

and if  $\phi[x, y, p]$  is bounded below by a number  $H$ .

We shall say that a set  $F$  of varieties has the *property A* if there exist two real numbers  $\beta > 0$  and  $M$  such that for each  $V \equiv y(x) \in F$ ,

$$\int_D \prod_{i=1}^m \sum_{j=1}^n |p_j^i(x_i)|^{n+\beta} dx \leq M.$$

We shall say that  $F$  has the *property B* if there exist two real numbers  $\gamma > 0$  and  $N$  such that, for each  $V \equiv y(x) \in F$ ,

$$\int_D \sum_{j=1}^n |p_j^i(x_i)|^{n+\gamma} \leq N, \quad (i + 1, 2, \dots, m).$$

DEFINITION. A set  $\mathcal{F}$  of varieties is called a *regular class* if each set  $F \subset \mathcal{F}$  which has property A has also property B.

REMARK. For  $m = 1$ , every set of varieties is a regular class. If all the  $m$  pointsets  $D_i$  and the  $m$  components  $y_i(x_i)$  of a variety  $V$  are identical to each other, we shall say that  $V$  is *symmetric*. If  $\mathcal{F}$  consists only of symmetric varieties it is clearly a regular class: however, sets of symmetric varieties are only a very special case of regular classes. Clarifying examples of regular classes and regularity criteria were given in [9] for the case  $m = 2, n = 1$  (Fubini-Tonelli integrals).

DEFINITION. A set  $\mathcal{F}$  of ordinary varieties which contains all the ordinary varieties belonging to the boundary of  $\mathcal{F}$  is called a *complete class*.

EXAMPLES. Any closed set of varieties is a complete class. Both the set of all varieties and the set of all ordinary varieties are also complete classes.

2. **The existence of the minimum.** (a) The Problem of Tonelli consists of giving conditions on  $\phi[x, y, p]$  which yield the existence of the minimum of  $I_V$  in any regular complete class  $\mathcal{F}$  of varieties.

Only conditions on  $\phi[x, y, p]$  are allowed. In fact, several types of conditions on  $\mathcal{F}$  (such as uniform bounds of the  $m$ -gradients  $p(x)$  of the varieties of  $\mathcal{F}$  or of their integrals) would easily yield compactness of  $\mathcal{F}$  itself and a fortiori the existence of the minimum. However, no such condition is consistent with the physical phenomena that can be described mathematically as minima of integrals of the calculus of variation or with the use of solutions of Tonelli's problem as tools for investigating the existence of solutions of partial differential and integro-differential equations [5, 18]. Our purpose in this study is to discuss the existence of a minimum of  $I_V$  in classes  $\mathcal{F}$  of varieties which are not a priori compact, imposing conditions only on  $\phi[x, y, p]$ .

(b) **LEMMA 2.b.1.** *If  $I_V$  is alpha-asymptotic and bounded above on a set  $F$  of varieties, then  $F$  has property A.*

Let  $V \equiv y(x) \in F$ , and let  $K$  be the upper bound of  $I_V$  over  $F$ .

Let  $D_1$  denote the set of points  $x$  of  $D$  such that

$$(2.1) \quad \prod_{i=1}^m \sum_{j=1}^n |p_i^j(x_i)| \leq Y$$

and  $D_2$  the complement of  $D_1$  with respect to  $D$ . Then

$$\begin{aligned} \int_D \prod_{i=1}^m \sum_{j=1}^n |p_i^j(x_i)|^{n+\alpha} dx &\leq \int_{D_1} \prod_{i=1}^m \sum_{j=1}^n |p_i^j(x_i)|^{n+\alpha} dx \\ &+ \int_{D_2} \phi[x, y(x), p(x)] dx \leq (Y^{n+\alpha} + |H|)\mu(D) + K \end{aligned}$$

where  $\mu(D)$  denotes the measure of  $D$ .

The lemma is then proved simply by posing

$$M \equiv (Y^{n+\alpha} + |H|)\mu(D) + K \quad \text{and} \quad \beta \equiv \alpha.$$

Let now  $\{V_s^{(r)}\}$  ( $s = 0, 1, 2, \dots, m$ ) denote sequences ( $V_s^{(1)}, V_s^{(2)}, V_s^{(3)}, \dots$ ) of varieties and  $y_{i,s}^{(r)}(x_i)$  the  $i$ th component of  $V_s^{(r)}$ . Let us prove the following

*Compactness Theorem 2.b.2.* *If  $I_V$  is alpha-asymptotic and bounded above on  $\{V_0^{(r)}\}$  and  $\{V_0^{(r)}\}$  is contained in a regular class  $\mathcal{F}$ , then there exists a variety  $V^{(\infty)} \equiv y_i^{(\infty)}$  ( $i = 1, 2, \dots, m$ ) of accumulation for*

$\{V_0^{(r)}\}$ .

For Lemma 2.b.1  $\{V_0^{(r)}\}$  has the *property A*; since  $\{V_0^{(r)}\} \subset \mathcal{F}$  and  $\mathcal{F}$  is a regular class,  $\{V_0^{(r)}\}$  has also *property B*. Consequently, for each  $i$  ( $i = 1, 2, \dots, m$ ) the  $i$ th components  $y_{i,i-1}^{(r)}(x_i)$  of the varieties  $V_{i-1}^{(r)}$  are equiabsolutely continuous functions of the  $n$  variables  $x_i^j$ , and form a compact set with respect to the uniform (Tchebychev) metric, i.e., there is a sequence  $\{V_i^{(r)}\} \subset \{V_{i-1}^{(r)}\}$  and an absolutely continuous function  $y_i^{(\infty)}(x_i)$  such that for each  $\varepsilon > 0$  there is an  $\bar{r}$  such that

$$|y_i^{(\infty)}(x_i) - y_i^{(r)}(x_i)| < \varepsilon$$

whenever  $x_i \in D_i$  and  $r < \bar{r}$ . Consequently, in the metric of the space of varieties, the variety  $V^{(\infty)} \equiv y_i^{(\infty)}$  ( $i = 1, 2, \dots, m$ ) is a variety of accumulation for  $\{V_m^{(r)}\}$  and, since  $\{V_m^{(r)}\} \subset \{V_0^{(r)}\}$ , also of  $\{V_0^{(r)}\}$ . The theorem is thus proved.

We are now in a position to prove the following

**THEOREM 2.b.3 of Existence of the Minimum:** *If the integral  $I_r$  is positively quasi-regular, asymptotically evaluable and alpha asymptotic, then it has an absolute minimum in every regular complete class  $\mathcal{F}$  of ordinary varieties.*

Let  $i$  denote the lower bound of  $I_r$  over  $\mathcal{F}$ . Let us show that  $i$  is finite: indeed, if it were that

$$(2.2) \quad i = -\infty$$

there would exist a sequence  $\{Y^{(r)}\} \subset \mathcal{F}$  of varieties such that

$$(2.3) \quad I_r(r) < -r;$$

by the compactness Theorem 2.b.2 there would exist a variety  $V^{(\infty)}$  of accumulation for  $\{V^{(\infty)}\}$ . Since  $I_r$  is positively quasi-regular by hypothesis,  $I_r^\infty$  exists, and

$$(2.4) \quad I_{V^{(\infty)}} > -\infty$$

(see Remark 1.1).

But by the semicontinuity Theorem 1.1,  $I_r$  is lower semicontinuous at  $V^{(\infty)}$ ; (2.4) then contradicts (2.3): consequently (2.2) is false.

Let now  $\{V^{(r)}\}$  ( $b = 1, 2, \dots$ ) be a sequence of varieties of  $\mathcal{F}$  such that

$$I_r(r) < i + \frac{1}{r}.$$

By the compactness Theorem 2.b.2 there exists a variety  $V^{(\infty)}$  of accumulation for  $\{V^{(r)}\}$ ; semicontinuity Theorem 1.1 implies that  $V^{(\infty)}$  is

ordinary, because  $I_V$  is upper bounded on  $\{V^{(r)}\}$ ; hence, since  $\mathcal{F}$  is a complete class,  $V^{(\infty)} \in \mathcal{F}$ . Semicontinuity Theorem 1.1 also yields

$$I_{V^{(\infty)}} \leq \min \lim_{r \rightarrow \infty} I_V(r);$$

consequently

$$I_{V^{(\infty)}} = i$$

which completely proves Theorem 2.b.3.

REMARK. Particular cases of the theorem of existence of the minimum have been proved previously, by Tonelli [13, 15, 16,] in the case  $m = 1, n = 1$  (simple integrals) and  $m = 1, n = 2$  (double integrals), and by this author [9] in the case  $m = 2, n = 1$  (Fubini-Tonelli integrals). However this new general proof is considerably simpler than all those given in [9, 13, 15, 16].

(c) The concept of *regular class* needs discussion. In fact, this concept can only be accepted after proving that semicontinuous alpha-asymptotic integrals may not have any minimum in some complete classes of ordinary varieties which are not regular. This can be shown by means of the following example (see also [9]):

Let  $m = 2, n = 1, D_1 \equiv D_2 \equiv [0, \pi], \phi[x, y, p] \equiv (p_1^2 \cdot p_2^2)$ .  $I_V$  is lower semicontinuous and alpha asymptotic for any  $\alpha \leq 1$ . Consider the sequence  $V^{(r)}$ , ( $r = 1, 2, \dots$ ) of varieties whose components are

$$y_1(x) = \sin(rx_1) \quad \text{and} \quad y_2(x) = r^{-3} \sin(rx_2),$$

respectively;  $\{V^{(r)}\}$  is a complete class, because there are no varieties of accumulation. Each  $V^{(r)}$  is ordinary, and

$$I_V(r) = \int_0^\pi \int_0^\pi r^{-2} \cos^2(rx_1) \cos^2(rx_2) dx_1 dx_2 = \left(\frac{\pi}{r}\right)^2;$$

the lower bound of  $I_V$  over  $V^{(r)}$  is 0, but  $I_V$  never vanishes in  $\{V^{(r)}\}$ .

The fact that  $\{V^{(r)}\}$  is not a regular class can also be shown directly without difficulty.

# Pacific Journal of Mathematics

Vol. 12, No. 2

February, 1962

William George Bade and Robert S. Freeman, <i>Closed extensions of the Laplace operator determined by a general class of boundary conditions</i> . . . . .	395
William Browder and Edwin Spanier, <i>H-spaces and duality</i> . . . . .	411
Stewart S. Cairns, <i>On permutations induced by linear value functions</i> . . . . .	415
Frank Sydney Cater, <i>On Hilbert space operators and operator roots of polynomials</i> . . . . .	429
Stephen Urban Chase, <i>Torsion-free modules over <math>K[x, y]</math></i> . . . . .	437
Heron S. Collins, <i>Remarks on affine semigroups</i> . . . . .	449
Peter Crawley, <i>Direct decompositions with finite dimensional factors</i> . . . . .	457
Richard Brian Darst, <i>A continuity property for vector valued measurable functions</i> . . . . .	469
R. P. Dilworth, <i>Abstract commutative ideal theory</i> . . . . .	481
P. H. Doyle, III and John Gilbert Hocking, <i>Continuously invertible spaces</i> . . . . .	499
Shaul Foguel, <i>Markov processes with stationary measure</i> . . . . .	505
Andrew Mattei Gleason, <i>The abstract theorem of Cauchy-Weil</i> . . . . .	511
Allan Brasted Gray, Jr., <i>Normal subgroups of monomial groups</i> . . . . .	527
Melvin Henriksen and John Rolfe Isbell, <i>Lattice-ordered rings and function rings</i> . . . . .	533
Amnon Jakimovski, <i>Tauberian constants for the <math>[J, f(x)]</math> transformations</i> . . . . .	567
Hubert Collings Kennedy, <i>Group membership in semigroups</i> . . . . .	577
Eleanor Killam, <i>The spectrum and the radical in locally <math>m</math>-convex algebras</i> . . . . .	581
Arthur H. Kruse, <i>Completion of mathematical systems</i> . . . . .	589
Magnus Lindberg, <i>On two Tauberian remainder theorems</i> . . . . .	607
Lionello A. Lombardi, <i>A general solution of Tonelli's problem of the calculus of variations</i> . . . . .	617
Marvin David Marcus and Morris Newman, <i>The sum of the elements of the powers of a matrix</i> . . . . .	627
Michael Bahir Maschler, <i>Derivatives of the harmonic measures in multiply-connected domains</i> . . . . .	637
Deane Montgomery and Hans Samelson, <i>On the action of <math>SO(3)</math> on <math>S^n</math></i> . . . . .	649
J. Barros-Neto, <i>Analytic composition kernels on Lie groups</i> . . . . .	661
Mario Petrich, <i>Semicharacters of the Cartesian product of two semigroups</i> . . . . .	679
John Sydney Pym, <i>Idempotent measures on semigroups</i> . . . . .	685
K. Rogers and Ernst Gabor Straus, <i>A special class of matrices</i> . . . . .	699
U. Shukla, <i>On the projective cover of a module and related results</i> . . . . .	709
Don Harrell Tucker, <i>An existence theorem for a Goursat problem</i> . . . . .	719
George Gustave Weill, <i>Reproducing kernels and orthogonal kernels for analytic differentials on Riemann surfaces</i> . . . . .	729
George Gustave Weill, <i>Capacity differentials on open Riemann surfaces</i> . . . . .	769
G. K. White, <i>Iterations of generalized Euler functions</i> . . . . .	777
Adil Mohamed Yaqub, <i>On certain finite rings and ring-logics</i> . . . . .	785
