COMBINATORIAL FUNCTIONS AND REGRESSIVE ISOLS

F. J. SANSONE

- 1. Introduction. It is assumed that the reader is familiar with the notions: regressive function, regressive set, regressive isol, cosimple isol, combinatorial function and its canonical extension. The first four are defined in [2], the last two in [3]. Denote the set of all numbers (nonnegative integers) by ε , the collection of all isols by Λ , the collection of all regressive isols by Λ and the collection of all cosimple isols by Λ . The following four propositions will be used.
- (1) $\begin{cases} \text{Let } \tau = \rho t \text{ and } \tau^* = \rho t^*, \text{ where } t_n \text{ and } t_n^* \text{ are regressive } \\ \text{functions.} & \text{Then } \tau \cong \tau^* \longleftrightarrow t_n \cong t_n^* \end{cases}$
- $(2) B \leq A \& A \in A_R \Longrightarrow B \in A_R.$
- (3) $\begin{cases} \text{Let } F(T) \text{ be the canonical extension to } \Lambda \text{ of the recursive,} \\ \text{combinatorial function } f(n). \text{ Then } T \in \Lambda_R \longrightarrow F(T) \in \Lambda_R . \end{cases}$

$$(4) B \leq A \& A \in \Lambda_1 \Longrightarrow B \in \Lambda_1.$$

The first three are Propositions 3, 9(b) and Theorem 3(a) of [2] respectively. The fourth is Theorem 56(b) of [1].

DEFINITION. Let f(n) be a one-to-one function from ε into ε and let $T \in A_R - \varepsilon$. Then

$$\phi_f(T) = \operatorname{Reg} \rho t_{f(n)}$$

where t_n is any regressive function ranging over any set in T.

Using (1) it is readily seen that ϕ_f is a well defined function from $\Lambda_R - \varepsilon$ into $\Lambda - \varepsilon$. The main result of this paper is as follows: Let f(n) be a strictly increasing, recursive, combinatorial function; let F(X) be its canonical extension to Λ , and let $T \in \Lambda_R - \varepsilon$; then $\phi_f(F(T)) = T$.

2. The operation ϕ_f .

PROPOSITION 1. Let f(n) be a strictly increasing, recursive function and let $T \in \Lambda_R - \varepsilon$. Then

$$\phi_f(T) \leq T$$
 and $\phi_f(T) \in A_R$.

February 15, 1963. This paper was written while the author was a National Defense Graduate Fellow at Rutgers University and is a portion of a thesis directed by Professor J. C. E. Dekker to submitted as partial fulfillment of the requirements for the degree of Doctor of Philosophy.

If in addition $T \in \Lambda_1$, then $\phi_f(T) \in \Lambda_R \cdot \Lambda_1$.

Proof. In view of (2) and (4), it suffices to show only that $\phi_f(T) \leq T$. Let t_n be a regressive function such that $\rho t = \tau \in T$. Put $\alpha = \rho f$ and suppose p(x) is a regressing function of t_n . Define

$$p^*(x) = (\mu y)[p^{y+1}(x) = p^y(x)]$$
 for $x \in \delta p$.

Then $p^*(t_n) = n$ and

$$ho t_{ au} \subset \{x \in \delta p^* \mid p^*(x) \in lpha \}$$
 , $au -
ho t_{ au} \subset \{x \in \delta p^* \mid p^*(x)
otin lpha \}$.

Since α is recursive it follows that ρt_f is separable from $\tau - \rho t_f$. Hence $\phi_f(T) \leq T$.

It is known (by an unpublished result of Dekker) that Λ_R is neither closed under addition nor under multiplication. We do, however, have some closure properties for isols of the type $\phi_f(T)$, where $T \in \Lambda_R - \varepsilon$ and f(n) is a strictly increasing, recursive function.

PROPOSITION 2. Let f(n) and g(n) be strictly increasing, recursive function and let $T \in A_R - \varepsilon$. Then

- (a) $\phi_f(\phi_g(T)) \in \Lambda_R \varepsilon$,
- (b) $\phi_f(T) \cdot \phi_g(T) \in A_R \varepsilon$,
- (c) $\phi_f(T) + \phi_g(T) \in \Lambda_R \varepsilon$.

Proof. In view of Proposition 1,

$$\phi_f(\phi_g(T)) \leq \phi_g(T) \leq T$$
.

This implies (a). To verify (a) one could also observe that $\phi_f(\phi_g(T)) = \phi_{gf}(T)$. Combining $\phi_f(T) \leq T$ and $\phi_g(T) \leq T$, we obtain by [1, Cor. of Thm. 77]

$$\phi_{f}(T) \cdot \phi_{g}(T) \leq T^{2}$$
.

However, $T^2 \in A_R - \varepsilon$ by (3). Hence (b) follows by (2). Finally, it is readily seen that

$$\phi_{\mathit{f}}(T) + \phi_{\mathit{g}}(T) \leqq \phi_{\mathit{f}}(T) \! \cdot \! \phi_{\mathit{g}}(T)$$
 ,

since $\phi_f(T)$ and $\phi_g(T)$ are ≥ 2 (in fact, infinite). Thus (c) follows from (2) and (b).

3. The main result. We first state and prove two lemmas which might be of interest for their own sake. Let ρ_0, ρ_1, \cdots be the canonical enumeration of the class Q of all finite sets defined by

$$\rho_0 = a$$

$$ho_{x+1} = egin{cases} (y_1, \, \cdots, \, y_k) & ext{where } y_1, \, \cdots, \, y_k & ext{are the distinct numbers} \\ ext{such that } x + 1 = 2^{y_1} + \cdots + 2^{y_k} \ . \end{cases}$$

We denote the cardinality of ρ_x by r_x .

LEMMA 1. Let f(n) be any combinatorial function and let C_i be the function from ε into ε such that $f(n) = \sum_{i=0}^n c_i \binom{n}{i}$. Then

$$f(n) = \sum_{r=0}^{2^{n}-1} c_{r(x)}$$
.

Proof. Since every *n*-element set has $\binom{n}{i}$ subsets of cardinality i, we have

(5)
$$f(n) = \operatorname{card} \{j(x, y) \mid \rho_x \subset (0, 1, \dots, n-1) \& y < c_{r(x)} \}.$$

It follows from the definition of ρ_x that

$$ho_x \subset (0, 1, \cdots, n-1) \Longleftrightarrow x \leq 2^{\scriptscriptstyle 0} + 2^{\scriptscriptstyle 1} + \cdots + 2^{\scriptscriptstyle n-1} \ \Longleftrightarrow x \leq 2^{\scriptscriptstyle n} - 1$$
 .

Combining this with (5) we obtain

$$f(n) = \operatorname{card} \left\{ j(x, y) \, | \, x \leq 2^n - 1 \, \& \, y < c_{r(x)}
ight\} = \sum_{x=0}^{2^n - 1} c_{r(x)} \; .$$

DEFINITION. Let a(n) be a one-to-one function from ε into ε . Then

$$a'(n) = l_{n0} \cdot 2^{a(0)} + \cdots + l_{nn} \cdot 2^{a(n)}$$
,

where l_{n0}, \dots, l_{nn} is the sequence of zeros and ones such that

$$n = l_{n0} \cdot 2^0 + \cdots + l_{nn} \cdot 2^n$$
.

LEMMA 2. (Dekker) Let a(n) be a one-to-one function from ε into ε with range α and let $A = \text{Req}(\alpha)$. Then a'(n) is also a one-to-one function from ε into ε . Moreover,

$$a'(2^n)=2^{a(n)}$$
 , $ho_{a'(n)}=a(
ho_n)$ and $ho a'\in 2^A$.

Finally, if a(n) is regressive, so is a'(n).

Proof. It is clear that a'(n) is a one-to-one function such that $a'(2^n) = 2^{a(n)}$. We have $\rho_{a'(0)} = \rho_0 = o$ while $a(\rho_0) = a(o) = o$; for $n \ge 1$

$$\rho_n = \{i \mid 0 \le i \le n \& l_{ni} = 1\}$$

Hence for every number n

$$\rho_{a'(n)} = \{a(i) \mid 0 \le i \le n \& l_{ni} = 1\}$$

$$= a\{i \mid 0 \le i \le n \& l_{ni} = 1\} = a(\rho_n).$$

Thus, if n ranges over ε , ρ_n ranges over the class Q of all finite sets, $\rho_{a'(n)} = a(\rho_n)$ over the class of all finite subsets of α . We conclude that $\rho a' \in 2^4$. Finally, assume that a(n) is a regressive function. Using the three facts that

$$a'(n+1) = l_{n+1,0} \cdot 2^{a(0)} + \cdots + l_{n+1,n+1} \cdot 2^{a(n+1)}$$
, $a'(n) = l_{n_0} \cdot 2^{a(0)} + \cdots + l_{n_n} \cdot 2^{a(n)}$, $\max\{i \mid l_{n_i} = 1\} \le \max\{i \mid l_{n+1,i} = 1\}$,

we infer that a'(n) is a regressive function.

THEOREM. Let f(n) be a strictly increasing, recursive combinatorial function, let F(X) be its canonical extension to Δ and let $T \in \Lambda_R - \varepsilon$. Then $\phi_f(F(T)) = T$.

Proof. Let $f(n) = \sum_{i=0}^n c_i \binom{n}{i}$ be the strictly increasing, recursive, combinatorial function. Then $c_1 > 0$ since f(n) is strictly increasing, and c_i is a recursive function of i, since f(n) is recursive. Let $\tau \in T \in A_R - \varepsilon$ and assume that t_n is a regressive function ranging over τ . Put g(n) = t'(n). By Lemma 2 we have $\rho_{g(n)} = t(\rho_n)$; thus, if n assumes successively the values $0, 1, 2, 3, 4, 5, 6, 7, \cdots, \rho_{g(n)}$ assumes successively the "values"

$$o, (t_0), (t_1), (t_0, t_1), (t_2), (t_0, t_2), (t_1, t_2), (t_0, t_1, t_2), \cdots$$

We have by definition

$$F(T) = \text{Reg} \{ j(x, y) | \rho_x \subset \tau \& y < c_{r(x)} \}.$$

Since g(n) ranges without repetitions over $\{n \mid \rho_n \subset \tau\}$, it follows that

(6)
$$F(T) = \text{Reg} \{ j(g(x), y) | y < c_{r(x)} \}.$$

We shall use w_n to denote the function which for $0, 1, \cdots$ takes on the values of the array

$$egin{aligned} j(g(0),\,0),\,\,\cdots,\,j(g(0),\,c_{r_{(0)}}-1) \ j(g(1),\,0),\,\,\cdots,\,j(g(1),\,c_{r_{(1)}}-1) \ j(g(2),\,0),\,\,\cdots,\,j(g(2),\,c_{r_{(2)}}-1) \ dots \end{aligned}$$

reading from the left to the right in each row and from the top row down; it is understood that every row which starts with j(g(k), 0) for

some k with $c_{r(k)}=0$ is to be deleted. From the definitions of ho_k and r(k) we see that

$$k \in (2^0, 2^1, 2^2, \cdots) \Longrightarrow r(k) = 1 \Longrightarrow c_{r(k)} = c_1 > 0$$
.

The function g(n) = t'(n) is regressive by Lemma 2. Taking into account that c_i is a recursive function, it readily follows that w_n is a regressive function. In view of (6) we have $\rho w_n \in F(T)$ it therefore suffices to prove that $\rho w_{f(n)} \in T$. By Lemma 1

$$f(n) = \sum_{x=0}^{2^{n}-1} c_{r(x)}$$
,

hence

$$f(0)=c_{r_{(0)}}$$
 , $f(1)=c_{r_{(0)}}+c_{r_{(1)}}$, $f(2)=c_{r_{(0)}}+c_{r_{(1)}}+c_{r_{(2)}}+c_{r_{(3)}}$, \cdots and

$$w_{f(0)}=j(g(1),\,0)$$
 , $w_{f(1)}=j(g(2),\,0),\,\cdots$, $w_{f(n)}=j(g(2^n),\,0),\,\cdots$.

We conclude that $w_{f(n)} \cong g(2^n)$. However, by Lemma 2

$$g(2^n)=t'(2^n)\cong t(n).$$

Thus $w_{f(n)} \cong t_n$ and $\rho w_{f(n)} \in T$. This completes the proof.

Mathematical papers intended for publication in the Pacific Journal of Mathematics should be typewritten (double spaced), and the author should keep a complete copy. Manuscripts may be sent to any one of the four editors. All other communications to the editors should be addressed to the managing editor, L. J. Paige at the University of California, Los Angeles 24, California.

50 reprints per author of each article are furnished free of charge; additional copies may be obtained at cost in multiples of 50.

The Pacific Journal of Mathematics is published quarterly, in March, June, September, and December. Effective with Volume 13 the price per volume (4 numbers) is \$18.00; single issues, \$5.00. Special price for current issues to individual faculty members of supporting institutions and to individual members of the American Mathematical Society: \$8.00 per volume; single issues \$2.50. Back numbers are available.

Subscriptions, orders for back numbers, and changes of address should be sent to Pacific Journal of Mathematics, 103 Highland Boulevard, Berkeley 8, California.
