# THE TRANSCENDENTAL RANK OF A THEORY

### ALISTAIR H. LACHLAN

# Morley has associated with each countable complete theory T an ordinal $\alpha_T < (2^{\aleph_0})^+$ . It is shown that in fact $\alpha_T \leq \omega_1$ and that this bound is best possible.

We shall use the notation and terminology of Morley [1], where  $\alpha_T$  is defined to be the least ordinal  $\alpha$  such that for all  $A \in N(T)$  and all  $\beta > \alpha$ ,  $S^{\alpha}(A) = S^{\beta}(A)$ . As in [1] T denotes a complete theory in a countable language L, T has an infinite model, and there is a theory  $\Sigma$  such that  $T = \Sigma^*$ . If  $A \in N(T)$  and  $p \in S(A)$ , let  $r(p) = \alpha$  if p is transcendental in rank  $\alpha$  and let r(p) be undefined otherwise. Also, if  $A \in N(T)$  and  $\psi \in F(A)$  define

$$r(\psi, A) = egin{cases} -1 & ext{if} & U_{\psi} = arnothing \ \sup\left\{lpha \mid p \in U_{\psi} \ \& \ r(p) = lpha
ight\} & ext{otherwise.} \end{cases}$$

LEMMA. Let  $A \in N(T)$ ,  $\psi \in F(A)$ , and  $r(\psi, A) = \alpha$ . Then for each  $\beta < \alpha$  there exists  $B \in N(T)$ ,  $A \subseteq B$ , and  $q \in S(B)$  such that  $r(q) = \beta$  and  $\psi \in q$ .

*Proof.* Assume the hypothesis and for contradiction that no B and q exist satisfying the conclusion. Then for every  $B \in N(T)$ ,  $A \subseteq B$ , we have  $i_{AB}^{*-1}(U_{\psi}) \cap Tr^{\beta}(B) = \emptyset$ . Thus for all such B,  $i_{AB}^{*-1}(U_{\psi}) \cap (S^{\beta+1})(B) - S^{\beta}(B)) = \emptyset$ . Suppose  $q' \in Tr^{\beta+1}(B)$  then for every  $C \in N(T)$ ,  $B \subseteq C$ ,  $i_{BC}^{*-1}(q') \cap S^{\beta+1}(C)$  is a set of isolated points in  $S^{\beta+1}(C)$ . Thus, if  $\psi \in q'$ ,  $i_{BC}^{*-1}(q') \cap S^{\beta}(C)$  is a set of isolated points in  $S^{\beta}(C)$  for all such C, whence  $q' \in Tr^{\beta}(B)$ . We conclude that  $i_{AB}^{*-1}(U_{\psi}) \cap Tr^{\beta+1}(B) = \emptyset$  for all  $B \in N(T)$ ,  $A \subseteq B$ . By induction  $i_{AB}^{*-1}(U_{\psi}) \cap Tr^{\gamma}(B) = \emptyset$  for all  $\gamma \geq \beta$ . This contradicts the hypothesis and completes the proof of the lemma.

From 2.3(b) and 2.4 of [1] it is possible to choose B in the conclusion of the lemma such that  $\kappa(B-A) = \aleph_0$ ; we shall make use of this fact below.

Before proceeding further we need some more definitions. A language  $L_1$  is said to be a simple extension of a language  $L_0$  if it is obtained by adjoining  $\aleph_0$  individual constants to  $L_0$ . For any language L' let F(L') denote the set of formulas of L' which have no free variable other than  $v_0$ . For each  $n \in \omega$  let  $S_n$  denote the set of all sequences of 0's and 1's of length  $\leq n$ ; the empty sequence  $\emptyset$  is allowed. For  $s \in S_n$  and  $i \leq 1, s*\langle i \rangle$  denotes the member of  $S_{n+1}$ 

obtained by juxtaposing *i* to the right of *s*. A map  $\psi: S_n \to F(L)$  is called *admissible* if either n = 0, or n > 0 and for each  $s \in S_m$ ,  $0 \leq m < n$  there exists  $\varphi \in F(L)$  such that  $\psi(s*\langle 0 \rangle) = \psi(s) \& \varphi$  and  $\psi(s*\langle 1 \rangle) = \psi(s) \& \neg \varphi$ . The main step in our proof is:

PROPOSITION. Let  $A \in N(T)$ ,  $\kappa(A) \leq \aleph_0$ , and  $n \in \omega$ . Let  $\psi_n : S_n \to F(L_n)$  be an admissible map, where  $L_n$  is a simple extension of L(A), such that for every  $\alpha < \omega_1$  there exists  $B_n^{\alpha} \in N(T)$  with  $A \subseteq B_n^{\alpha}$  and  $L(B_n^{\alpha}) = L_n$  such that for all  $s \in S_n$   $r(\psi_n(s), B_n^{\alpha}) \geq \alpha$ . Then there exists a language  $L_{n+1}$ , which is a simple extension of  $L_n$  and an admissible map  $\psi_{n+1} : S_{n+1} \to F(L_{n+1})$  extending  $\psi_n$  such that for every  $\alpha < \omega_1$  there exists  $B_{n+1}^{\alpha} \in N(T)$  with  $A \subseteq B_{n+1}^{\alpha}$  and  $L(B_{n+1}^{\alpha}) = L_{n+1}$  such that for all  $s \in S_{n+1}$ ,  $r(\psi_{n+1}(s), B_{n+1}^{\alpha}) \geq \alpha$ .

Proof. Form  $L_{n+1}$  by adjoining a countable number of new individual constants to  $L_n$ . Consider a fixed ordinal  $\alpha < \omega_1$ . By  $2^{n+1}$  applications of the lemma we can find  $C^{\alpha} \in N(T)$  with  $B_n^{\alpha+2} \subseteq C^{\alpha}$  and  $L(C^{\alpha}) = L_{n+1}$  such that for each  $s \in S_n - S_{n-1}$  there exist  $p_0(s), p_1(s) \in S(C^{\alpha})$  both containing  $\psi_n(s)$  such that  $r(p_0(s)) = \alpha$  and  $r(p_1(s)) = \alpha + 1$ . For each  $s \in S_n - S_{n-1}$  choose  $\varphi^{\alpha}(s) \in p_0(s) - p_1(s)$ . Define  $\psi^{\alpha} : S_{n+1} \rightarrow F(L_{n+1})$  to be the extension of  $\psi_n$  such that for each  $s \in S_n - S_{n-1}$ ,  $\psi^{\alpha}(s*\langle 0 \rangle) = \psi_n(s) \& \varphi^{\alpha}(s)$  and  $\psi^{\alpha}(s*\langle 0 \rangle) = \psi_n(s) \& \neg \varphi^{\alpha}(s)$ . Letting  $\psi_{n+1} = \psi^{\alpha}$  and  $B_{n+1}^{\alpha} = C^{\alpha}$  the conclusion of the lemma holds for  $\alpha$ . Perform the construction of  $\psi^{\alpha}$  for each  $\alpha < \omega_1$ . Since  $L_{n+1}$  is countable the set  $\{\psi^{\alpha} \mid \alpha < \omega_1\}$  is countable. Hence there is a cofinal subset  $\Gamma$  of  $\omega_1$  such that  $\psi^{\gamma}$  for  $\gamma \in \Gamma$ . For each  $\alpha < \omega_1$  let  $\gamma$  be the least member of  $\Gamma$  such that  $\alpha < \gamma$  and define  $B_{n+1}^{\alpha} = C^{\gamma}$ . This completes the proof of the proposition.

Let  $S_{\omega}$  denote the set of all finite sequences of 0's and 1's. A sequence  $\langle s_i \rangle_{i < \omega}$  of members of  $S_{\omega}$  is called *regular* if  $s_0 = \emptyset$  and for all  $i < \omega$ ,  $s_{i+1}$  is either  $s_i * \langle 0 \rangle$  or  $s_i * \langle 1 \rangle$ . Now let  $A \in N(T)$  with  $\kappa(A) \leq \aleph_0$ , and let  $p \in S(A)$  with  $r(p) = \omega_1$ . Choose  $\varphi \in F(A)$  such that  $U_{\varphi} \cap S^{\omega_1}(A) = \{p\}$ . Let  $L_0$  be L(A) and define  $\psi_0 : S_0 \to F(L_0)$  by  $\psi_0(\emptyset) = \varphi$  then  $\varphi_0$  is admissible. Apply the proposition repeatedly to form  $L_1, L_2, \cdots$  and  $\psi_1, \psi_2, \cdots$ . Let  $L_{\omega} = U_{n < \omega} L_n$  and let  $\psi = \lim_{n < \omega} \psi_n$ where  $\psi$  maps  $S_{\omega}$  into  $F(L_{\omega})$ . By the compactness theorem there exists  $B \in N(T)$  such that  $A \subseteq B$ ,  $\kappa(B) = \aleph_0$ ,  $L(B) = L_{\omega}$ , and such that if  $\langle s_i \rangle_{i < \omega}$  is a regular sequence in  $S_{\omega}$  then  $\{\psi(s_i) | i < \omega\} \subseteq q$  for some  $q \in S(B)$ . Let  $s \in S_{\omega}$  then it is clear that the basic open set  $U_{\psi(s)}$  of S(B) has power  $2^{\aleph_0}$ . Also, since  $\kappa(B) = \aleph_0$ , for every  $\alpha S^{\alpha+1}(B) - S^{\alpha}(B)$ is countable. Thus  $U_{\psi(s)} \cap S^{\alpha}(B) \neq \emptyset$  for all  $\alpha < \omega_1$ . Since  $S^{\alpha}(B)$  is closed and decreasing with  $\alpha$ ,  $U_{\psi(s)} \cap S^{\omega_1}(B) \neq \emptyset$ . It follows immediately that  $\kappa(U'_{\varphi} \cap S^{\omega_1}(B)) \geq \aleph_0$  where  $U'_{\varphi}$  denotes the basic open set of S(B) determined by  $\varphi$ . From 2.3(b) of [1]  $i^*_{AB}(S^{\omega_1}(B)) = S^{\omega_1}(A)$ . Since  $i^*_{AB}(U'_{\varphi}) = U_{\varphi}$  it follows that  $i^{*-1}_{AB}(p) = U'_{\varphi} \cap S^{\omega_1}(B)$ . But this contradicts  $r(p) = \omega_1$  because  $U'_{\varphi} \cap S^{\omega_1}(B)$  having power  $\geq \aleph_0$  is not a set of isolated points.

Since  $Tr^{\alpha}(A) \neq \emptyset$  for some finite  $A \in N(T)$  if for any  $A \in N(T)$ , we have shown that  $Tr^{\omega_1}(A) = \emptyset$  for every  $A \in N(T)$ . It follows easily that  $S^{\beta}(A) = S^{\omega_1}(A)$  for every  $\beta > \omega_1$  and every  $A \in N(T)$ . Thus  $\alpha_T \leq \omega_1$  and our main theorem is proved.

We shall now construct a theory T such that  $\alpha_T = \omega_1$ .<sup>1</sup> In Example III of § 2 of [1] Morley showed how to construct a theory  $T_{\beta}$  for any  $\beta < \omega_1$  such that  $\alpha_{T_{\beta}} = \beta + 1$  and such that  $L(T_{\beta}) =$  $\{R_n \mid n < \omega\}$  where each  $R_n$  is a unary relation symbol. For  $\beta < \omega_1$ let  $A_{\beta}$  be a model of  $T_{\beta}$ . Suppose without loss that the sets  $|A_{\beta}|$ ,  $\beta < \omega_1$ , are pairwise disjoint and each disjoint from  $\omega_1$ . Now let Abe the relational system such that  $|A| = \omega_1 \cup_{\beta < \omega_1} |A_{\beta}|$  and define relations  $R^A$ ,  $R_0^A$ ,  $R_1^A$ ,  $\cdots$  as follows: for all  $x, y \in |A|$ 

and

and

$$R^{\scriptscriptstyle A}(x,\,y) \Longleftrightarrow x \in \omega_{\scriptscriptstyle 1} \,\&\, y \in |\,A_x|$$

$$R_n^A(y) \longleftrightarrow \bigvee x(x \in \omega_1 \& y \in R_n^{A_x})$$
.

If T is the theory of the system A then it is easy to see that  $\alpha_{T} = \omega_{1}$ .

In fact  $\alpha_T$  can have as its value any ordinal  $\leq \omega_1$  other than 0. From the examples to be found above it is sufficient to treat the case in which  $\beta$  is a limit ordinal  $\langle \omega_1$ . Let  $\langle \beta_n \rangle_{n < \omega}$  be a strictly increasing sequence with limit  $\beta$ . Let  $T^*$  be the theory with the same language as  $T_{\beta}$  above such that if A is any model of  $T^*$  and F, G are disjoint finite subsets of  $\omega$  then

$$\bigcap \{R_n^A \mid n \in F\} \cap \bigcap \{|A| - R_n^A \mid n \in G\} \neq \emptyset.$$

Choose axioms  $\psi_0, \psi_1, \cdots$  for  $T^*$  which are all existential, this is easy to do. For each n modify the theory  $T_{\beta_n}$  to obtain a theory  $T'_n$  whose transcendental rank is  $\beta_n + 1$  and which has  $\psi_0, \psi_1, \cdots, \psi_{n-1}$  amongst its theorems. For each  $n < \omega$  let  $A_n$  be a model of  $T_n$ . Suppose that the sets  $|A_n|, n < \omega$ , are pairwise disjoint and disjoint from  $\omega$ . Now let A be the relational system such that  $|A| = \omega \cup \bigcup_{n < \omega} |A_n|$ with relations  $R^A, R^A_0, R^A_1, \cdots$  defined by

$$R^{\scriptscriptstyle A}(x, y) \longleftrightarrow x \in \omega \& y \in |A_x|$$

$$R_n^A(y) \longleftrightarrow \mathbf{V} x(x \in \omega \& y \in R_n^{A_x})$$
.

<sup>&</sup>lt;sup>1</sup> The referee informs me that similar examples have been found independently by several people.
