**Let  $R$  be an integral domain containing the rational numbers,  $K$  its quotient field and  $\Omega$  an algebraic closure of  $K$ ; let  $D$  be a derivation on  $R$  such that  $R$  is  $D$ -simple. The valuation rings  $V$  such that  $R \subseteq V \subseteq \Omega$  on which  $D$  is regular are determined.**

**Introduction.** Let  $R'$  be the complete integral closure of  $R$  in  $K$ . Seidenberg has shown that  $D$  is regular on  $R'$  [3]. We want here to continue his work and determine all the valuation rings  $V$  such that  $R \subseteq V \subseteq \Omega$  on which  $D$  is regular.

First we determine in paragraph 2 the valuation rings of  $K$  that have property, and we show that they are in 1-1 correspondence with the proper prime ideals of  $R$ .

Then, in paragraph 4 we show that if  $V$  is a valuation ring such that  $R \subseteq V \subseteq \Omega$ , then  $D$  is regular on  $V$  if and only if  $V$  is unramified over  $K$  and  $D$  is regular on  $V \cap K$ . To do that, we have to show first in paragraph 3 that if  $B$  is a valuation ring of  $\Omega$  such that  $B \cap K$  is rank-1 discrete and contains the rational numbers, then its inertia field over  $K$  can be obtained as the intersection of a formal power series field with  $\Omega$ .

**1. Preliminaries.** Let  $R$  be a commutative ring with identity. A derivation  $D$  of  $R$  is a map from  $R$  into  $R$  such that  $D(a + b) = D(a) + D(b)$  and  $D(ab) = aD(b) + bD(a)$  for all  $a, b \in R$ . An ideal  $I$  of  $R$  is a  $D$ -ideal if  $D(I) \subseteq I$ ;  $R$  is  $D$ -simple if it has no  $D$ -ideal other than  $(0)$  and  $(1)$ . If  $R$  is a  $D$ -simple ring of characteristic  $p \neq 0$ ,  $R$  is a primary ring [2, Theorem 1.4], hence is equal to its total quotient ring; this case will not be of interest in our considerations.

Thus, let  $R$  be a  $D$ -simple ring of characteristic 0, which is then a domain containing the rational numbers [2, Corollary 1.5]; let  $K$  be its quotient field and  $\Omega$  an algebraic closure of  $K$ . The derivation  $D$  can be uniquely extended to a derivation of  $\Omega$ , which we also call  $D$ , and if  $N$  is any field between  $K$  and  $\Omega$ , we have  $D(N) \subseteq N$  [6, Corollary 2', p. 125]. If  $S$  is a ring with quotient field  $N$  such that  $D(S) \subseteq S$ , we shall say that  $D$  is regular on  $S$ , or that  $(N, S)$  is  $D$ -regular, or that  $D$  can be extended to  $S$ .

We note that if  $D$  is regular on a ring  $S$  and if  $M$  is a multiplicative system of  $S$ , then  $D$  is regular on  $S_M$ . We note also that if  $R$  is  $D$ -simple, and if  $S$  is a ring such that  $R \subseteq S \subseteq \Omega$ , then to say that

$D$  is regular on  $S$  is equivalent to saying that  $S$  is  $D$ -simple, indeed:

**PROPOSITION 1.1.** *Let  $R$  be a  $D$ -simple ring with quotient field  $K$ ; let  $\Omega$  be an algebraic closure of  $K$ , and  $S$  a ring such that  $R \subseteq S \subseteq \Omega$ . If  $D$  is regular on  $S$ , then  $S$  is  $D$ -simple.*

*Proof.* It will be enough to show that if  $I$  is a nonzero ideal of  $S$ , then  $I \cap R$  is a nonzero ideal of  $R$ . Let  $0 \neq x \in I$ , and let  $X^n + k_1 X^{n-1} + \dots + k_n \in K[X]$  be its minimal polynomial over  $K$  where we note that  $k_n \neq 0$ ; then, from the equality  $x^n + k_1 x^{n-1} + \dots + k_n = 0$ , we can get  $r_0 x^n + r_1 x^{n-1} + \dots + r_n = 0$  with  $r_i \in R \subseteq S$  for  $i = 0, 1, \dots, n$ , and  $r_n \neq 0$ , so that we have  $0 \neq -r_n = r_0 x^n + r_1 x^{n-1} + \dots + r_{n-1} x \in I \cap R$ .

Let  $L$  be a field,  $N$  an algebraic extension of  $L$ , and  $V$  a valuation ring of  $N$ . We shall denote the inertia degree of  $V$  over  $L$  by  $f(V|L)$ , and the ramification index of  $V$  over  $L$  by  $e(V|L)$ . If  $A$  is a valuation ring of  $L$ , following Endler's terminology in [1], we shall say that  $A$  is indecomposed in  $N$  if there is only one valuation ring of  $N$  lying over  $A$ , and, when  $N$  is a finite extension of  $L$ , we shall say that  $A$  is defectless in  $N$  if  $[N:L] = \sum_{i=1}^m e(V_i|L) f(V_i|L)$  where  $\{V_1, \dots, V_m\}$  is the set of valuation rings of  $N$  lying over  $A$ .

An ideal  $I$  of a ring  $S$  will be said to be proper if it is different from  $S$ . We shall use  $D^{(0)}(x)$  to denote  $x$ , and for  $n \geq 1$ ,  $D^{(n)}(x)$  to denote  $D(D^{(n-1)}(x))$ , i.e., the  $n$ th derivative of  $x$ .

## 2. Extensions of the derivation in the quotient field.

**LEMMA 2.1.** *Let  $R$  be a ring,  $D$  a derivation on  $R$ ,  $P$  a prime ideal of  $R$  containing no  $D$ -ideal other than  $(0)$ . Define  $v: R \setminus \{0\} \rightarrow \{\text{nonnegative integers}\}$  by  $v(x) = n$  if  $D^{(i)}(x) \in P$  for  $i = 0, \dots, n-1$  and  $D^{(n)}(x) \notin P$ . Then,*

- (i)  $R$  is a domain.
- (ii)  $v$  is the trivial valuation if  $P = (0)$ , and is a rank-1 discrete valuation if  $P \neq (0)$ .
- (iii) The valuation ring  $R_v$  of  $v$  contains  $R$ , and its maximal ideal  $\mathfrak{M}_v$  lies over  $P$ .

*Proof.* See [2, Theorem 3.1]. Note that for  $x \in R \setminus \{0\}$  we indeed have  $v(x) < \infty$  for otherwise the ideal generated by  $\bigcup_{i=0}^{\infty} D^{(i)}(x)$  would be a nonzero  $D$ -ideal contained in  $P$ , which cannot be. Note also that the property for  $P$  to contain no  $D$ -ideal other than  $(0)$  is equivalent to  $R_P$  being  $D$ -simple.

**LEMMA 2.2.** *Let  $R, D, P, v, R_v, \mathfrak{M}_v$  be as in 2.1. Let  $K$  be the*

quotient field of  $R$ . Let  $S$  be a ring between  $R$  and  $K$  such that  $D$  is regular on  $S$ . Then, the following statements are equivalent:

- (i)  $S \subseteq R_v$ .
- (ii) There is a prime ideal  $Q$  of  $S$  lying over  $P$ .

In this case,  $Q$  is the only prime ideal of  $S$  lying over  $P$  and is equal to  $\mathfrak{M}_v \cap S$ .

*Proof.* If  $S \subseteq R_v$ , take  $Q = \mathfrak{M}_v \cap S$ . Conversely, suppose there exists a prime ideal  $Q$  of  $S$  such that  $Q \cap R = P$ . Being regular on  $S$ ,  $D$  is also regular on  $S_Q$ ; furthermore,  $S_Q \supseteq R_P$ , and  $R_P$  is  $D$ -simple, thus by 1.1  $S_Q$  is  $D$ -simple. Then, by 2.1, we can define a valuation  $w: S \setminus \{0\} \rightarrow \{\text{nonnegative integers}\}$  by  $w(y) = m$  if  $D^{(j)}(y) \in Q$  for  $j = 0, \dots, m-1$  and  $D^{(m)}(y) \notin Q$ ; calling  $S_w$  the valuation ring of  $w$ , we have  $S \subseteq S_w$ . At the same time, we will have the valuation  $v$  defined with the prime ideal  $P$  of  $R$ , and for an element  $x \in R \setminus \{0\}$  we have  $D^{(i)}(x) \in P$  if and only if  $D^{(i)}(x) \in Q$  since  $P = Q \cap R$ ; thus,  $v = w$  on  $R$ , hence also  $v = w$  on  $K$ , and  $S \subseteq S_w = R_v$ . Furthermore, by 2.1, we have  $Q = \mathfrak{M}_w \cap S$ , hence also  $Q = \mathfrak{M}_v \cap S$ , so that  $\mathfrak{M}_v \cap S$  is the unique prime ideal of  $S$  lying over  $P$ .

**LEMMA 2.3.** *Let  $A$  be a  $D$ -simple valuation ring. Then,  $A$  is a field or is a rank-1 discrete valuation ring.*

*Proof.* If  $A$  is not a field, and  $\mathfrak{A} \neq (1)$  is any ideal of  $A$ , then  $\bigcap_{n=0}^{\infty} \mathfrak{A}^n \neq (1)$  is a  $D$ -ideal; thus,  $A$  being  $D$ -simple, we have  $\bigcap_{n=0}^{\infty} \mathfrak{A}^n = (0)$  and  $A$  is a rank-1 discrete valuation ring.

**THEOREM 2.4.** *Let  $R$  be a  $D$ -simple ring with quotient field  $K$ . Let  $\mathcal{P} = \{\text{proper prime ideals of } R\}$ , and  $\mathcal{V} = \{\text{valuation rings of } K \text{ containing } R \text{ to which } D \text{ can be extended}\}$ . Define  $\varphi: \mathcal{P} \rightarrow \mathcal{V}$  by  $\varphi(P) = R_v$  where  $v$  is the valuation associated to  $P$  by 2.1. Then,  $\varphi$  is a bijection.*

*Proof.* Let us show first that  $D$  is regular on  $R_v$ . Let  $ab^{-1}$  be any element of  $R_v$  with  $a, b \in R$ ,  $b \neq 0$ ,  $v(a) \geq v(b)$ ; then  $D(ab^{-1}) = [bD(a) - aD(b)]b^{-2}$ . If  $v(a) > v(b)$ , then  $v(D(a)) = v(a) - 1 \geq v(b)$  and  $v(D(b)) \geq v(b) - 1$ , so that  $v(bD(a) - aD(b)) \geq \inf\{v(b) + v(D(a)), v(a) + v(D(b))\} \geq 2v(b)$  and  $D(ab^{-1}) \in R_v$ . If  $v(a) = v(b) = 0$ , then  $v(bD(a) - aD(b)) \geq 0 = 2v(b)$  and  $D(ab^{-1}) \in R_v$ . If  $v(a) = v(b) = n > 0$ , then  $v(bD(a)) = v(aD(b)) = 2n - 1$  so that  $v(bD(a) - aD(b)) \geq 2n - 1$ ; furthermore we have  $D^{(2n-1)}(bD(a)) = \sum_{i=0}^{2n-1} C_{2n-1}^i D^{(i)}(b) D^{(2n-i)}(a) = \alpha_1 + C_{2n-1}^n D^{(n)}(b) D^{(n)}(a)$  with  $\alpha_1 \in P$ , and similarly  $D^{(2n-1)}(aD(b)) = \alpha_2 + C_{2n-1}^n D^{(n)}(a) D^{(n)}(b)$  with  $\alpha_2 \in P$ , so that  $D^{(2n-1)}(bD(a) - aD(b)) = \alpha_1 - \alpha_2 \in P$ ; hence  $v(bD(a) -$

$aD(b) \geq 2n$  and  $D(ab^{-1}) \in R_v$ . Thus,  $D$  is regular on  $R_v$ .

If  $\mathfrak{M}_v$  is the maximal ideal of  $R_v$ , we have  $P = \mathfrak{M}_v \cap R$  by 2.1, thus  $\varphi$  is injective.

Now, let  $A$  be a valuation ring of  $K$  containing  $R$  to which  $D$  can be extended. If  $A = K$ , we clearly have  $A = \varphi((0))$ . If  $A \neq K$ , let  $Q$  be its maximal ideal. Let  $P = Q \cap R$ , let  $v$  be the valuation associated to  $P$  by 2.1, and let  $R_v$  be the valuation ring of  $v$ . Since  $P$  is different from  $(0)$ ,  $R_v$  is different from  $K$ ; by 2.2, we have  $A \subseteq R_v$ ; by 1.1  $A$  is  $D$ -simple, and hence has rank-1 by 2.3. Thus  $A = R_v$ ,  $A = \varphi(Q \cap R)$ , and  $\varphi$  is surjective.

**COROLLARY 2.5.** *Let  $R$  be a  $D$ -simple ring with quotient field  $K$ . Let  $A$  be a valuation ring of  $K$  which contains  $R$ ,  $Q$  its maximal ideal,  $P$  its center over  $R$ , and  $v$  the valuation associated to  $P$  by 2.1. Then, the following statements are equivalent:*

- (i)  $D$  can be extended to  $A$ .
- (ii) For any  $a, b \in P$  such that  $v(a) \geq v(b)$ , then  $ab^{-1} \in A$ .
- (iii) For any  $x \in A$ , there exists  $a, b \in R$ , such that  $x = a/b$  and  $v(a) \geq v(b)$ .

*Remember that for an element  $a$  of  $R$ ,  $v(a)$  is the number of successive applications of the derivation  $D$  necessary to get  $a$  out of the center  $P$ .*

*Proof.* The condition (ii) is equivalent to  $R_v \subseteq A$ ; the condition (iii) is equivalent to  $A \subseteq R_v$ . But in both cases  $A$  and  $R_v$  have the same center on  $R$ ; thus, both conditions (ii) and (iii) are equivalent to  $A = R_v$ , i.e., equivalent to (i).

**3. On the inertia field.** Let  $N$  be a normal algebraic extension of  $K$  (possibly infinite), and  $G$  its Galois group. Let  $B$  be a valuation ring of  $N$ ,  $\mathfrak{M}_B$  its maximal ideal; let  $\pi$  be a place of  $N$  corresponding to  $B$  and  $\mu$  its residue field; let  $v$  be a valuation of  $N$  corresponding to  $B$  and  $\mathcal{A}$  its value group. Let  $A = B \cap K$ ,  $\mathcal{A}$  its residue field and  $\Gamma$  its value group;  $\mu$  is a normal algebraic extension of  $\mathcal{A}$  [1, (14.5)]. The inertia group of  $B$  over  $K$  is  $G^T(B|K) = \{\sigma \in G/\sigma x - x \in \mathfrak{M}_B \forall x \in B\} = \{\sigma \in G/\pi \circ \sigma = \pi\}$ ; it is a closed subgroup of  $G$  [1, (19.2)]; its fixed field  $K^T(B|K) = \{y \in N/\sigma y = y \forall \sigma \in G^T(B|K)\}$  is the inertia field of  $B$  over  $K$ .

In this section, we shall only be concerned with the case of  $A = B \cap K$  being a rank-1 discrete valuation ring which contains the rational numbers. Note that  $B$  has to be of rank-1 too [1, (13.14)]. We have:

**PROPOSITION 3.1.**  *$K^r(B|K)$  is the smallest field  $L$  between  $K$  and  $N$  such that  $B \cap L$  is indecomposed in  $N$  and such that  $\mu$  is purely inseparable over the residue field  $A^L$  of  $B \cap L$ .*

*Proof.* See [1, (19.11)].

**PROPOSITION 3.2.**  *$K^r(B|K)$  is the unique field  $L$  between  $K$  and  $N$  such that  $B \cap L$  is indecomposed in  $N$ ,  $f(B|L) = 1$  and  $e(B \cap L|K) = 1$ .*

*Proof.* Since  $A$  contains the rational numbers,  $A$  has characteristic zero,  $\mu$  is a separable extension of  $A$ , and, by 3.1,  $K^r(B|K)$  is the smallest field  $L$  between  $K$  and  $N$  such that  $B \cap L$  is indecomposed in  $N$  and  $f(B|L) = 1$ . Now,  $N$  is also separable over  $K$  so that  $\Gamma^r = \Gamma$ , and  $B \cap K^r(B|K)$  is a rank-1 discrete valuation ring; then  $B \cap K^r(B|K)$  is defectless in all the finite extensions of  $K^r(B|K)$  contained in  $N$  [6, Corollary, p. 287], and  $K^r(B|K)$  is maximal among the fields  $L$  that have the property  $f(B|L) = 1$  and  $e(B \cap L|K) = 1$ .

**PROPOSITION 3.3.**  *$K^r(B|K)$  is the biggest field  $L$  between  $K$  and  $N$  such that  $e(B \cap L|K) = 1$ .*

*Proof.* Let  $L$  be a field between  $K$  and  $N$  such that  $e(B \cap L|K) = 1$ . Let  $L^r(B|L)$  be the inertia field of  $B$  over  $L$ ; by 3.2,  $B \cap L^r(B|L)$  is indecomposed in  $N$ ,  $f(B|L^r(B|L)) = 1$  and  $e(B \cap L^r(B|L)|L) = 1$ , hence also  $e(B \cap L^r(B|L)|K) = 1$  since  $e(B \cap L|K) = 1$ . Thus, by 3.2,  $L^r(B|L) = K^r(B|K)$  and  $L \subseteq K^r(B|K)$ .

**COROLLARY 3.4.** *Let  $V$  be a valuation ring contained in  $N$  lying over  $A$ . Then, the following statements are equivalent:*

- (i)  $e(V|K) = 1$ .
- (ii) *There exists a valuation ring  $E$  of  $N$  lying over  $V$  such that  $V \subseteq K^r(E|K)$ .*
- (iii) *For every valuation ring  $E$  of  $N$  lying over  $V$ ,  $V \subseteq K^r(E|K)$ .*

Now, let  $(N^*, B^*)$  be a completion of  $(N, B)$ ; by this, we mean that  $N^*$  is a  $B$ -completion of  $N$  [5, (1-7-1), p. 27], and  $B^*$  the topological closure of  $B$  in  $N^*$ ; let  $(K^*, A^*)$  be the completion of  $(K, A)$  contained in  $(N^*, B^*)$ .  $A$  being a rank-1 discrete valuation ring, we let  $t$  be a generator of the maximal ideal of  $A$ . Let  $\bar{O}'$  be an algebraic closure of  $N^*$ , and  $\bar{O}$  the algebraic closure of  $K^*$  contained in  $\bar{O}'$ . Let  $C$  be a field of representatives of  $A^*$  and  $\bar{C}$  the algebraic closure of  $C$  contained in  $\bar{O}$ ; by [7, Theorem 27, p. 304], we have  $A^* = C[[t]]$  and  $K^* = C((t))$ . Let  $F$  be the unique valuation ring of  $\bar{O}$  which lies over  $A^*$  [5, (2-1-3), p. 44]. The situation can be resumed by the fol-

lowing diagram:

PROPOSITION 3.5.  $K^r(B/K) = \bar{C}((t)) \cap N$  and  $B \cap K^r(B/K) = \bar{C}[[t]] \cap N$ .

*Proof.* We shall do it in several steps.

*Step 1.*  $\bar{C}((t)) \cap \bar{U}$  is the inertia field of  $F$  over  $K^*$  and  $\bar{C}[[t]] \cap \bar{U} = F \cap (\bar{C}((t)) \cap \bar{U})$ .

*Proof.*  $\bar{C}[[t]] \cap \bar{U}$  is a valuation ring of  $\bar{C}((t)) \cap \bar{U}$  which lies over  $A^* = C[[t]]$ ; thus it is indecomposed in  $\bar{U}$  and is equal to  $F \cap (\bar{C}((t)) \cap \bar{U})$ . Let  $\xi$  (respectively  $w$ -) be a place (respectively a valuation) of  $\bar{U}$  corresponding to the valuation ring  $F$ ; since  $\bar{C} \subseteq \bar{U}$ , we have  $\xi(C) = \xi(C[[t]]) \subseteq \xi(\bar{C}) \subseteq \xi(\bar{C}[[t]] \cap \bar{U}) \subseteq \xi(F)$ ; furthermore  $\xi(F)$  is algebraic over  $\xi(C[[t]])$  by [1, (14.5)], and  $\xi(\bar{C}) \cong \bar{C}$  is algebraically closed; thus  $\xi(\bar{C}[[t]] \cap \bar{U}) = \xi(F)$ . On the other hand we have clearly  $w(C[[t]]) = w(\bar{C}[[t]] \cap \bar{U})$ . Thus by 3.2,  $\bar{C}((t)) \cap \bar{U}$  is the inertia field of  $F$  over  $K^*$ .

*Step 2.* Let  $N_\alpha$  be a finite normal extension of  $K$  contained in  $N$ . Let  $N_\alpha^*$  be the completion of  $N_\alpha$  contained in  $N^*$ . Then  $\bar{C}((t)) \cap N_\alpha^*$  is the inertia field of  $B^* \cap N_\alpha^*$  over  $K^*$  and  $\bar{C}[[t]] \cap N_\alpha^* = (B^* \cap N_\alpha^*) \cap (\bar{C}((t)) \cap N_\alpha^*)$ .

*Proof.*  $N_\alpha^*$  is a finite normal extension of  $K^*$  [4, Corollary 4, p. 41]; hence  $N_\alpha^* \subseteq \bar{U}$ .  $B^* \cap N_\alpha^*$  is a valuation ring of  $N_\alpha^*$  which lies over  $A^*$ ; hence it has to be equal to  $F \cap N_\alpha^*$ . Now, the inertia field of  $F \cap N_\alpha^*$  over  $K^*$  is equal to the intersection of the inertia field of  $F$  over  $K^*$  with  $N_\alpha^*$  [1, (19.10)], i.e., is equal to  $(\bar{C}((t)) \cap \bar{U}) \cap N_\alpha^* =$

$\bar{C}((t)) \cap N_\alpha^*$ . Finally,  $\bar{C}[[t]] \cap N_\alpha^*$  is a valuation ring of  $\bar{C}((t)) \cap N_\alpha^*$  which lies over  $A^*$ , thus it has to lie under  $B^* \cap N_\alpha^*$ , i.e., we need to have  $\bar{C}[[t]] \cap N_\alpha^* = (B^* \cap N_\alpha^*) \cap \bar{C}((t)) \cap N_\alpha^*$ .

*Step 3.*  $\bar{C}((t)) \cap N_\alpha$  is the inertia field of  $B \cap N_\alpha$  over  $K$  and  $\bar{C}[[t]] \cap N_\alpha = (B \cap N_\alpha) \cap (\bar{C}((t)) \cap N_\alpha)$ .

*Proof.*  $B \cap N_\alpha \cap \bar{C}((t)) \subseteq B^* \cap N_\alpha^* \cap \bar{C}((t)) = \bar{C}[[t]] \cap N_\alpha^*$  by Step 2; then, being contained in  $\bar{C}((t)) \cap N_\alpha$ ,  $B \cap N_\alpha \cap \bar{C}((t))$  has also to be contained in  $\bar{C}[[t]] \cap N_\alpha$ ; being a rank-1 valuation ring,  $B \cap N_\alpha \cap \bar{C}((t))$  has to be equal to  $\bar{C}[[t]] \cap N_\alpha$ .

Now, if we still call  $w$  the valuation of  $\bar{U}$  corresponding to  $F$ , we have  $w(K) \subseteq w(\bar{C}((t)) \cap N_\alpha) \subseteq w(\bar{C}((t)) \cap N_\alpha^*)$ ; but  $w(K^*) = w(\bar{C}((t)) \cap N_\alpha^*)$  by Step 2, and  $w(K) = w(K^*)$  because, by [5, (1-7-5), p. 31], the completion is an immediate extension; hence  $w(K) = w(\bar{C}((t)) \cap N_\alpha)$ , and  $\bar{C}((t)) \cap N_\alpha \subseteq K^T(B \cap N_\alpha/K)$  by 3.3. Then,  $\bar{C}((t)) \cap N_\alpha = K^T(B \cap N_\alpha/K)$ , because if not, the completion  $L$  of  $K^T(B \cap N_\alpha/K)$  contained in  $N_\alpha^*$  would be such that  $L \not\subseteq \bar{C}((t)) \cap N_\alpha^*$  and  $e(B^* \cap L/K^*) = 1$ , which is impossible by 3.3, since  $\bar{C}((t)) \cap N_\alpha^*$  is the inertia field of  $B^* \cap N_\alpha^*$  over  $K^*$  by Step 2.

*Step 4.*  $\bar{C}((t)) \cap N$  is the inertia field of  $B$  over  $K$  and  $\bar{C}[[t]] \cap N = B \cap (\bar{C}((t)) \cap N)$ .

*Proof.* Let  $\{N_\alpha; \alpha \in J\}$  be the set of all the finite normal subextensions of  $N$  over  $K$ . Let us show that  $K^T(B|K) = \bigcup_{\alpha \in J} K^T(B \cap N_\alpha|K)$ . For any  $\alpha \in J$ , the homomorphism  $\theta_\alpha^T: G^T(B|K) \rightarrow G^T(B \cap N_\alpha|K)$  defined by  $\theta_\alpha^T(\rho) = \rho|_{N_\alpha}$  is the restriction of  $\rho$  to  $N_\alpha$ , is surjective [1, (19.7)]. Let  $x \in K^T(B|K)$ ,  $N_\alpha$  a finite normal extension of  $K$  containing  $x$  and  $\sigma \in G^T(B \cap N_\alpha|K)$ ; since  $\theta_\alpha^T$  is surjective, there exists  $\rho \in G^T(B|K)$  such that  $\rho|_{N_\alpha} = \sigma$ , so that  $\sigma(x) = \rho(x) = x$  and  $x \in K^T(B \cap N_\alpha|K)$ . Conversely, let  $\alpha \in J$ , and  $x \in K^T(B \cap N_\alpha|K)$ ; for any  $\rho \in G^T(B|K)$  we have  $\rho|_{N_\alpha} \in G^T(B \cap N_\alpha|K)$ , so that  $\rho(x) = \rho|_{N_\alpha}(x) = x$  and  $x \in K^T(B|K)$ . Hence,  $K^T(B|K) = \bigcup_{\alpha \in J} K^T(B \cap N_\alpha|K) = \bigcup_{\alpha \in J} (\bar{C}((t)) \cap N_\alpha) = \bar{C}((t)) \cap (\bigcup_{\alpha \in J} N_\alpha) = \bar{C}((t)) \cap N$ , and  $B \cap K^T(B|K) = B \cap (\bigcup_{\alpha \in J} K^T(B \cap N_\alpha|K)) = \bigcup_{\alpha \in J} (B \cap K^T(B \cap N_\alpha|K)) = \bigcup_{\alpha \in J} (\bar{C}[[t]] \cap N_\alpha) = \bar{C}[[t]] \cap N$ .

4. Extensions of the derivation in the algebraic closure of the quotient field.

**LEMMA 4.1.** *Let  $A$  be a ring,  $I$  a finitely generated ideal of  $A$  such that  $\bigcap_{n=0}^\infty I^n = (0)$ ,  $A^*$  the  $I$ -adic completion of  $A$ . Let  $D: A \rightarrow A^*$  be a map such that  $D(x+y) = D(x) + D(y)$  and  $D(xy) = xD(y) + yD(x)$ . Then,*

(i)  $D$  can be extended to a derivation  $D'$  on  $A^*$  by  $D'(\lim_n x_n) = \lim_n D(x_n)$ , where  $\{x_n\}_{n \geq 0}$  is a Cauchy sequence in  $A$ .

(ii)  $D'$  is the only derivation of  $A^*$  that extends  $D$ .

*Proof.* (i) Let  $\{x_n\}_{n \geq 0}$  be a Cauchy sequence in  $A$ ; for any positive integer  $m$ , there exists  $q$  such that  $r, s > q \Rightarrow x_r - x_s \in I^m$ ;  $x_r - x_s \in I^m \Rightarrow x_r - x_s = \sum_i u_{i1} \cdots u_{im}$  with  $u_{ij} \in I$ , hence  $Dx_r - Dx_s = D(x_r - x_s) = \sum_i \sum_{j=1}^m u_{ij} \cdots u_{i(j-1)} D(u_{i1}) u_{i(j+1)} \cdots u_{im} \in (IA^*)^{m-1}$ ; then as  $I$  is finitely generated, the topology of  $A^*$  is the  $(IA^*)$ -adic topology [7, Corollary 1, p. 257], and  $\{Dx_n\}_{n \geq 0}$  is a Cauchy sequence in  $A^*$ ; set  $D'(\lim_n x_n) = \lim_n D(x_n)$ . Defined that way,  $D'$  is a function of  $A^*$  for if  $\{z_n\}_{n \geq 0}$  is another Cauchy sequence such that  $\lim_n x_n = \lim_n z_n$ , then for any positive integer  $m$ , there exists  $q$  such that  $n > q \Rightarrow (x_n - z_n) \in I^m$ , so that  $D(x_n) - D(z_n) = D(x_n - z_n) \in (IA^*)^{m-1}$ , and  $\lim_n D(x_n) = \lim_n D(z_n)$ . Furthermore,  $D'$  is a derivation of  $A^*$  for if  $\{x_n\}_{n \geq 0}$  and  $\{z_n\}_{n \geq 0}$  are two Cauchy sequences of  $A$ , then  $\lim_n D(x_n + z_n) = \lim_n D(x_n) + \lim_n D(z_n)$  and  $\lim_n D(x_n \cdot z_n) = \lim_n x_n \cdot \lim_n D(z_n) + \lim_n D(x_n) \cdot \lim_n z_n$  since, for every  $n$ , we have  $D(x_n + z_n) = D(x_n) + D(z_n)$  and  $D(x_n \cdot z_n) = x_n \cdot D(z_n) + D(x_n) \cdot z_n$ . Finally, for any  $y \in A$ , we clearly have  $D'(y) = D(y)$ .

(ii) Let  $D''$  be a derivation of  $A^*$  which extends  $D$ . Let  $y$  be any element of  $A^*$ , and  $\{x_n\}_{n \geq 0}$  a Cauchy sequence in  $A$  such that  $y = \lim_n x_n$ ; then, for any positive integer  $m$ , there exists  $q$  such that  $n > q \Rightarrow y - y_n \in (IA^*)^m$ , so that  $D''(y) - D(y_n) = D''(y) - D''(y_n) = D''(y - y_n) \in (IA^*)^{m-1}$ , and  $D''(y) = \lim_n D(y_n) = D'(y)$ .

REMARK. In the case of  $D$  being a derivation of  $A$ , the procedure used in the preceding lemma allows to extend  $D$  to a derivation  $D'$  of  $A^*$  even if  $I$  is not finitely generated. To get the uniqueness property however, we again need  $I$  to be finitely generated.

THEOREM 4.2. Let  $A$  be a rank-1 discrete valuation ring containing the rational numbers with quotient field  $K$ ; let  $\Omega$  be an algebraic closure of  $K$  and  $D$  a derivation of  $A$ . Let  $B$  be a valuation ring of  $\Omega$  lying over  $A$ ; let  $V$  be a valuation ring contained in  $\Omega$ , lying over  $A$  and unramified over  $K$ . Then,

(i)  $(K^T(B|K), B \cap K^T(B|K))$  is a  $D$ -regular extension of  $(K, A)$  contained in  $(\Omega, B)$ .

(ii)  $(N, B \cap N)$  is  $D$ -regular for any field  $N$  between  $K$  and  $K^T(B|K)$ .

(iii)  $D$  is regular on  $V$ .

*Proof.* (i) Let  $(\Omega^*, B^*)$  be a completion of  $(\Omega, B)$  and  $(K^*, A^*)$

the completion of  $(K, A)$  contained in  $(\Omega^*, B^*)$ ; let  $\bar{O}'$  be an algebraic closure of  $\Omega^*$  and  $\bar{O}$  the algebraic closure of  $K^*$  contained in  $\bar{O}'$ . Let  $t$  be a generator of the maximal ideal of  $A$ ; let  $C$  be a field of representatives of  $A^*$ , and  $\bar{C}$  the algebraic closure of  $C$  in  $\bar{O}$ ; of course we have  $A^* = C[[t]]$  and  $K^* = C((t))$  [7, Corollary, p. 307]. By 4.1, let  $D'$  be the unique derivation of  $A^*$  which is an extension of  $D$ , and, as usual, call again  $D'$  its extension to  $\bar{O}$ . For an element  $y$  of  $\bar{C}$ , we have  $D'(y) \in \bar{C}[[t]]$ ; indeed, if  $X^n + c_1X^{n-1} + \dots + c_n \in C[X]$  is the minimal polynomial of  $y$  over  $C$ , differentiating the equation  $y^n + c_1y^{n-1} + \dots + c_n = 0$ , we get  $(ny^{n-1} + c_1(n-1)y^{n-2} + \dots + c_{n-1})D'(y) + (D(c_1)y^{n-1} + \dots + D(c_n)) = 0$ ; the first factor of the first term is an element of  $\bar{C}$ , different from zero since  $y$  is separable over  $C$ ; the second term is an element of  $\bar{C}[[t]]$ ; thus  $D'(y) \in \bar{C}[[t]]$ . We also have  $D'(t) \in \bar{C}[[t]]$ , so that the restriction  $D''$  of  $D'$  to  $\bar{C}[t]$  is a function with values in  $\bar{C}[[t]]$  which satisfies the properties  $D''(x+z) = D''(x) + D''(z)$  and  $D''(xz) = xD''(z) + zD''(x)$ ; furthermore,  $\bar{C}[[t]]$  is the  $(t)$ -adic completion of  $\bar{C}[t]$ ; thus, by 4.1,  $D''$  can be extended to a derivation of  $\bar{C}[[t]]$ , which we call  $D''$  again, by  $D''(\sum_{i=0}^{\infty} d_i t^i) = \sum_{i=0}^{\infty} D''(d_i t^i) = \sum_{i=0}^{\infty} D'(d_i t^i)$ . As  $C[[t]]$  is the completion of  $C[t]$  for the  $(t)$ -adic topology, by 4.1 also, we know that for an element  $\sum_{i=0}^{\infty} c_i t^i$  of  $C[[t]]$  we must have  $D'(\sum_{i=0}^{\infty} c_i t^i) = \sum_{i=0}^{\infty} D'(c_i t^i)$ , so that  $D' = D''$  on  $A^* = C[[t]]$ ; thus  $D = D''$  on  $A$ , hence also on  $K$ . But we can even see that  $D = D''$  on  $\bar{C}((t)) \cap \Omega$ ; indeed, if  $X^m + k_1X^{m-1} + \dots + k_m \in K[X]$  is the minimal polynomial over  $K$  of an element  $z$  of  $\bar{C}((t)) \cap \Omega$ , we have  $z^m + k_1z^{m-1} + \dots + k_m = 0$ , thus  $D(z) = [D(k_1)z^{m-1} + \dots + D(k_m)] \times [mz^{m-1} + \dots + k_{m-1}]^{-1} = [D''(k_1)z^{m-1} + \dots + D''(k_m)][mz^{m-1} + \dots + k_{m-1}]^{-1} = D''(z)$ . Then, since  $D$  is regular on  $\Omega$ , since  $D''$  is regular on  $\bar{C}[[t]]$ , and since  $D = D''$  on  $\bar{C}((t)) \cap \Omega$ , we get that  $(\bar{C}((t)) \cap \Omega, \bar{C}[[t]] \cap \Omega)$  is  $D$ -regular; but by 3.5 we know that  $\bar{C}((t)) \cap \Omega = K^r(B|K)$  and  $\bar{C}[[t]] \cap \Omega = B \cap K^r(B|K)$ ; thus  $(K^r(B|K), B \cap K^r(B|K))$  is  $D$ -regular.

(ii) Let  $N$  be any field between  $K$  and  $K^r(B|K)$ .  $D$  is regular on  $N$  and is regular on  $B \cap K^r(B|K)$ ; thus  $D$  is regular on  $(B \cap K^r(B|K)) \cap N = B \cap N$ .

(iii) Let  $B'$  be a valuation ring of  $\Omega$  lying over  $V$ ; by 3.4 we have  $V \subseteq K^r(B'|K)$ , so that  $D$  is regular on  $V$ .

**THEOREM 4.3.** *Let  $A$  be a  $D$ -simple valuation ring with quotient field  $K$ ; let  $\Omega$  be an algebraic closure of  $K$ , and  $B$  a valuation ring of  $\Omega$  lying over  $A$ . Then,  $(K^r(B|K), B \cap K^r(B|K))$  is the biggest  $D$ -regular extension of  $(K, A)$  contained in  $(\Omega, B)$ .*

*Proof.* Being  $D$ -simple,  $A$  contains the rational numbers; thus, by 4.2, we know that  $(K^r(B|K), B \cap K^r(B|K))$  is  $D$ -regular. Now let  $(L, E)$  be a  $D$ -regular extension of  $(K, A)$  contained in  $(\Omega, B)$ ; of

course  $E$  is rank-1, and thus  $B$  lies over  $E$ ; also  $E$  is  $D$ -simple by 1.1. If  $t$  is a generator of the maximal ideal of  $A$ , then  $t$  is also a generator of the maximal ideal  $\mathfrak{M}_E$  of  $E$ ; indeed, otherwise we would have  $t \in \mathfrak{M}_E^2$ , hence also  $D(t) \in \mathfrak{M}_E$  which cannot be since  $D(t)$  is a unit in  $A$ . Thus, the index of ramification of  $E$  over  $K$  is equal to 1, and by 3.3  $(L, E) \subseteq (K^r(B|K), B \cap K^r(B|K))$ .

**COROLLARY 4.4.** *Let  $R$  be a  $D$ -simple ring with quotient field  $K$ ; let  $\Omega$  be an algebraic closure of  $K$ . Let  $V$  be a valuation ring which contains  $R$  and is contained in  $\Omega$ ; let  $e(V|K)$  be its ramification index over  $K$ . Then, the following statements are equivalent:*

- (i)  $D$  is regular on  $V$ .
- (ii)  $e(V|K) = 1$  and  $D$  is regular on  $V \cap K$ .

*Proof.* If  $D$  is regular on  $V$ , then  $D$  is regular on  $V \cap K$  since  $D$  is also regular on  $K$ . Furthermore,  $V \cap K$  contains  $R$  which is  $D$ -simple; thus, by 1.1,  $V \cap K$  is  $D$ -simple and, as already noticed in the proof of 4.3, this implies that  $e(V|K) = 1$ . Conversely, if  $D$  is regular on  $V \cap K$  and if  $e(V|K) = 1$  we know that  $D$  is regular on  $V$  by 4.2.
