BOUNDS FOR PRODUCTS OF INTERVAL FUNCTIONS

JON CRAIG HELTON

BOUNDS FOR PRODUCTS OF INTERVAL FUNCTIONS

JON C. HELTON

Since it is possible for ${}_a\Pi^b(1 + G)$ to exist and not be zero when G is unbounded and $1 + G$ is not bounded away from zero, the conditions under which products of the form $|\Pi_1^n[1 + G(x_{q-1}, x_q)]|$ are bounded or bounded away from zero for suitable subdivisions $\{x_q\}_0^n$ of $[a, b]$ are important in many theorems concerning product integrals. Conditions are obtained for such bounds to exist for products of the form $\Pi(1 + FG)$ and $\Pi(1 + F + G)$, where F and G are functions from $R \times R$ to R . Further, these results are used to obtain an existence theorem for product integrals.

All integrals and definitions are of the subdivision-refinement type, and functions are from the subset $\{(x, y): x < y\}$ of $R \times R$ to R , where R represents the set of real numbers. If $D = \{x_q\}_0^n$ is a subdivision of $[a, b]$ and G is a function, then $D(I) = \{\{x_{q-1}, x_q\}\}_1^n$ and $G_q = G(x_{q-1}, x_q)$. The statements that G is bounded, $G \in OP^\circ$, $G \in OQ^\circ$ and $G \in OB^\circ$ on $[a, b]$ mean there exist a subdivision D of $[a, b]$ and a positive number B such that if $J = \{x_q\}_0^n$ is a refinement of D , then

- (1) $|G(u)| < B$ for $u \in J(I)$,
- (2) $|\Pi_r^s(1 + G_q)| < B$ for $1 \leq r \leq s \leq n$,
- (3) $|\Pi_r^s(1 + G_q)| > B$ for $1 \leq r \leq s \leq n$, and
- (4) $\sum_{J(I)} |G| < B$,

respectively. The notation $\{x_{qr}\}_0^{n(q)}$ represents a subdivision of an interval $[x_{q-1}, x_q]$ defined by a subdivision $\{x_q\}_0^n$. If G is a function, then $G \in S_1$ on $[a, b]$ only if $\lim_{x, y \rightarrow p} + G(x, y)$ and $\lim_{x, y \rightarrow p} - G(x, y)$ exist and are zero for $p \in [a, b]$, and $G \in S_2$ on $[a, b]$ only if $\lim_{x \rightarrow p} + G(p, x)$ and $\lim_{x \rightarrow p} - G(x, p)$ exist for $p \in [a, b]$. Further, $G \in OA^\circ$ on $[a, b]$ only if $\int_a^b G$ exists and $\int_a^b |G| - \int_a^b G = 0$, and $G \in OM^\circ$ on $[a, b]$ only if ${}_a\Pi^b(1 + G)$ exists for $a \leq x < y \leq b$ and $\int_a^b |1 + G - \Pi(1 + G)| = 0$. Also, $G \in OQ^1$ and $G \in OB^*$ on $[a, b]$ if there exists a subdivision $D = \{x_q\}_0^n$ of $[a, b]$ such that

- (1) if $1 \leq q \leq n$ and $x_{q-1} < x < y < x_q$, then $G \in OQ^\circ$ on $[x, y]$, and
- (2) if $1 \leq q \leq n$, then either $G \in OB^\circ$ on $[x_{q-1}, x_q]$ or $G - 1 \in OB^\circ$ on $[x_{q-1}, x_q]$,

respectively. The statement that G is almost bounded above by β (or, almost bounded below by β) on $[a, b]$ means there exists a positive integer N such that if D is a subdivision of $[a, b]$ and $u \in H$ only if $u \in D(I)$ and $G(u) > \beta$ (or, $G(u) < \beta$) then H has less than N elements. Consult B. W. Helton [2] and J. S. MacNerney [4] for

additional details.

THEOREM 1. *If G is a function, then the following are equivalent:*

- (1) $G \in OB^\circ$ on $[a, b]$, and
- (2) if $F \in OP^\circ$ on $[a, b]$, then $F + G \in OP^\circ$ on $[a, b]$.

Proof (2 \rightarrow 1). Let F be the function such that $F(x, y) = 0$ if $G(x, y) \geq 0$ and $F(x, y) = -2$ if $G(x, y) < 0$. Hence, if J is a subdivision of $[a, b]$, then

$$|\Pi_{J(I)}(1 + F + G)| = \Pi_{J(I)}(1 + |G|),$$

which can be bounded only if $G \in OB^\circ$.

Proof (1 \rightarrow 2). Suppose $F \in OP^\circ$. There exist positive numbers B and C with $B > 1$, a positive integer i and a subdivision D of $[a, b]$ such that if $J = \{x_q\}_0^w$ is a refinement of D , then

$$(1) |\Pi_r^s(1 + F_q)| < B \text{ for } 1 \leq r \leq s \leq w,$$

$$(2) \exp[4B \Sigma_{J(I)} |G|] < C,$$

(3) if T is a collection of nonintersecting subsets of $J(I)$, then the number of $t \in T$ such that $\exp[4B \Sigma_t |G|] > 2$ is less than i , and

$$(4) \text{ the number of } u \in J(I) \text{ such that } |G(u)| > 1/4B \text{ is less than } i.$$

Let $J = \{x_q\}_0^w$ be a refinement of D and suppose $1 \leq r \leq s \leq w$. Let $L = \{[x_{q-1}, x_q]\}_r^s$, and let H be the subset of L such that $u \in H$ only if $|1 + F(u)| \leq 1/4B$. Further, let K be the collection of subsets of L such that $k \in K$ only if there exist $u, v \in H$ such that u precedes v on $[a, b]$ and either

$$(1) k = \{t | t \text{ precedes } v \text{ and follows } u\} \text{ and } k \cap H = \emptyset,$$

$$(2) u \text{ is the first element in } H \text{ and } k = \{t | t \text{ precedes } u\}, \text{ or}$$

$$(3) v \text{ is the last element in } H \text{ and } k = \{t | t \text{ follows } v\}.$$

Let $u \in M$ only if $u \in H$ and $|G(u)| > 1/4B$, and let $k \in N$ only if $k \in K$ and $\exp[4B \Sigma_k |G|] > 2$. Hence, M and N each has less than i elements. Also, K has at most one more element than H . Hence, $K - N$ can have at most i more elements than $H - M$. Let j, m and n denote the number of elements in $M, H - M$ and $K - N$, respectively, and suppose $U = \bigcup_{k \in K} k$. Hence,

$$\begin{aligned} & |\Pi_L(1 + F + G)| \\ & \leq \{\Pi_H[1 + F] + |G|\} \cdot \{\Pi_U(1 + F + G)\} \\ & \leq \{\Pi_M[1/4B + |G|]\} \cdot \{\Pi_{H-M}[1/4B + |G|]\} \cdot \{\Pi_U(1 + F + G)\} \\ & \leq \{(1/4B)^j C\} \cdot \{1/4B + 1/4B\}^m \cdot \{\Pi_U(1 + F + G)\} \\ & \leq C\{1/2B\}^m \cdot \{\Pi_{k \in K} |\Pi_k[1 + F][1 + (1 + F)^{-1}G]|\} \\ & \leq C\{1/2B\}^m \cdot \{\Pi_{k \in K} [|\Pi_k(1 + F)|][|\Pi_k(1 + 4B|G|)]\} \\ & = C\{1/2B\}^m \cdot \{\Pi_{k \in N} [|\Pi_k(1 + F)|][|\Pi_k(1 + 4B|G|)]\}. \end{aligned}$$

$$\begin{aligned} & \{II_{k \in K-N}[|II_k(1 + F)|][II_k(1 + 4B|G|)]\} \\ & \leq C\{1/2B\}^m \cdot \{BC\}^i \cdot \{2B\}^n \\ & = B^i C^{i+1} (2B)^{n-m} \leq B^i C^{i+1} (2B)^i . \end{aligned}$$

LEMMA 1.1. *If $\int_a^b F$ exists, then $F \in OA^\circ$ on $[a, b]$.*

This result is due to A. Kolmogoroff [3, p. 669]. Further, related results have also been obtained by W. D. L. Appling [1, Th. 2, p. 155] and B. W. Helton [2, Th. 4.1, p. 304].

COROLLARY 1.1. *If $\int_a^b F$ exists, then the following are equivalent:*
 (1) $F \in OP^\circ$ on $[a, b]$, and (2) $\int_a^b F \in OP^\circ$ on $[a, b]$.

Indication of proof. Since $\int_a^b F$ exists, $F \in OA^\circ$ [Lemma 1.1]. The result now follows by using Theorem 1.

COROLLARY 1.2. *If $F \in OP^\circ$ on $[a, b]$, ${}_aII^b(1 + F)$ exists and $\int_a^b |G| = 0$, then ${}_aII^b(1 + F + G)$ exists and is ${}_aII^b(1 + F)$.*

Indication of proof. A related result is proved by B. W. Helton [2, Th. 5.6, p. 315]. This result follows by an argument similar to the one used in that theorem since Theorem 1 implies that $F + G \in OP^\circ$.

COROLLARY 1.3. *If G is a function, then the following are equivalent:*

- (1) $G \in OP^\circ$ on $[a, b]$, and
- (2) if $F \in OB^\circ$ on $[a, b]$, then $F + G \in OP^\circ$ on $[a, b]$.

Proof. Theorem 1 establishes that (1) implies (2). Further, (2) implies (1) since $F \equiv 0$ belongs to OB° .

B. W. Helton has shown if G is a function from $S \times S$ to N such that $G \in OA^\circ$ and $G \in OB^\circ$, then $G \in OM^\circ$, where S represents a linearly ordered set and N represents a ring which has a multiplicative identity element denoted by 1 and has a norm $|\cdot|$ with respect to which N is complete and $|1| = 1$ [2, Th. 3.4 (1 \rightarrow 2), p. 301]. We now use Theorem 1 to establish a related result. In particular, we show that if F and G are functions from $R \times R$ to R such that $F \in OM^\circ$, $F \in OP^\circ$, $F \in S_1 \cap S_2$ and $G \in OB^\circ$ on $[a, b]$ and $\int_a^b G$ exists, then $F + G \in OM^\circ$ on $[a, b]$.

LEMMA 2.1. *If F and G are functions such that $F \in OM^\circ$, $F \in$*

OP° , $F \in S_1$ and $G \in OB^\circ$ on $[a, b]$ and $\varepsilon > 0$, then there exists a subdivision $\{y_q\}_0^u$ of $[a, b]$ such that if $y_{q-1} < x < y < y_q$ and H is a subdivision of $[x, y]$, then

$$|1 - \Pi_{H(I)}(1 + F + G)| < \varepsilon.$$

Further, if $F \in S_2$ and $G \in S_2$ on $[a, b]$, then there exists a subdivision $\{z_q\}_0^u$ of $[a, b]$ such that if $z_{q-1} \leq x < y \leq z_q$ and H is a subdivision of $[x, y]$, then

$$|1 + F(x, y) + G(x, y) - \Pi_{H(I)}(1 + F + G)| < \varepsilon.$$

Proof. Suppose F and G are functions such that $F \in OM^\circ$, $F \in OP^\circ$, $F \in S_1$ and $G \in OB^\circ$ on $[a, b]$ and $\varepsilon > 0$. It follows from Theorem 1 that $F + G \in OP^\circ$. There exist a subdivision $D_1 = \{y_q\}_0^u$ of $[a, b]$ and a number $B > 1$ such that if $J = \{x_j\}_0^n$ is a refinement of D_1 , then

$$(1) \quad |\Pi_i^j(1 + F_q)| < B \text{ and } |\Pi_i^j(1 + F_q + G_q)| < B \text{ for } 1 \leq i \leq j \leq n,$$

(2) $|F(x, y)| < \varepsilon/9B$ and $\Sigma_{H(I)}|G| < \varepsilon/9B^3$ if $1 \leq q \leq n$, $x_{q-1} < x < y < x_q$ and H is a subdivision of $[x, y]$, and

(3) $\Sigma_q|(1 + F_q) - \Pi_{H_q(I)}(1 + F)| < \varepsilon/9B$, where H_q is a subdivision of $[x_{q-1}, x_q]$ for $q = 1, 2, \dots, n$.

Suppose $1 \leq q \leq u$ and $y_{q-1} < x < y < y_q$. If $H = \{h_q\}_0^r$ is a subdivision of $[x, y]$, then

$$\begin{aligned} & |1 - \Pi_{H(I)}(1 + F + G)| \\ &= |1 + F(x, y) - F(x, y) - \{\Pi_{q=1}^r(1 + F_q) \\ &\quad + \Sigma_{q=1}^r[\Pi_{j=1}^{q-1}(1 + F_j)][G_q][\Pi_{k=q+1}^r(1 + F_k + G_k)]\}| \\ &\leq |1 + F(x, y) - \Pi_{q=1}^r(1 + F_q)| + |F(x, y)| \\ &\quad + \Sigma_{q=1}^r|\Pi_{j=1}^{q-1}(1 + F_j)||G_q||\Pi_{k=q+1}^r(1 + F_k + G_k)| \\ &< \varepsilon/9B + \varepsilon/9B + B^2\varepsilon/9B^3 = \varepsilon/3B < \varepsilon. \end{aligned}$$

We now make the additional suppositions that $F \in S_2$ and $G \in S_2$ on $[a, b]$. There exists a subdivision $E = \{w_q\}_0^{2u+1}$ of $[a, b]$ such that

$$(1) \quad y_q \in (w_{2q}, w_{2q+1}) \text{ for } 1 \leq q < u,$$

(2) $|F(y_q, w_{2q+1}) + G(y_q, w_{2q+1}) - F(y_q, x) - G(y_q, x)| < \varepsilon/2$ for $0 \leq q < u$ and $x \in (y_q, w_{2q+1}]$, and

(3) $|F(w_{2q}, y_q) + G(w_{2q}, y_q) - F(x, y_q) - G(x, y_q)| < \varepsilon/2$ for $0 < q \leq u$ and $x \in [w_{2q}, y_q)$.

Let $D_2 = \{z_q\}_0^{3u}$ be the subdivision $D_1 \cup E$ of $[a, b]$. Suppose $1 \leq q \leq 3u$, $z_{q-1} \leq x < y \leq z_q$ and H is a subdivision of $[x, y]$. If either $z_{q-1} < x < y < z_q$ or neither z_{q-1} nor z_q is in D_1 , then

$$\begin{aligned} & |1 + F(x, y) + G(x, y) - \Pi_{H(I)}(1 + F + G)| \\ &\leq |F(x, y)| + |G(x, y)| + |1 - \Pi_{H(I)}(1 + F + G)| \\ &< \varepsilon/9B + \varepsilon/9B^3 + \varepsilon/3B < \varepsilon. \end{aligned}$$

If $z_{q-1} \in D_1$, $x = z_{q-1}$ and $H = \{h_q\}_0^r$, then

$$\begin{aligned} & |1 + F(x, y) + G(x, y) - \Pi_{H(L)}(1 + F + G)| \\ & \leq |F(x, y) + G(x, y) - F(x, h_1) - G(x, h_1)| \\ & \quad + |1 + F(x, h_1) + G(x, h_1)| |1 - \Pi_2^r[1 + F(h_{q-1}, h_q) \\ & \quad + G(h_{q-1}, h_q)]| \\ & < \varepsilon/2 + B\varepsilon/3B < \varepsilon. \end{aligned}$$

If $z_q \in D_1$ and $y = z_q$, the necessary inequality follows in a similar manner. Therefore, D_2 is the desired subdivision.

THEOREM 2. *If F and G are functions such that $F \in OM^\circ$, $F \in OP^\circ$, $F \in S_1 \cap S_2$ and $G \in OB^\circ$ on $[a, b]$ and $\int_a^b G$ exists, then $F + G \in OM^\circ$ on $[a, b]$.*

Proof. We initially show that if $\varepsilon > 0$ then there exists a subdivision D of $[a, b]$ such that if $H = \{x_q\}_0^n$ is a refinement of D and H_q is a subdivision of $[x_{q-1}, x_q]$ for $q = 1, 2, \dots, n$, then

$$\Sigma_1^n |1 + F_q + G_q - \Pi_{H_q(L)}(1 + F + G)| < \varepsilon.$$

Let $\varepsilon > 0$. It follows from Lemma 1.1 that $G \in OA^\circ$ and from Theorem 1 that $F + G \in OP^\circ$. Thus, by employing the hypothesis and Lemma 2.1, there exist a subdivision $D_1 = \{y_q\}_0^n$ of $[a, b]$ and a number $B > 1$ such that if $J = \{x_q\}_0^n$ is a refinement of D_1 , then

- (1) $\Sigma_{J(L)} |G| < B$,
- (2) $|\Pi_i^j(1 + F_q)| < B$ for $1 \leq i \leq j \leq n$,
- (3) $\Sigma_1^n |G_q - \Sigma_{L_q(L)} G| < \varepsilon/5$ and $\Sigma_1^n |(1 + F_q) - \Pi_{L_q(L)}(1 + F)| < \varepsilon/5$,

where L_q is a subdivision of $[x_{q-1}, x_q]$ for $1 \leq q \leq n$, and

- (4) $|1 - \Pi_{H(L)}(1 + F)| < \varepsilon/5B$ and $|1 - \Pi_{H(L)}(1 + F + G)| < \varepsilon/5B^2$

for $1 \leq q \leq n$, $x_{q-1} < x < y < x_q$ and H a subdivision of $[x, y]$.

Further, it also follows from Lemma 2.1 that there exists a subdivision $D_2 = \{z_q\}_0^n$ of $[a, b]$ such that if $1 \leq q \leq v$, $z_{q-1} \leq x < y \leq z_q$ and H is a subdivision of $[x, y]$, then

$$|1 + F(x, y) + G(x, y) - \Pi_{H(L)}(1 + F + G)| < \varepsilon/10u.$$

Let $D = D_1 \cup D_2$, and suppose $H = \{x_q\}_0^n$ is a refinement of D and $H_q = \{x_{qr}\}_0^{n(q)}$ is a subdivision of $[x_{q-1}, x_q]$ for $1 \leq q \leq n$. Let P be the set such that $q \in P$ only if $[x_{q-1}, x_q]$ has an end point in D_1 , and let $Q = \{i\}_1^n - P$. Further, to simplify notation, let $F_{qr} = F(x_{q,r-1}, x_{qr})$, $G_{qr} = G(x_{q,r-1}, x_{qr})$, $A_{qr} = \Pi_{j=1}^{r-1}(1 + F_{qj})$ and $B_{qr} = \Pi_{k=r+1}^{n(q)}(1 + F_{qk} + G_{qk})$. Thus,

$$\begin{aligned} & \Sigma_{q=1}^n |1 + F_q + G_q - \Pi_{H_q(L)}(1 + F + G)| \\ & \leq \Sigma_{q \in P} |1 + F_q + G_q - B_{q0}| \end{aligned}$$

$$\begin{aligned}
 & + \sum_{q \in Q} |1 + F_q + G_q - B_{q0}| \\
 < 2u\varepsilon/10u + \sum_{q \in Q} |1 + F_q + G_q - [A_{q,n(q)+1} \\
 & + \sum_{r=1}^{n(q)} A_{qr} G_{qr} B_{qr}]| \\
 \leq \varepsilon/5 + \sum_{q \in Q} |1 + F_q - A_{q,n(q)+1}| \\
 & + \sum_{q \in Q} |G_q - \sum_{r=1}^{n(q)} A_{qr} G_{qr} B_{qr}| \\
 < 2\varepsilon/5 + \sum_{q \in Q} |G_q - \sum_{r=1}^{n(q)} G_{qr}| \\
 & + \sum_{q \in Q} |\sum_{r=1}^{n(q)} G_{qr} - \sum_{r=1}^{n(q)} A_{qr} G_{qr} B_{qr}| \\
 < 3\varepsilon/5 + \sum_{q \in Q} \sum_{r=1}^{n(q)} |1 - A_{qr}| |G_{qr}| \\
 & + \sum_{q \in Q} \sum_{r=1}^{n(q)} |A_{qr}| |G_{qr}| |1 - B_{qr}| \\
 < 3\varepsilon/5 + (\varepsilon/5B)B + (\varepsilon/5B^2)B^2 = \varepsilon .
 \end{aligned}$$

Hence, if $a \leq x < y \leq b$ and $\varepsilon > 0$, then there exist a subdivision D of $[a, b]$ and a number B such that if $H = \{x_q\}_0^n$ is a refinement of D and H_q is a subdivision of $[x_{q-1}, x_q]$, then

- (1) $|\Pi_i^j(1 + F_q + G_q)| < B$ for $1 \leq i \leq j \leq n$, and
- (2) $\sum_1^n |1 + F_q + G_q - \Pi_{H_q(I)}(1 + F + G)| < \varepsilon/B^2$.

Thus, if H and H_q are defined as above, then

$$\begin{aligned}
 & |\Pi_1^n(1 + F_q + G_q) - \Pi_1^n \Pi_{H_q(I)}(1 + F + G)| \\
 & \leq B^2 \sum_1^n |1 + F_q + G_q - \Pi_{H_q(I)}(1 + F + G)| \\
 & < B^2(\varepsilon/B^2) = \varepsilon .
 \end{aligned}$$

Therefore, ${}_x\Pi^y(1 + F + G)$ exists.

It now follows that $\int_a^b |1 + F + G - \Pi(1 + F + G)| = 0$. Hence, $F + G \in OM^\circ$ on $[a, b]$.

THEOREM 3. *If $F \in OQ^\circ, G \in OB^\circ$ and $1 + F + G$ is bounded away from zero on $[a, b]$, then $F + G \in OQ^\circ$ on $[a, b]$.*

Proof. There exist a subdivision D of $[a, b]$, a positive number $c < 1$ and a positive integer m such that if $J = \{x_q\}_0^n$ is a refinement of D , then

- (1) $|1 + F_q + G_q| > c$ for $1 \leq q \leq n$,
- (2) $|\Pi_i^j(1 + F_q)| > c$ for $1 \leq i \leq j \leq n$, and
- (3) if K is any collection of nonintersecting subsets of $J(I)$,

then the number of $k \in K$ such that $\sum_k |G|/c > 1/2$ is less than m .

Suppose $J = \{x_q\}_0^n$ is a refinement of D and $1 \leq r \leq s \leq n$. Let $K = \{k_j\}$ be the collection of nonintersecting subsets of $\{\{x_{q-1}, x_q\}\}_r^s$ such that

- (1) $k_1 = \{\{x_{q-1}, x_q\}\}_{m(1)}^{n(1)}$, where $m(1)$ is the first integer such that $m(1) \geq r$ and $|G_{m(1)}|/c \leq 1/2$ and $n(1)$ is the largest integer such that $n(1) < s, \sum_{m(1)}^{n(1)} |G_q|/c \leq 1/2$ and $\sum_{m(1)}^{n(1)+1} |G_q|/c > 1/2$ if such an integer

exists and s otherwise, and

(2) $k_j = \{\{x_{q-1}, x_q\}_{m(j)}^{n(j)}\}$, where $m(j)$ is the first integer such that $m(j) > n(j - 1)$ and $|G_{m(j)}|/c < 1/2$ and $n(j)$ is the largest integer such that $n(j) \leq s$, $\sum_{m(j)}^{n(j)} |G_q|/c \leq 1/2$ and $\sum_{m(j)}^{n(j)+1} |G_q|/c > 1/2$ if such an integer exists and s otherwise.

Let $U = \bigcup_{k \in K} k$ and $V = \{\{x_{q-1}, x_q\}_r\} - U$. Note that K and V each has a maximum of m elements. Thus,

$$\begin{aligned} & |\Pi_r^s(1 + F_q + G_q)| \\ &= \{\Pi_V |1 + F + G\} \{\Pi_U |1 + F + G\} \\ &\geq c^m \Pi_U [|1 + F| - |G|] \\ &= c^m \Pi_{k \in K} \{\Pi_k |1 + F|\} \{\Pi_k [1 - |G| (|1 + F|)^{-1}]\} \\ &\geq c^{2m} \Pi_{k \in K} \{\Pi_k (1 - |G|/c)\} \\ &\geq c^{2m} \Pi_{k \in K} [1 - \sum_k |G|/c] \geq c^{2m}/2^m. \end{aligned}$$

COROLLARY 3.1. *If $\int_a^b F$ exists, then the following are equivalent:*

- (1) $F \in OQ^\circ$ on $[a, b]$, and (2) $\int_a^b F \in OQ^\circ$ on $[a, b]$.

Indication of proof. Since $\int_a^b F$ exists, $F \in OA^\circ$ [Lemma 1.1]. The result now follows by using Theorem 3.

COROLLARY 3.2. *If G is a function, then the following are equivalent: (1) $G \in OQ^1$ on $[a, b]$, and (2) if $F \in OB^\circ$ on $[a, b]$, then $F + G \in OQ^1$ on $[a, b]$.*

Indication of proof. Since $F \equiv 0$ is in OB° , (2) implies (1). Further, it follows from Theorem 3 that (1) implies (2).

LEMMA 3.1. *If $0 \leq G \leq 1$ and $G \notin OB^\circ$ on $[a, b]$, then $-G \notin OQ^\circ$ on $[a, b]$.*

Indication of proof. If H is a subdivision of $[a, b]$, then

$$\begin{aligned} \Pi_{H(I)}(1 - G) &= \exp [\sum_{H(I)} \ln(1 - G)] \\ &= \exp [-\sum_{H(I)} \sum_1^\infty G^i/i]. \end{aligned}$$

Thus, $\Pi_{H(I)}(1 - G) \rightarrow 0$ as $\sum_{H(I)} G \rightarrow \infty$.

COROLLARY 3.3. *If G is a function, then the following are equivalent: (1) $G \in OB^\circ$ on $[a, b]$, and (2) if $F \in OQ^1$ on $[a, b]$, then $F + G \in OQ^1$ on $[a, b]$.*

Proof. Since it follows from Theorem 3 that (1) implies (2), we need only show that (2) implies (1). The function $|G|$ is almost bounded above on $[a, b]$ by $1/2$. If this is not so, then a contradiction follows by considering the function F such that

- (1) $F(x, y) = 0$ if $-1/2 \leq G(x, y) \leq 0$,
- (2) $F(x, y) = -G(x, y) - 1/2$ if $G(x, y) < -1/2$,
- (3) $F(x, y) = -2$ if $0 < G(x, y) \leq 1/2$, and
- (4) $F(x, y) = -G(x, y) - 3/2$ if $G(x, y) > 1/2$.

Thus, although $F \in OQ^1$, $F + G \notin OQ^1$ since $|1 + F + G| \leq 1$ and the number of intervals for which $|1 + F + G| = 1/2$ is unbounded. Now, if $G \notin OB^\circ$, a contradiction follows from Lemma 3.1 by using the function F such that

- (1) $F(x, y) = -2$ if $G(x, y) \geq 0$, and
- (2) $F(x, y) = 0$ if $G(x, y) < 0$.

THEOREM 4. *If G is a function, then the following are equivalent:*

- (1) *if $\int_a^b |F| = 0$, then $FG \in OB^\circ$,*
- (2) *if $\int_a^b |F| = 0$, then $FG \in OP^\circ$,*
- (3) *if $\int_a^b |F| = 0$, then $FG \in OQ^\circ$, and*
- (4) *G is bounded on $[a, b]$.*

Proof. It follows readily that (4) implies (1). Further, it follows that (4) implies (2) and (3) by using Theorems 1 and 3, respectively. If $G(x, y)$ as $x, y \rightarrow p^-$, $G(x, y)$ as $x, y \rightarrow p^+$, $G(x, p)$ as $x \rightarrow p^-$ and $G(p, x)$ as $x \rightarrow p^+$ are bounded for each $p \in [a, b]$, then it follows from the covering theorem that G is bounded on $[a, b]$. If one or more of these bounds fail to exist for some $p \in [a, b]$, then there exists a sequence $\{(y_q, z_q)\}_1^\infty$ of distinct subintervals of $[a, b]$ such that $|G(y_q, z_q)| > q^3$ for $q = 1, 2, \dots$, and if $\{x_j\}_0^\infty$ is a subdivision of $[a, b]$ and r is a positive integer then there exist positive integers i and j such that $j > r$ and $x_{i-1} \leq y_j < z_j \leq x_i$. Contradictions to (1) and (2) now follow by considering the function F such that

$$F(x, y) = [G(x, y)]/[q^2 |G(x, y)|]$$

if there exists a positive integer q such that $x = y_q$ and $y = z_q$ and $F(x, y) = 0$ otherwise. Here $\int_a^b |F| = 0$, but FG is in neither OB° nor OP° . Further, a contradiction to (3) follows by considering the function F such that $F(x, y) = [-G(x, y)]^{-1}$ if there exists a positive integer q such that $x = y_q$ and $y = z_q$ and $F(x, y) = 0$ otherwise.

LEMMA 5.1. *If G is a function such that*

- (1) *G is almost bounded above by $1/3$ on $[a, b]$, and*
- (2) *if $F \in OP^\circ$ on $[a, b]$, then $FG \in OP^\circ$ on $[a, b]$,*

then $G \in OB^\circ$ on $[a, b]$.

Proof. Suppose $G \notin OB^\circ$ on $[a, b]$. It follows from Theorem 4 that G is bounded on $[a, b]$. There exists a set $\{C(i)\}_1^\infty$ such that

(1) $C(i)$ is a finite set of nonoverlapping subintervals of $[a, b]$ which can be grouped into a collection $D(i)$ of nonintersecting pairs of adjacent intervals,

(2) no interval in $C(i + 1)$ has an end point which is also the end point of an interval in $C(q)$, $q = 1, 2, \dots, i$,

(3) if $(x, y) \in C(i)$, then $G(x, y) < 1/3$, and

(4) $\sum_{C(i)} |G| > i$.

Let $C = \bigcup_1^\infty D(i)$, and let F be the function on $[a, b]$ such that if $\{(u, v), (r, s)\} \in C$ and $G(u, v) \geq G(r, s)$, then

(a) $F(u, v) = -2$ if $G(u, v) < 0$,

(b) $F(u, v) = 2$ if $G(u, v) \geq 0$,

(c) $F(r, x) = -1$ if $r = v$ and $r < x$, and

(d) $F(x, s) = -1$ if $s = u$ and $x < s$,

and $F(x, y) = 0$ otherwise. Thus, $F \in OP^\circ$ on $[a, b]$. However,

$$[1 + F(u, v)G(u, v)][1 + F(r, s)G(r, s)] \geq 1 + |G(u, v)|/3.$$

Hence, since G is bounded and $\{\sum_{C(i)} |G|\}_1^\infty$ is unbounded, $FG \notin OP^\circ$. This is a contradiction, and therefore, $G \in OB^\circ$ on $[a, b]$.

LEMMA 5.2. *If G is a function such that*

- (1) *G is almost bounded below by $1/10$ on $[a, b]$, and*
- (2) *if $F \in OP^\circ$ on $[a, b]$, then $FG \in OP^\circ$ on $[a, b]$,*

then $G - 1 \in OB^\circ$ on $[a, b]$.

Proof. Suppose $G - 1 \notin OB^\circ$ on $[a, b]$. It follows from Theorem 4 that G is bounded on $[a, b]$. There exists a set $\{C(i)\}_1^\infty$ satisfying conditions (1) and (2) in Lemma 5.1 plus the additional conditions

(3) if $(x, y) \in C(i)$, then $G(x, y) > 1/10$, and

(4) $\sum_{C(i)} |G - 1| > i$.

Let $C = \bigcup_1^\infty D(i)$, where $D(i)$ is defined as in Lemma 5.1. Note that if $\{(u, v), (r, s)\} \in C$ and $G(u, v) \geq G(r, s)$, then either

(5) $G(u, v) \geq 1$ and $|1 - G(u, v)| \geq |1 - G(r, s)|$, or

(6) $G(r, s) < 1$ and either $G(u, v) = G(r, s)$ or

$$|1 - G(u, v)| < |1 - G(r, s)|.$$

Let F be the function on $[a, b]$ such that if $\{(u, v), (r, s)\} \in C$ and $G(u, v) \geq G(r, s)$, then

- (a) $F(u, v) = -2$ and $F(r, s) = 0$ if (5) is true,
 - (b) $F(u, v) = 1$ and $F(r, x) = -1/2$ if (6) is true, $r = v$ and $r < x$, and
 - (c) $F(u, v) = 1$ and $F(x, s) = -1/2$ if (6) is true, $s = u$ and $x < s$,
- and $F(x, y) = 0$ otherwise. Thus, $F \in OP^\circ$ on $[a, b]$. Observe that if (5) is true, then

$$[1 + F(u, v)G(u, v)][1 + F(r, s)G(r, s)] = -\{1 + 2[G(u, v) - 1]\},$$

and if (6) is true, then

$$\begin{aligned} [1 + F(u, v)G(u, v)][1 + F(r, s)G(r, s)] \\ \geq [1 + G(r, s)][1 - G(r, s)/2] \\ > 1 + [1/20][1 - G(r, s)]. \end{aligned}$$

Hence, since G is bounded and $\{\sum_{c(i)} |G - 1|\}_1^\infty$ is unbounded, $FG \notin OP^\circ$. This is a contradiction, and therefore, $G - 1 \in OB^\circ$ on $[a, b]$.

THEOREM 5. *If G is a function, then the following are equivalent:*

- (1) $G \in OB^*$ on $[a, b]$, and
- (2) if $F \in OP^\circ$ on $[a, b]$, then $FG \in OP^\circ$ on $[a, b]$.

Proof (2 \rightarrow 1). If $a \leq \alpha < b$, then there exists a number β such that $\alpha < \beta \leq b$ and either $G \in OB^\circ$ on $[\alpha, \beta]$ or $G - 1 \in OB^\circ$ on $[\alpha, \beta]$. If this is false and $a \leq \alpha < \beta < b$, then it follows from Lemmas 5.1 and 5.2 that G is neither almost bounded above by $1/3$ nor almost bounded below by $1/10$ on $[\alpha, \beta]$; hence, there exist sequences $\{s_p\}_1^\infty$ and $\{r_p\}_1^\infty$ such that

- (1) s_p and r_p are subintervals of $[a, b]$ with a common end point,
- (2) s_p precedes r_p and r_{p+1} precedes s_p , and
- (3) $G(s_p) < 1/10$ and $G(r_p) \geq 1/10$.

Let $H = \{s_p\}_1^\infty \cup \{r_p\}_1^\infty$, and let F be the function on $[a, b]$ such that

- (1) $F(x, y) = -1$ if there exists an interval $(z, y) \in H$ such that $x < y$ and $G(z, y) < 1/10$,
- (2) $F(x, y) = 2$ if $(x, y) \in H$ and $G(x, y) \geq 1/10$, and
- (3) $F(x, y) = 0$ otherwise.

Thus, $F \in OP^\circ$ on $[a, b]$. However, it follows that $FG \notin OP^\circ$ on $[a, b]$ since

$$[1 + F(s_p)G(s_p)][1 + F(r_p)G(r_p)] > (.9)(1.2) = 1.08.$$

Similarly, if $a < \beta \leq b$, then there exists a number α such that $a \leq \alpha < \beta$ and either $G \in OB^\circ$ on $[\alpha, \beta]$ or $G - 1 \in OB^\circ$ on $[\alpha, \beta]$. It now follows that $G \in OB^*$ on $[a, b]$ by using the covering theorem.

Proof (1 \rightarrow 2). Since $OB^\circ \subseteq OP^\circ$, if $G \in OB^\circ$ and $F \in OP^\circ$ on $[x, y]$, then $FG \in OP^\circ$ on $[x, y]$. Note that

$$1 + FG = 1 + F + F(G - 1) .$$

Thus, it follows from Theorem 1 that if $G - 1 \in OB^\circ$ and $F \in OP^\circ$ on $[x, y]$, then $FG \in OP^\circ$ on $[x, y]$. Therefore, (1) must imply (2).

COROLLARY 5.1. *If G is a function, then the following are equivalent:*

- (1) $G \in OP^\circ$ on $[a, b]$, and
- (2) if $F \in OB^*$ on $[a, b]$, then $FG \in OP^\circ$ on $[a, b]$.

Indication of proof. It follows that (1) implies (2) by using Theorem 5 and that (2) implies (1) by considering the function $F \equiv 1$.

LEMMA 6.1. *If G is a bounded function such that*

- (1) G is almost bounded above by $1/3$ on $[a, b]$, and
- (2) if $F \in OQ^\circ$ and is bounded on $[a, b]$ and $1 + FG$ is bounded

away from zero, then $FG \in OQ^\circ$ on $[a, b]$,
then $G \in OB^\circ$ on $[a, b]$.

Proof. Suppose $G \notin OB^\circ$ on $[a, b]$. There exist a subdivision D of $[a, b]$ and a positive integer m such that if J is a refinement of D and $u \in J(I)$ then $|G(u)|/m < 1/2$. Let H be the set such that $u \in H$ only if there exists a refinement J of D such that $u \in J(I)$, and let F be the function such that

- (1) $F(u) = -2$ if $u \in H$ and $0 \leq G(u) \leq 1/3$,
- (2) $F(u) = 1/m$ if $u \in H$ and $G(u) < 0$, and
- (3) $F(x, y) = 0$ otherwise.

Since $F \in OQ^\circ$ and $1 + FG$ is bounded away from zero, $FG \in OQ^\circ$. However, it follows from Lemma 3.1 that $FG \notin OQ^\circ$. This is a contradiction, and therefore, $G \in OB^\circ$.

LEMMA 6.2. *If G is a bounded function such that*

- (1) G is almost bounded below by $1/10$ on $[a, b]$, and
- (2) if $F \in OQ^\circ$ and is bounded on $[a, b]$ and $1 + FG$ is bounded

away from zero, then $FG \in OQ^\circ$ on $[a, b]$,
then $G - 1 \in OB^\circ$ on $[a, b]$.

Proof. There exist a subdivision D of $[a, b]$ and a number B such that if J is a refinement of D and $u \in J(I)$ then $|G(u)| < B$. Let H be the set such that $u \in H$ only if there exists a refinement J of D such that $u \in J(I)$. Let H_1 and H_2 be the subsets of H such that $u \in H_1$ only if $G(u) \leq 1$ and $u \in H_2$ only if $G(u) > 1$. For $i = 1, 2$, let $G_i(x, y) = G(x, y)$ if $(x, y) \in H_i$ and $G_i(x, y) = 0$ if $(x, y) \notin H_i$.

Suppose $G_1 - 1 \notin OB^\circ$ on $[a, b]$. Let F be the function such that

- (1) $F(u) = -2$ if $u \in H_1$ and $G(u) < 5/12$ or $7/12 < G(u) \leq 1$,
- (2) $F(u) = -3$ if $u \in H_1$ and $5/12 \leq G(u) \leq 7/12$, and
- (3) $F(x, y) = 0$ otherwise.

Since $F \in OQ^\circ$ and $1 + FG$ is bounded away from zero, $FG \in OQ^\circ$. However, it follows from Lemma 3.1 that $FG \notin OQ^\circ$. This is a contradiction, and therefore, $G_1 - 1 \in OB^\circ$.

Suppose $G_2 - 1 \notin OB^\circ$ on $[a, b]$. There exist a set $\{C(i)\}_1^\infty$ and an integer $m > 1$ such that

- (1) $C(i)$ is a finite set of nonoverlapping subintervals of $[a, b]$ which can be grouped into a collection $D(i)$ of nonintersecting pairs $\{(u, v), (r, s)\}$ of adjacent intervals such that either $G(u, v) > 1$ or $G(r, s) > 1$,
- (2) no interval in $C(i + 1)$ has an end point which is also the end point of an interval in $C(q), q = 1, 2, \dots, i$,
- (3) if $(x, y) \in C(i)$ then $G(x, y) > 1/10$ and $G(x, y)/m < 1/2$, and
- (4) $\sum_{C(i)} |G_2 - 1| > i$.

Let $C = \bigcup_1^\infty D(i)$, and let F be the function such that if $\{(u, v), (r, s)\} \in C$ and $G(u, v) \geq G(r, s)$ then $F(u, v) = -1/m, F(r, x) = 1/(m - 1)$ if $r = v$ and $F(x, s) = 1/(m - 1)$ if $s = u$, and $F(x, y) = 0$ otherwise. Since $F \in OQ^\circ$ and $1 + FG$ is bounded away from zero, $FG \in OQ^\circ$. However, if $\{(u, v), (r, s)\} \in C$ and $G(u, v) \geq G(r, s)$, then

$$\begin{aligned} 0 &< [1 + F(u, v)G(u, v)][1 + F(r, s)G(r, s)] \\ &\leq [1 - G(u, v)/m][1 + G(u, v)/(m - 1)] \\ &< 1 + [1 - G(u, v)]/m(m - 1). \end{aligned}$$

It follows from Lemma 3.1 that $FG \notin OQ^\circ$. This is a contradiction, and therefore, $G_2 - 1 \in OB^\circ$.

Thus, since $G_i - 1 \in OB^\circ$ on $[a, b]$ for $i = 1, 2$, it follows that $G - 1 \in OB^\circ$ on $[a, b]$.

THEOREM 6. *If G is a bounded function, then the following are equivalent:*

- (1) $G \in OB^*$ on $[a, b]$, and
- (2) if $F \in OQ^\circ$ and is bounded on $[a, b]$ and $1 + FG$ is bounded away from zero, then $FG \in OQ^\circ$ on $[a, b]$.

Proof (2 \rightarrow 1). If $a \leq \alpha < b$, then there exists a number β such that $\alpha < \beta \leq b$ and either $G \in OB^\circ$ on $[\alpha, \beta]$ or $G - 1 \in OB^\circ$ on $[\alpha, \beta]$. If this is false, then it follows from Lemmas 6.1 and 6.2 that there exist sequences $\{s_p\}_1^\infty$ and $\{r_p\}_1^\infty$ and a set H defined as in Theorem 5. Let F be a function on $[\alpha, b]$ such that if (u, v) and (v, s) are intervals in H such that $G(u, v) \leq 1/10$ and $G(v, s) \geq 1/10$, then

(1) $1 + F(u, v)G(u, v) = 1/2$ and $F(v, s) = 0$ if $G(u, v) < -1/10$,

(2) $F(x, v) = 1$, $-1/2 \leq F(v, s) < 0$ and $1/2 \leq 1 + F(v, s)G(v, s) \leq .95$ if $-1/10 \leq G(u, v) \leq 0$, and

(3) $F(x, v) = -3$, $-1/2 \leq F(v, s) < 0$ and $1/2 \leq 1 + F(v, s)G(v, s) \leq .95$ if $0 < G(u, v) < 1/10$,

and $F(x, y) = 0$ otherwise. Since F is a bounded function in OQ° such that $1 + FG$ is bounded away from zero, $FG \in OQ^\circ$. However,

$$|[1 + F(s_p)G(s_p)][1 + F(r_p)G(r_p)]| \leq .95.$$

Hence, $FG \notin OQ^\circ$. Similarly, if $a < \beta \leq b$, then there exists a number α such that $a \leq \alpha < \beta$ and either $G \in OB^\circ$ on $[\alpha, \beta]$ or $G - 1 \in OB^\circ$ on $[\alpha, \beta]$. It now follows that $G \in OB^*$ on $[a, b]$ by using the covering theorem.

Proof (1 \rightarrow 2). This follows from Theorem 3 by a procedure similar to that used in Theorem 5.

The Supporting Institutions listed above contribute to the cost of publication of this Journal, but they are not owners or publishers and have no responsibility for its content or policies.

Mathematical papers intended for publication in the *Pacific Journal of Mathematics* should be in typed form or offset-reproduced, (not dittoed), double spaced with large margins. Underline Greek letters in red, German in green, and script in blue. The first paragraph or two must be capable of being used separately as a synopsis of the entire paper. Items of the bibliography should not be cited there unless absolutely necessary, in which case they must be identified by author and Journal, rather than by item number. Manuscripts, in duplicate if possible, may be sent to any one of the four editors. Please classify according to the scheme of Math. Rev. Index to Vol. 39. All other communications to the editors should be addressed to the managing editor, or Elaine Barth, University of California, Los Angeles, California, 90024.

50 reprints are provided free for each article; additional copies may be obtained at cost in multiples of 50.

The *Pacific Journal of Mathematics* is issued monthly as of January 1966. Regular subscription rate: \$48.00 a year (6 Vols., 12 issues). Special rate: \$24.00 a year to individual members of supporting institutions.

Subscriptions, orders for back numbers, and changes of address should be sent to Pacific Journal of Mathematics, 103 Highland Boulevard, Berkeley, California, 94708.
