**SCATTERED COMPACTIFICATION FOR  $N \cup \{p\}$**

M. JAYACHANDRAN AND M. RAJAGOPALAN

# SCATTERED COMPACTIFICATION FOR $N \cup \{p\}$

M. JAYACHANDRAN AND M. RAJAGOPALAN

In this paper, it is shown that the scattered space  $N \cup \{p\}$  admits a scattered Hausdorff compactification for a large class of points  $p$  in  $\beta N - N$ . This gives a partial solution to the following problem raised by Z. Semadeni in 1959: "Is there a scattered Hausdorff compactification for the space  $N \cup \{p\}$  where  $p$  is any point of  $\beta N - N$ ?" (See "Sur les ensembles clairsemés," *Rozprawy Matematyczne*, 19 (1959).) The proofs are purely topological and the compactifications are easy to visualize.

In 1970, C. Ryll-Nardzewski and R. Telgarsky [5], using deep results from Boolean Algebras, have proved that  $N \cup \{p\}$  has a scattered compactification if  $p$  is a  $P$ -point of  $\beta N - N$ . In the first section of this paper, it is shown that the space  $\gamma N$  constructed by S. P. Franklin and M. Rajagopalan [1] serves as a scattered compactification for  $N \cup \{p\}$  when  $p$  is a  $P$ -point of  $\beta N - N$ . In the second section, a scattered Hausdorff compactification for  $N \cup \{p\}$  is provided, when  $p$  is a  $P$ -point of order 2 for  $\beta N - N$  (definition follows). In this case, it is also shown that the compactification of  $N \cup \{p\}$  is a space  $Y$  such that  $Y - N$  is a homeomorph of  $[1, \Omega] \times \gamma N$ .

**DEFINITION 1.1.** A  $P$ -point of  $\beta N - N$  is said to be  $P$ -point of order 1 for  $\beta N - N$ . Suppose that for  $n \in N$ , we have defined a  $P$ -point of order  $n$ . Then we define a  $P$ -point of order  $n + 1$  to be a  $P$ -point of the derived set of a countable set of  $P$ -points each being of order  $n$  in  $\beta N - N$ .

We will now proceed to get a scattered compactification for  $N \cup \{p\}$  where  $p$  is a  $P$ -point of order 1 for  $\beta N - N$ , by constructing a suitable quotient space of  $\beta N$  which is scattered and Hausdorff and which contains  $N \cup \{p\}$  as a dense subspace. The following two lemmas are easy to prove and their proofs are omitted.

**LEMMA 1.2.** Let  $p$  be a  $P$ -point of order 1 for  $\beta N - N$ . Then using continuum hypothesis  $\beta N - N - \{p\}$  can be written as the union of a collection  $\{F_\alpha\}_{\alpha \in [1, \Omega]}$  of clopen sets in  $\beta N - N$  such that  $F_\alpha \subset F_\beta$  for all  $\alpha, \beta \in [1, \Omega]$  such that  $\alpha < \beta$ .

**LEMMA 1.3.** Let  $\pi$  be a partition of  $\beta N - N$  such that the quotient space  $(\beta N - N)/\pi$  is Hausdorff in its quotient topology. Let  $\tilde{\pi}$  be the partition of  $\beta N$  where each member of  $N$  is a member of  $\tilde{\pi}$  and each member of  $\pi$  is also a member of  $\tilde{\pi}$ . Then  $Y = \beta N/\tilde{\pi}$

is compact and Hausdorff and the image of  $N$  in  $Y$  is an open discrete dense subspace of  $Y$ .

Further, if  $(\beta N - N)/\pi$  is scattered in quotient topology,  $Y$  is also scattered in quotient topology.

**LEMMA 1.4.** *Let  $p \in \beta N - N$ . Let  $\pi$  be a partition of  $\beta N - N$  such that  $\{p\} \in \pi$  and  $(\beta N - N)/\pi$  is Hausdorff. Let  $\tilde{\pi}$  be the partition of  $\beta N$  as described in Lemma 1.3. Let  $\tilde{q}: \beta N \rightarrow \beta N/\tilde{\pi} = Y$  be the canonical map. Then  $\tilde{q}$  is a homeomorphism when restricted to  $N \cup \{p\}$ .*

*Proof.* Clearly  $\tilde{q}|(N \cup \{p\}): N \cup \{p\} \rightarrow N \cup \{p\}$  is continuous, one-to-one and onto. Also  $\tilde{q}: \beta N \rightarrow \beta N/\tilde{\pi}$  is continuous,  $\beta N$  is compact and by Lemma 1.3,  $Y$  is  $T_2$ . Therefore  $\tilde{q}$  is a closed map and hence upper semi-continuous. Let  $O \subset N \cup \{p\}$  be open relative to  $N \cup \{p\}$ . Then  $O = (N \cup \{p\}) \cap \bigcup U$  where  $U$  is open in  $\beta N$ . Let  $W$  be the union of all partition classes with respect to  $\tilde{\pi}$  within  $U$ . Then, by the upper semicontinuity of  $\tilde{q}$ ,  $W$  is open in  $\beta N$ . Since  $W$  is also saturated under  $\tilde{\pi}$ ,  $\tilde{q}(W)$  is open in  $\beta N/\tilde{\pi}$ . Also  $W \cap (N \cup \{p\}) = O$  and hence  $\tilde{q}(W) \cap \tilde{q}(N \cup \{p\}) = \tilde{q}(O)$ . Therefore,  $\tilde{q}(O)$  is open relative to  $\tilde{q}(N \cup \{p\})$ . Thus,  $\tilde{q}|(N \cup \{p\})$  is an open map. Therefore,  $\tilde{q}|(N \cup \{p\})$  is a homeomorphism.

**LEMMA 1.5.** *Let  $p$  be a  $P$ -point of  $\beta N - N$ . Then there exists a partition  $\pi$  for  $\beta N - N$  such that (i)  $\{p\} \in \pi$  and (ii) the induced quotient space  $X = (\beta N - N)/\pi$  is homeomorphic to  $[1, \Omega]$ .*

*Proof.* By Lemma 1.2,  $\beta N - N - \{p\}$  can be written as  $\bigcup_{\alpha \in [1, \Omega]} F_\alpha$  such that  $F_\alpha$  is clopen in  $\beta N - N$  for each  $\alpha$  and  $F_\alpha \subset F_\beta \forall \alpha, \beta \in [1, \Omega]$  such that  $\alpha < \beta$ . Put  $H_1 = F_1$  and for each  $\alpha$  such that  $1 < \alpha < \Omega$ , put  $H_\alpha = F_\alpha - \bigcup_{1 \leq \gamma < \alpha} F_\gamma$ , and put  $H_\Omega = \{p\}$ . Then the collection  $\{H_\alpha\}_{\alpha \in [1, \Omega]}$  forms a partition  $\pi$  of  $\beta N - N$  by closed sets in  $\beta N - N$ . Let  $q: \beta N - N \rightarrow (\beta N - N)/\pi$  be the induced quotient map. Let  $q(H_\alpha) = b_\alpha$  for all  $\alpha \in [1, \Omega]$ . Let  $\tau_1$  be the usual order topology induced on  $\{b_\alpha | 1 \leq \alpha \leq \Omega\}$  by the bijection  $b_\alpha \rightarrow \alpha$  from  $\{b_\alpha | 1 \leq \alpha \leq \Omega\}$  onto  $[1, \Omega]$  and let  $\tau_2$  be the quotient topology on  $\{b_\alpha | 1 \leq \alpha \leq \Omega\}$  induced on it by the partition  $\pi$  of  $\beta N - N$ . Then the topologies  $\tau_1$  and  $\tau_2$  on  $\{b_\alpha | 1 \leq \alpha \leq \Omega\}$  are both compact and Hausdorff and comparable and hence they are homeomorphic.

**THEOREM 1.6.** *Let  $p$  be a  $P$ -point of order 1 for  $\beta N - N$ . Then  $N \cup \{p\}$  has a scattered compactification.*

*Proof.* Let  $\pi$  be the partition of  $\beta N - N$  obtained as in Lemma

1.4. Then  $\{p\} \in \pi$  and the quotient space  $(\beta N - N)/\pi = X$  is homeomorphic to  $[1, \Omega]$ . Hence  $X$  is a compact, scattered and Hausdorff space. Let  $\tilde{\pi}$  be the partition of  $\beta N$  as in Lemma 1.3. Then, by Lemma 4,  $\beta N/\tilde{\pi}$  contains a homeomorphic copy of  $N \cup \{p\}$ . Since  $N$  is dense in  $\beta N$ ,  $N \cup \{p\}$  is dense in  $\beta N/\tilde{\pi}$ . Thus,  $\beta N/\tilde{\pi}$  is a scattered, Hausdorff compactification for  $N \cup \{p\}$ .

REMARK 1.6a. The above scattered Hausdorff compactification of  $N \cup \{p\}$  is a space  $X$  such that the remainder  $X - N$  is homeomorphic to  $[1, \Omega]$ . This compact Hausdorff space  $X$  is called  $\gamma N$  by S. P. Franklin and M. Rajagopalan in [1].

2. Scattered Hausdorff compactification for  $N \cup \{p\}$  where  $p$  is  $P$ -point of order 2 in  $\beta N - N$ :

NOTATIONS. Let  $p \in \beta N - N$ . Let  $p$  be a  $P$ -point of order 2 in  $\beta N - N$ . Then there exists a countable set  $\{p_1, p_2, \dots, p_n, \dots\}$  of distinct  $P$ -points in  $\beta N - N$  such that  $P$  is a  $P$ -point of the set

$$B = \text{cl}_{\beta N - N} \{p_1, p_2, p_3, \dots, \dots, p_n, \dots\} - \{p_1, p_2, \dots, p_n, \dots\}.$$

LEMMA 2.7. *There exists a countable collection  $\{O_n\}_{n \in N}$  of clopen sets in  $\beta N - N$  such that (i)  $O_n \cap O_m = \emptyset$  for  $n, m \in N$  such that  $n \neq m$  and (ii)  $p_n \in O_n \forall n = 1, 2, 3, \dots$*

*Proof.* Using the zero dimensionality of  $\beta N - N$  and the fact that  $p_1$  is a  $P$ -point for  $\beta N - N$ , we can get a clopen set  $O_1$  in  $\beta N - N$  containing  $p_1$  and disjoint with  $\{p_2, p_3, \dots, p_n, \dots\} \cup \{p\}$ . Since,  $p_2$  is a  $P$ -point of  $\beta N - N$ , we get a clopen set  $F_2$  in  $\beta N - N$  containing  $p_2$  and disjoint with  $p_1, p_3, p_4, \dots, p_n, \dots, p$ . Put  $O_2 = F_2 - O_1$ . Proceeding like this, by induction, for each  $n \in N$ , we can get a clopen set  $O_n$  in  $\beta N - N$  satisfying the conditions (i) and (ii) of the Lemma 2.7.

LEMMA 2.8. *Let  $O$  be any  $\sigma$ -compact subset of  $\beta N - N$ . Then  $\text{cl}_{\beta N - N}^{(0)} = \beta O$ .*

*Proof.* This follows from the fact that  $O$  is a dense subset of the compact set  $\text{cl}_{\beta N - N}(O)$  and any continuous function  $f: O \rightarrow [0, 1]$  admits a continuous extension to  $\beta N$ .

COROLLARY 2.9. *Let the collection  $\{O_n\}_{n \in N}$  be as in Lemma 2.7. Let  $\text{cl}_{\beta N - N}(\bigcup_{n=1}^{\infty} O_n) = M$ . Then  $\bigcup_{n=1}^{\infty} O_n$  is a  $\sigma$ -compact subset of*

$\beta N - N$  and  $M = \beta(\bigcup_{n=1}^{\infty} O_n)$ .

**COROLLARY 2.10.** *Let  $\{p_1, p_2, \dots, p_n, \dots\}$  be a countable collection of  $P$ -points of  $\beta N - N$ . Let  $B = \text{cl}_{\beta N - N} \{p_1, p_2, \dots, p_n, \dots\} - \{p_1, p_2, \dots, p_n, \dots\}$ . Then  $B \cup \{p_1, p_2, \dots, p_n, \dots\} = \beta(\{p_1, \dots, p_n, \dots\})$ .*

**NOTE 2.11.** Let  $X$  be any Tychonoff space. Let  $A \subset X$  be clopen in  $X$ . Then  $\text{cl}_{\beta X} A$  is clopen in  $\beta X$ .

*Proof.* The function  $f: X \rightarrow [0, 1]$  given by

$$\begin{aligned} f(x) &= 0, \text{ for all } x \in A \\ &= 1, \text{ for all } x \in X - A \end{aligned}$$

is continuous on  $X$ . Therefore,  $f$  admits a continuous extension  $\tilde{f}: \beta X \rightarrow [0, 1]$ . Then, it is clear that  $\tilde{f}(x) = 0$  for all  $x \in \text{cl}_{\beta X} A$  and  $\tilde{f}(x) = 1$  for all  $x \in \beta X - \text{cl}_{\beta X} A$ . Hence, the result follows.

**LEMMA 2.12.** *Let the collection  $\{O_n\}_{n \in N}$  be as in Lemma 2.7. Let  $B$  be as in Corollary 2.10. Let  $\text{cl}_{\beta N - N} (\bigcup_{n=1}^{\infty} O_n) = M$ . Let  $M - \bigcup_{n=1}^{\infty} O_n = K$ . Then, there exists an increasing collection  $\{A_\alpha\}_{\alpha \in [1, \Omega]}$  of clopen sets relative to  $K$  such that  $\bigcup_{\alpha \in [1, \Omega]} A_\alpha = K - B$ .*

*Proof.* For each  $n \in N$ ,  $p_n$  is a  $P$ -point of  $\beta N - N$  and  $p_n \in O_n$ . Hence,  $p_n$  is a  $P$ -point of  $O_n$  for all  $n = 1, 2, 3, \dots$ . Therefore, as in Lemma 1.2, using continuum hypothesis, for each  $n \in N$ ,  $O_n - \{p_n\}$  can be expressed as the union of an increasing collection  $\{A_{\alpha n}\}_{\alpha \in [1, \Omega]}$  of clopen sets relative to  $O_n$  (and hence relative to  $\beta N - N$  also). For each  $n \in N$ , put  $A_\alpha = [\text{cl}_{\beta N - N} (\bigcup_{n=1}^{\infty} A_{\alpha n})] \cap K$ . Then, by Corollary 2.9 and Note 2.11 above,  $A_\alpha$  is clopen relative to  $K$  for all  $\alpha \in [1, \Omega]$ . Since  $A_{\alpha n} \subset A_{\beta n}$  for  $\alpha < \beta$ ,  $\alpha, \beta \in [1, \Omega]$ , it follows that  $A_\alpha \subset A_\beta$  for all  $\alpha, \beta \in [1, \Omega]$  such that  $\alpha < \beta$ .

Now it remains to show that  $\bigcup_{\alpha \in [1, \Omega]} A_\alpha = K - B$ . Clearly  $A_\alpha \cap B = \emptyset$  for all  $\alpha \in [1, \Omega]$  and hence  $\bigcup_\alpha A_\alpha \subset K - B$ . To get the other inclusion, let  $x_0 \in K - B$ . Now,  $K - B$  is open relative to  $K$  and  $K$  is zero-dimensional. Therefore, there exists a clopen set  $V$  relative to  $K$  such that  $x_0 \in V \subset K - B$ . Since  $V \subset K$  is clopen in  $K$  and  $\beta N - N$  is zero dimensional, there exists a clopen set  $W$  in  $\beta N - N$  such that  $V = W \cap K$ . Put  $W \cap O_n = W_n$  for all  $n = 1, 2, 3, \dots$ . We note that  $p_n$  can belong to  $W_n$  for at most a finite number of  $n$ 's. Therefore,  $\exists k_0 \in N$  such that  $p_n \notin W_n \forall n > k_0$ . Hence, for each  $n > k_0$ , there exists a countable ordinal  $\alpha_n$  such that  $A_{\alpha_n n} \supset W_n$ . Let the supremum of  $\alpha_n$  for  $n > k_0$ , be  $\gamma$ . Then  $A_\gamma \supset W_n \forall n > k_0$ . Therefore,

$$\bigcup_{n=k_0+1}^{\infty} A_{\gamma n} \supset \bigcup_{n=k_0+1}^{\infty} W_n.$$

Hence,

$$\begin{aligned} \overline{\bigcup_{n=1}^{\infty} A_{\gamma n}} \cap K &= A_{\gamma} = \overline{\bigcup_{n=k_0+1}^{\infty} A_{\lambda n}} \cap K \\ &= \overline{\bigcup_{n=k_0+1}^{\infty} W_n} \cap K \\ &= \overline{\bigcup_{n=1}^{\infty} W_n} \cap K \\ &= \overline{\bigcup_{n=1}^{\infty} (W \cap O_n)} \cap K \\ &= W \cap M \cap K \\ &= W \cap K \\ &= V. \end{aligned}$$

Also  $x_0 \in V$ . Therefore,  $\bigcup_{\alpha \in [1, \Omega)} A_{\alpha} = K - B$ .

**LEMMA 2.13.** *Let  $B$  be as defined in Corollary 2.10 and let  $K$  be as in Lemma 2.12. Then, there exists a collection  $\{X_{\alpha}\}_{\alpha \in [1, \Omega)}$  of clopen sets relative to  $K$  such that  $X_{\alpha} \subset X_{\beta} \forall \alpha, \beta \in [1, \Omega)$  such that  $\alpha < \beta$  and  $[\bigcup_{\alpha \in [1, \Omega)} X_{\alpha}] \cap B = B - \{p\}$ .*

*Proof.* Now,  $p$  is a  $P$ -point of  $B$  and hence, using continuum hypothesis,  $B - \{p\}$  can be written as the union of an ascending collection  $\{B_{\alpha}\}_{\alpha \in [1, \Omega)}$  of clopen sets relative to  $B$ . Since, by Corollary 2.10,  $B \cup \{p_1, p_2, \dots, p_n, \dots\} = \beta(\{p_1, \dots, p_n, \dots\})$ , each  $B_{\alpha}$  gives a subset  $N_{\alpha} = \{p_{n_1}^{\alpha}, \dots, p_{n_k}^{\alpha}, \dots\}$  of  $\{p_1, p_2, \dots, p_n, \dots\}$  such that

$$\text{cl}_{\beta N - N}(N_{\alpha}) \cap B_{\alpha} = B.$$

Since  $B_{\alpha} \subset B_{\beta}$  for  $\alpha < \beta$ , we have  $N_{\alpha}$  is almost contained in  $N_{\beta}$  for  $\alpha < \beta$ . Put  $[\text{cl}_{\beta N - N}(\bigcup_{k=1}^{\infty} O_{n_k}^{\alpha})] \cap K = X_{\alpha} \forall \alpha \in [1, \Omega]$ . Then  $X_{\alpha}$  is clopen in  $K \forall \alpha \in [1, \Omega)$ ,  $X_{\alpha} \subset X_{\beta}$  for  $\alpha < \beta$ ,  $X_{\alpha} \cap B = B_{\alpha} \forall \alpha \in [1, \Omega)$  and also  $(\bigcup_{\alpha} X_{\alpha}) \cap B = \bigcup_{\alpha} (X_{\alpha} \cap B) = \bigcup_{\alpha} B_{\alpha} = B - \{p\}$ .

**LEMMA 2.14.** *Let the collection  $\{O_n\}_{n \in N}$ ,  $M$  and  $K$  be as in Lemma 2.12. Let  $\beta N - N - M = T$ . Let  $\{C_{\alpha}\}_{\alpha \in [1, \Omega)}$  be an ascending collection of clopen sets relative to  $K$ . Then, there exists an ascending collection  $\{I_{\alpha}\}_{\alpha \in [1, \Omega)}$  of subsets of  $T \cup K$  such that each  $I_{\alpha}$  is clopen in  $T_{\alpha} \cup K$ ,  $I_{\alpha} \cap K = C_{\alpha} \forall \alpha \in [1, \Omega)$  and  $\bigcup_{\alpha} I_{\alpha} - \bigcup_{\alpha} C_{\alpha} = T$ .*

*Proof.* Using the fact that  $\beta N - N$  is zero-dimensional and is of weight  $c$  and also using the fact that the clopen sets of  $\beta N - N$

satisfy the Dubois-Reymond separability condition, we can write  $T$  as the union of an ascending collection  $\{G_\alpha\}_{\alpha \in [1, \Omega]}$  of clopen sets in  $\beta N - N$  such that  $G_\alpha \cap M = \phi \forall \alpha \in [1, \Omega]$ .

Now,  $C_1$  is clopen in  $K$ . Since  $\beta N - N$  is zero-dimensional,  $\exists$  a clopen set  $J_1$  in  $\beta N - N$  such that  $J_1 \cap K = C_1$ . Put  $[J_1 \cap (T \cup K)] \cup G_1 = I_1$ . Then  $I_1$  is clopen in  $T \cup K$  and  $I_1 \cap K = C_1$ . Suppose that we have constructed clopen sets  $I_1, I_2, \dots, I_n$  in  $T \cup K$  for  $n \in N$  such that  $I_1 \subset I_2 \subset \dots \subset I_n$  and  $I_j \cap K = C_j$  for  $j = 1, 2, \dots, n$ . Then we construct  $I_{n+1}$  as follows: Since  $C_{n+1}$  is clopen in  $K$  and  $\beta N - N$  is zero-dimensional, there exists a clopen set  $J_{n+1}$  in  $\beta N - N$  such that  $J_{n+1} \cap K = C_{n+1}$ . Put  $I_{n+1} = [J_{n+1} \cap (T \cup K)] \cup I_n \cup G_{n+1}$ . Then  $I_{n+1}$  is clopen in  $T \cup K$ ,  $I_{n+1} \supset I_n$  and  $I_{n+1} \cap K = C_{n+1}$ . Having constructed  $I_1 \subset I_2 \subset \dots \subset I_n \subset \dots$  we now proceed to construct  $I_\omega$ . First, we claim that  $\text{cl}_{\beta N - N}(\bigcup_{n=1}^\infty I_n) \cap (K - C_\omega) = \emptyset$ . For, let  $x_0 \in K - C_\omega$ , which is clopen in  $K$ . Since  $\beta N - N$  is zero-dimensional, there exists a clopen set  $H_\omega$  in  $\beta N - N$  such that  $H_\omega \cap K = K - C_\omega$ . Let  $H_\omega \cap I_n = H_{n\omega} \forall n = 1, 2, 3, \dots$ . Then  $H_{n\omega}$  is closed in  $\beta N - N$ . We will now prove that  $H_{n\omega}$  is also open in  $\beta N - N$ . Since,  $I_n$  is clopen in  $T \cup K$  and  $\beta N - N$  is zero dimensional, there exists a clopen set  $\Gamma_n$  in  $\beta N - N$  such that  $\Gamma_n \cap (T \cup K) = I_n$ . Then  $\Gamma_n \cap [(T \cup K) \cap K] = I_n \cap K = C_n$ . Now

$$\begin{aligned} H_{n\omega} &= (H_\omega \cap I_n) = H_\omega \cap [\Gamma_n \cap (T \cup K)] \\ &= H_\omega \cap [(\Gamma_n \cap T) \cup (\Gamma_n \cap K)] \\ &= (H_\omega \cap \Gamma_n \cap T) \cup (H_\omega \cap \Gamma_n \cap K) \\ &= (H_\omega \cap \Gamma_n \cap T) \cup [(K - C_\omega) \cap \Gamma_n] \\ &= (H_\omega \cap \Gamma_n \cap T) \cup [K \cap (K - C_\omega) \cap \Gamma_n] \\ &= (H_\omega \cap \Gamma_n \cap T) \cup [(C_n \cap (K - C_\omega))] \\ &= H_\omega \cap \Gamma_n \cap T \text{ which is open in } \beta N - N. \end{aligned}$$

Therefore,  $H_{n\omega}$  is clopen in  $\beta N - N$ . Also  $\beta N - N - O_1, \beta N - N - (O_1 \cup O_2), \dots$  form a decreasing countable collection of clopen sets in  $\beta N - N$  such that  $(\beta N - N - \bigcup_{i=1}^n O_i) \supset H_{m\omega} \forall m, n = 1, 2, 3, \dots$ . Therefore, by Dubois-Reymond separability condition, there exists a clopen set  $H$  in  $\beta N - N$  such that  $H \subset T$  and  $H \supset \bigcup_{n=1}^\infty H_{n\omega}$ . Therefore,  $(\beta N - N - H) \cap H_\omega$  is a clopen set in  $\beta N - N$  and  $x_0 \in (\beta N - N - H) \cap H_\omega$ . Also  $[(\beta N - N - H) \cap H_\omega] \cap (\bigcup_{n=1}^\infty I_n) = \emptyset$ . Therefore  $x_0 \notin \text{cl}_{\beta N - N}(\bigcup_{n=1}^\infty I_n)$ . Hence,  $(K - C_\omega) \cap \overline{(\bigcup_{n=1}^\infty I_n)} = \emptyset$ . Now  $C_\omega \cup \text{cl}_{\beta N - N}(\bigcup_{n=1}^\infty I_n)$  and  $K - C_\omega$  are disjoint closed sets in  $\beta N - N$  which is normal. Therefore, there exist disjoint open sets  $D_1, D_2$  in  $\beta N - N$  such that

$$D_1 \supset C_\omega \cup \text{cl}_{\beta N - N} \left( \bigcup_{n=1}^\infty I_n \right) \quad \text{and} \quad D_2 \supset K - C_\omega.$$

Now  $\beta N - N$  is zero dimensional,  $C_\omega \cup \text{cl}_{\beta N - N}(\bigcup_{n=1}^\infty I_n)$  is a compact subset of  $\beta N - N$  and  $D_1$  is an open set in  $\beta N - N$  containing  $C_\omega \cup \text{cl}_{\beta N - N}(\bigcup_{n=1}^\infty I_n)$ . Hence, there exists a clopen set  $J_\omega$  in  $\beta N - N$  such that  $D_1 \supset J_\omega \supset C_\omega \cup \text{cl}_{\beta N - N}(\bigcup_{n=1}^\infty I_n)$ . Now,  $J_\omega \cap D_2 = \emptyset$  and hence  $(K - C_\omega) \cap J_\omega = \emptyset$ . Therefore,  $J_\omega \cap K = C_\omega$ . Take  $I_\omega = [J_\omega \cap (T \cup K)] \cup H_\omega$ . Then  $I_\omega$  is clopen in  $T \cup K$ ,  $I_\omega \supset \bigcup_{n=1}^\infty I_n$  and  $I_\omega \cap K = C_\omega$ . Continuing this process, we get an increasing collection  $\{I_\alpha\}_{\alpha \in [1, \Omega]}$  of clopen sets in  $T \cup K$  such that  $I_\alpha \cap K = C_\alpha \forall \alpha \in [1, \Omega]$ . It can also be seen that  $\bigcup_\alpha I_\alpha - \bigcup_\alpha C_\alpha = T$ .

**COROLLARY 2.15.** *Let the collection  $\{A_\alpha\}_{\alpha \in [1, \Omega]}$  be as in Lemma 2.12. Then, there exists a collection  $\{S_\alpha\}_{\alpha \in [1, \Omega]}$  of clopen sets in  $T \cup K$  such that  $S_\alpha \subset S_\beta \forall \alpha, \beta \in [1, \Omega]$  such that  $\alpha < \beta$ ,  $S_\alpha \cap K = A_\alpha \forall \alpha \in [1, \Omega]$  and  $\bigcup_\alpha S_\alpha - \bigcup_\alpha A_\alpha = T$ .*

**COROLLARY 2.16.** *Let the collection  $\{x_\alpha\}_{\alpha \in [1, \Omega]}$  be as in Lemma 2.13. Then, there exists an increasing collection  $\{L_\alpha\}_{\alpha \in [1, \Omega]}$  of clopen sets in  $T \cup K$  such that  $L_\alpha \cap K = X_\alpha \forall \alpha \in [1, \Omega]$  and  $\bigcup_\alpha L_\alpha - \bigcup_\alpha X_\alpha = T$ .*

**DEFINITION 2.17.** Let  $\sigma_1$  and  $\sigma_2$  be two partitions of a nonempty set  $X$ . Then we define  $\sigma_1 \cap \sigma_2$  to be the partition of  $X$  given by the collection  $\{A \cap B \mid A \in \sigma_1, B \in \sigma_2, A \cap B \neq \emptyset\}$  of nonempty subsets of  $X$ .

**LEMMA 2.18.** *Let  $X$  be a compact Hausdorff space. Let  $\sigma_1, \sigma_2$  be two Hausdorff partitions for  $X$ . Then  $\sigma_1 \cap \sigma_2$  is also a Hausdorff partition for  $X$ .*

*Proof.* Let  $X/\sigma_1 = Y_1$  and  $X/\sigma_2 = Y_2$ . Let  $q_1: X \rightarrow Y_1$  and  $q_2: X \rightarrow Y_2$  be the corresponding quotient maps. Define  $(q_1, q_2): X \rightarrow Y_1 \times Y_2$  by  $(q_1, q_2)(x) = (q_1(x), q_2(x)) \forall x \in X$ . This is a continuous function from  $X$  into  $Y_1 \times Y_2$ . Now  $Y_1 \times Y_2$  is Hausdorff. Consider  $(q_1, q_2)$  as a map from  $X$  onto  $(q_1, q_2)(X)$ . Let the partition induced on  $X$  by this map be  $\sigma$ . Then  $\sigma = \sigma_1 \cap \sigma_2$ . Let  $q: X \rightarrow X/\sigma$  be the corresponding quotient map. Let  $g: X/\sigma \rightarrow (q_1, q_2)(X)$  be the natural fill-up map making the following diagram commutative.

$$\begin{array}{ccc}
 X & \xrightarrow[\substack{(q_1, q_2) \\ \text{Cont., onto}}]{} & (q_1, q_2)(X) \\
 & \searrow \substack{\text{continuous } q \\ \text{Onto}} & \nearrow \substack{\text{Onto one-to-one} \\ \text{continuous } g} \\
 & X/\sigma & \\
 & \text{Compact} & 
 \end{array}$$

Now  $X/\sigma$  is compact,  $(q_1, q_2)(X)$  is Hausdorff and  $g$  is one-to-one, onto and continuous. Hence  $g$  is a homeomorphism. Since  $(q_1, q_2)(X)$  is Hausdorff, it follows that  $X/\sigma$  is Hausdorff. Therefore  $\sigma_1 \cap \sigma_2$  is a Hausdorff partition for  $X$ .

In the above proof, we also note that the quotient space induced by  $\sigma_1 \cap \sigma_2$  is homeomorphic to the range of the function  $(q_1, q_2)$  in  $Y_1 \times Y_2$ .

LEMMA 2.19. *Let  $T$  and  $K$  be as in Lemma 2.14. Let  $B$  and  $p$  be as in Lemma 2.13. Then, there exists a Hausdorff partition for  $T \cup K$  with  $\{p\}$  as a separate partition class.*

*Proof.* Let the collection  $\{S_\alpha\}_{\alpha \in [1, \varrho]}$  be as in Corollary 2.15 and let the collection  $\{L_\alpha\}_{\alpha \in [1, \varrho]}$  be as in Corollary 2.16. Put  $H_1 = S_1$  and for each  $\alpha \in [2, \varrho]$ ,  $H_\alpha = S_\alpha - \bigcup_{1 \leq \gamma < \alpha} S_\gamma$  and  $H_\varrho = K - \bigcup_\alpha A_\alpha = B$ . Also, let  $M_1 = L_1$ ; for each  $\alpha \in [2, \varrho]$ ,  $M_\alpha = L_\alpha - \bigcup_{1 \leq \gamma < \alpha} L_\gamma$  and  $M_\varrho = K - \bigcup_{\alpha \in [1, \varrho]} X_\alpha$ . Then, the collection  $\{H_\alpha\}_{\alpha \in [1, \varrho]}$  gives a partition  $\pi_1$  for  $T \cup K$  such that the quotient space  $(T \cup K)/\pi_1$  is homeomorphic to  $[1, \varrho]$ . Therefore,  $\pi_1$  is a Hausdorff partition for  $T \cup K$ . Similarly, the collection  $\{M_\alpha\}_{\alpha \in [1, \varrho]}$  gives a Hausdorff partition  $\pi_2$  for  $T \cup K$ . Let  $\pi_1 \cap \pi_2 = \pi_3$ . Then, by Lemma 2.18,  $\pi_3$  is a Hausdorff partition for  $T \cup K$ . Also

$$\begin{aligned} H_\varrho \cap M_\varrho &= B \cap \left( K - \bigcup_\alpha X_\alpha \right) \\ &= B - \bigcup_\alpha (B \cap X_\alpha) \\ &= B - \bigcup_\alpha B_\alpha = \{p\}. \end{aligned}$$

LEMMA 2.20. *Let  $X$  be a topological space. Let  $A_1$  and  $A_2$  be closed in  $X$ . Let  $A_1 \cup A_2 = X$ . Let  $A \subset X$  be such that  $A \cap A_1$  is open relative to  $A_1$  and  $A \cap A_2$  is open relative to  $A_2$ . Then  $A$  is open in  $X$ .*

*Proof.* This follows from the fact that

$$A = (O_1 - A_2) \cup (O_2 - A_1) \cup (O_1 \cap O_2).$$

LEMMA 2.21. *Let  $\pi_3$  be the partition of  $T \cup K$  as obtained in the proof of Lemma 2.19. Let the collection of sets  $\{A_{\alpha_k}\}_{\substack{\alpha \in [1, \varrho] \\ k \in N}}$  be as obtained in the proof of Lemma 2.12. Let  $\{p_1, p_2, \dots, p_n, \dots\}$  be as in Corollary 2.10. For each  $k \in N$ , let  $D_{\alpha_k} = A_{\alpha_k} - \bigcup_{1 \leq \gamma < \alpha} A_{\gamma_k}$ . Then the collection of sets  $\{D_{\alpha_k}\}_{\substack{\alpha \in [1, \varrho] \\ k \in N}}$  and  $\{p_n\}_{n \in N}$  together with the members of  $\pi_3$  form a Hausdorff partition  $\pi_4$  for  $\beta N - N$ .*

*Proof.* Clearly  $\pi_4$  is a partition for  $\beta N - N$ . We will now prove that  $(\beta N - N)/\pi_4$  is Hausdorff. Given any two partition classes  $C_1$  and  $C_2$  of  $\beta N - N$  with respect to  $\pi_4$ , we must prove that there exists a clopen set  $Y_1$  in  $\beta N - N$  containing  $C_1$ , disjoint with  $C_2$  and saturated under  $\pi_4$ . The cases where either  $C_1$  or  $C_2$  is a  $D_{\alpha_k}$  or a  $p_n$  are easy to handle and we consider the following cases:

*Case 1.* Let  $C_1 = H_\alpha \cap M_\beta$  and  $C_2 = H_\alpha \cap M_\gamma$  where  $\alpha, \beta, \gamma \in [1, \Omega]$  and  $\beta \neq \gamma$ . Without loss of generality, we can assume that  $\beta < \gamma$ . Now, by definition  $X_\beta = \text{cl}_{\beta N - N}(\bigcup_{k=1}^\infty O_{n_k^\beta}) \cap K$  where  $\text{cl}_{\beta N - N}(\{p_{n_1^\beta}, \dots, p_{n_k^\beta}, \dots\}) \cap B = B_\beta$  (see the proof of Lemma 2.13). Also  $L_\beta \cap K = X_\beta$  where  $L_\beta$  is clopen in  $T \cup K$  (see Corollary 2.16). Now,  $Y_1 = L_\beta \cup \text{cl}_{\beta N - N}(\bigcup_{k=1}^\infty O_{n_k^\beta})$  is closed in  $\beta N - N$  and using Lemma 2.20, we can see that it is also open in  $\beta N - N$ . Further  $Y_1 \supset C_1$  and  $Y_1 \cap C_2 = \emptyset$ . Also,  $Y_1$  is saturated under  $\pi_4$ .

*Case 2.* Let  $C_1 = H_\alpha \cap M_\beta$  and  $C_2 = H_\gamma \cap M_\delta$  where  $\alpha, \beta, \gamma, \delta \in [1, \Omega]$  and  $\alpha \neq \gamma$ . Without loss of generality, we can assume that  $\alpha < \gamma$ . In this case, using Lemma 2.20, we can verify that the set  $Y_1 = \text{cl}_{\beta N - N}(\bigcup_{n=1}^\infty A_{\alpha_n}) \cup S_\alpha$  is clopen in  $\beta N - N$ . Further,  $Y_1 \supset C_1$  and  $Y_1 \cap C_2 = \emptyset$ . Also  $Y_1$  is saturated under  $\pi_4$ . Therefore,  $\pi_4$  is a Hausdorff partition for  $\beta N - N$ .

**LEMMA 2.22.** *Let  $\pi_4$  be the Hausdorff partition of  $\beta N - N$  as given in Lemma 2.21. Let  $\pi_5$  be the partition of  $M$  given by  $\pi_5 = \pi_4|_M = \{X \cap M \mid X \in \pi_4\}$ . Then  $\pi_5$  is a Hausdorff partition for  $M$ .*

*Proof.* Let  $D_{\alpha_k}$ ,  $p_n$ ,  $B$  and  $O_n$  be as in above lemmas. Let  $E_1 = A_1$  and  $E_\alpha = A_\alpha - \bigcap_{1 \leq \gamma < \alpha} A_\gamma$ ,  $\forall \alpha \in [2, \Omega]$ . Then, it is easy to see that the partition  $\pi_6$  of  $M$  given by the collection  $\{D_{\alpha_k}\}_{\alpha \in [1, \Omega], k \in N}$ ,  $\{p_n\}_{n \in N}$ ,  $\{E_\alpha\}_{\alpha \in [1, \Omega]}$  and  $B$  is a Hausdorff partition for  $M$ . Let  $K_1 = X_1$  and  $K_\alpha = X_\alpha - \bigcup_{1 \leq \gamma < \alpha} X_\gamma$ ,  $\forall \alpha \in [1, \Omega]$ . Also, let  $K_\Omega = K - \bigcup_{\alpha \in [1, \Omega]} X_\alpha$ . Then, the partition  $\pi_7$  of  $M$  given by the collection  $\{O_n\}_{n \in N}$  and  $\{K_\alpha\}_{\alpha \in [1, \Omega]}$  is also a Hausdorff partition for  $M$ . Further  $\pi_5 = \pi_6 \cap \pi_7$ . Hence, by Lemma 2.18,  $\pi_5$  is a Hausdorff partition for  $M$ .

**LEMMA 2.23.** *Let  $M$ ,  $\pi_4$  and  $\pi_5$  be as in previous lemmas. Then  $M/\pi_5$  is homeomorphic to  $(\beta N - N)/\pi_4$ .*

*Proof.* Let  $(\beta N - N)/\pi_4 = Y$  and let  $q_4: \beta N - N \rightarrow Y$  be the quotient map induced by the partition  $\pi_4$  of  $\beta N - N$ . Then, by Lemma 2.21,  $Y$  is Hausdorff. Now, the map  $q_4|_M: M \rightarrow Y$  is a continuous function from  $M$  onto  $Y$  where  $M$  is compact and  $Y$  is Hausdorff. Hence, the topology of  $Y$  is the quotient topology of  $M$  induced on

it by the function  $q_4/M$ . But  $q_4$  induces the partition  $\pi_5$  on  $M$ . Therefore,  $M/\pi_5$  is homeomorphic to  $Y = (\beta N - N)/\pi_4$ .

**LEMMA 2.24.** *Let all notations be as in previous lemmas. Then  $M/\pi_5$  is homeomorphic to  $\gamma N \times [1, \Omega]$  where  $\gamma N$  is the compactification of  $N$  constructed by S. P. Frankline and M. Rajagopalan in [1]. (See also remark 1.6a).*

*Proof.* Now  $\pi_5 = \pi_6 \cap \pi_7$  where  $\pi_6$  and  $\pi_7$  are Hausdorff partitions of  $M$  as given in the proof of Lemma 2.22. Let  $q_6: M \rightarrow M/\pi_6$  and  $q_7: M \rightarrow M/\pi_7$  be the corresponding quotient maps. Consider the function  $(q_6, q_7): M \rightarrow M/\pi_6 \times M/\pi_7$  given by  $(q_6, q_7)(x) = (q_6(x), q_7(x)) \forall x \in M$ . Since  $\pi_6 \cap \pi_7 = \pi_5$ , it follows from Lemma 2.18 that  $M/\pi_5$  is homeomorphic to the range of the function  $(q_6, q_7)$  from  $M$  into  $M/\pi_6 \times M/\pi_7$ . But it can be seen that  $M/\pi_6$  is homeomorphic to  $[1, \Omega] \times [1, \omega]$  with its usual product topology and  $M/\pi_7$  is homeomorphic to  $\gamma N$  and that the range of the map  $(q_6, q_7)$  is homeomorphic to  $[1, \Omega] \times \gamma N$ . Hence,  $M/\pi_5$  is homeomorphic to  $[1, \Omega] \times \gamma N$ .

**THEOREM 2.25.**  *$N \cup \{p\}$  has a scattered Hausdorff compactification, when  $p$  is a  $P$ -point of order 2 for  $\beta N - N$ .*

*Proof.* Consider the partition  $\pi_4$  of  $\beta N - N$  given in Lemma 2.21. Let  $\tilde{\pi}_4$  be the partition of  $\beta N$  whose members are the members of  $\pi_4$  and the singletons in  $N$ . Since,  $(\beta N - N)/\pi_4$  is Hausdorff, by Lemma 1.3, it follows that  $\beta N/\tilde{\pi}_4$  is Hausdorff. Since  $\beta N$  is compact, we have  $\beta N/\tilde{\pi}_4$  is compact. Since  $(\beta N - N)/\pi_4$  is homeomorphic to  $[1, \Omega] \times \gamma N$  which is scattered, we have that  $\beta N/\tilde{\pi}_4$  is also scattered. Since  $N$  is dense in  $\beta N$  and  $N \cup \{p\}$  maps homeomorphically onto itself under the quotient map from  $\beta N$  onto  $\beta N/\tilde{\pi}_4$  (Lemma 1.4), it follows that  $N \cup \{p\}$  is dense in  $\beta N/\tilde{\pi}_4$ . Thus,  $\beta N/\tilde{\pi}_4$  is a scattered Hausdorff compactification for  $N \cup \{p\}$ . Hence the theorem.
