# A THEOREM ON PRIME DIVISORS OF ZERO AND CHARACTERIZATIONS OF UNMIXED LOCAL DOMAINS

L. J. RATLIFF, JR.

**Two characterizations of when the prime divisors of zero in a complete local ring are all minimal are given. Then a number of results which characterize an unmixed local domain  $R$  of altitude two are proved. Among these are when certain over-rings of  $R$  are finite  $R$ -modules and when  $R$  is a subspace of certain Macaulay over-rings. Finally, some characterizations of when an arbitrary local domain is unmixed are given.**

1. Introduction. All rings in this article are assumed to be commutative with identity, and the terminology is, in general, the same as that in [6].

In this paper a number of characterizations of when a local domain  $R$  is unmixed are proved. The main emphasis is on the case when altitude  $R = 2$  (§§3-5), but some characterizations for arbitrary local domains are given in §6. (One reason why characterizations of  $R$  being unmixed when altitude  $R = 2$  are of value is that if  $(L, N)$  is a local domain such that altitude  $L > 2$ , then certain monadic transformations  $Q$  of  $L$  are altitude two local domains, and if  $L$  is a subspace of such a  $Q$ , then  $L$  is unmixed if and only if  $Q$  is unmixed (4.15). Another reason is that, in answer to a question asked by M. Nagata in 1956 in [5, Problem 1], D. Ferrand and M. Raynaud showed in 1970 in [2, Proposition 3.3] that there exist quasi-unmixed local domains of altitude two which aren't unmixed. This is considered somewhat more fully in §5.) A number of these characterizations in altitude two are due to a more general theorem concerning when the prime divisors of zero in a complete local ring are all minimal, and others have to do with certain Macaulay over-rings of  $R$ .

A brief summary of the results in this paper will now be given. Throughout the remainder of this introduction  $(R, M)$  is a local domain such that altitude  $R = 2$ .

The main result in §2 shows that if  $(L, N)$  is a complete local ring and altitude  $L \geq 2$ , then every prime divisor of zero in  $L$  is minimal and has depth  $> 1$  if and only if there exist a regular element  $b \in N$  and  $n \geq 1$  such that  $(bL)^{(n)} \subseteq bL$ , where  $(bL)^{(n)}$  is the intersection of the height one primary components of  $b^n L$  (2.2).

In §3, using (2.2), six characterizations of when  $R$  (altitude two) is unmixed are given in (3.4) and (3.6). Among these are:  $(bR)^{(n)} \subseteq$

$bR$ , for some  $0 \neq b \in M$  and  $n \geq 1$ ; and, there exist a system of parameters  $b, c$  in  $R$  and  $n \geq 1$  such that  $b^k R : c^n R = (bR)^{(k)}$ , for all  $k \geq 1$ .

Section 4 contains some characterizations of  $R$  being unmixed in terms of  $R$  being a subspace of rings of the form  $A_P$ , where  $b, c$  is a system of parameters in  $R$  and  $P$  is a prime ideal in  $A = R[b/c]$  such that  $MA \subseteq P$ . Specifically,  $R$  is unmixed if and only if  $R$  is a subspace of one such ring which is Macaulay if and only if  $R$  is a subspace of all such rings (4.9) and (4.10). Some further results on when  $A$  is locally Macaulay or when  $A_{(M, b/c)}$  is Macaulay are given in (4.1), (4.5), (4.7), and (4.8).

Section 5 contains characterizations of  $R$  being unmixed or quasi-unmixed in terms of  $R^{(1)}$  and  $R'$  (5.1). (5.2) contains some supplemental information on the relationships between the rings  $R$ ,  $R^{(1)}$ , and  $R'$ .

In §6 a sufficient condition for a local ring  $L$  to be unmixed is given in (6.1). Then, using (6.1), a number of characterizations of when  $L$  is unmixed and of when  $L/p$  is unmixed, for all  $p \in \text{Spec } L$ , are given in (6.3)–(6.9).

**2. A theorem on prime divisors of zero.** The main result in this section gives two characterizations of when every prime divisor of zero in a complete local ring is minimal and has depth  $> 1$  (2.2). To prove (2.2) we need the following definition.

**DEFINITION 2.1.** Let  $b$  be a regular element in a Noetherian ring  $A$ . Then  $(bA)^{(n)} = b^n A_S \cap A$ , where  $S = A - \bigcup \{p \in \text{Spec } A; p \text{ is a height one prime divisor of } bA\}$ .

Thus, by the definition,  $(bA)^{(n)}$  is the isolated component of  $b^n A$  determined by the minimal prime divisors of  $b^n A$ .

In (2.2) we restrict attention to local rings of altitude  $\geq 2$ , since if  $(R, M)$  is a local ring and altitude  $R = 1$ , then every prime divisor of zero in  $R$  is minimal if and only if  $M$  contains regular elements, and if altitude  $R = 0$ , then every prime divisor of zero in  $R$  is minimal. I am indebted to S. McAdam for showing that (2.2.1)  $\Rightarrow$  (2.2.2) for all local rings (instead of just for complete local rings).

**THEOREM 2.2.** Let  $(R, M)$  be a local ring such that altitude  $R \geq 2$ , and consider the following statements:

(2.2.1) Each prime divisor  $z$  of zero in  $R$  is such that height  $z = 0$  and depth  $z > 1$ .

(2.2.2) There exists a regular element  $b \in M$  such that  $\bigcap_n (bR)^{(n)} = (0)$ .

(2.2.3) There exist a regular element  $b \in M$  and  $n \geq 1$  such that  $(bR)^{(n)} \subseteq bR$ .

Then  $(2.2.3) \Rightarrow (2.2.2) \Leftrightarrow (2.2.1)$ . Moreover, if  $R$  is complete, then all three statements are equivalent.

*Proof.* It will be shown in (3.3.2) below that if  $(bR)^{(n)} \subseteq bR$ , then  $(bR)^{(n+i)} \subseteq b^{i+1}R$ , for all  $i \geq 0$ , so  $(2.2.3) \Rightarrow (2.2.2)$ .

Assume that (2.2.2) holds, and let  $\mathcal{S}$  be the set of height one prime divisors of  $bR$ . Then  $(0) = \bigcap_n (bR)^{(n)} = \bigcap \{ \bigcap_n b^n R_p \cap R; p \in \mathcal{S} \} = \bigcap \{ (0)R_p \cap R; p \in \mathcal{S} \}$ . Therefore, if  $z$  is a prime divisor of  $(0)$  in  $R$ , then there exists  $p \in \mathcal{S}$  such that  $z \subset p$ , so height  $z = 0$  and depth  $z > 1$  (since altitude  $R \geq 2$ ), so (2.2.1) holds.

$(2.2.1) \Rightarrow (2.2.2)$  Let  $U = \{q \in \text{Spec } R; \text{ there exists a prime divisor } z \text{ of zero such that } z \subset q \text{ and height } q/z = 1 < \text{height } q\}$ . Then, by hypothesis,  $U$  is a finite set (possibly empty) [4, Theorem 1] and  $M \notin U$ . Therefore let  $b$  be a regular element in  $M$  such that  $b \notin \bigcup \{q; q \in U\}$ . Let  $\mathcal{S}$  be the set of height one prime divisors of  $bR$ , and assume it is known that for each prime divisor  $z$  of  $(0)$ , there exists  $p \in \mathcal{S}$  such that  $z \subset p$ . Then  $(0) =$  (by assumption)  $\bigcap \{ (0)R_p \cap R; p \in \mathcal{S} \} = \bigcap \{ \bigcap_n b^n R_p \cap R; p \in \mathcal{S} \} = \bigcap_n (bR)^{(n)}$ . Therefore it remains to show that each prime divisor of zero is contained in some  $p \in \mathcal{S}$ .

For this, let  $z$  be a prime divisor of zero and consider  $R/z$ . Then the Principal Ideal Theorem implies that  $M/z$  is the union of  $\{Q/z; z \subset Q \in \text{Spec } R \text{ and height } Q/z = 1\}$ . Therefore there exists  $Q \in \text{Spec } R$  such that  $(z, b)R \subseteq Q$  and height  $Q/z = 1$ . By the choice of  $b$ , height  $Q = 1$ , so  $Q \in \mathcal{S}$ , and so (2.2.2) holds. In fact, it has been shown that:

(2.2.4) For each regular element  $b \in M$ ,  $b \notin \bigcup \{q; q \in U\}$ ,  $\bigcap_n (bR)^{(n)} = (0)$ .

Finally, assume that  $R$  is complete and that (2.2.1) holds. Let  $U$  and  $b$  be as in the proof that  $(2.2.1) \Rightarrow (2.2.2)$ , let  $P$  be a prime divisor of  $bR$ , and let  $m$  be a positive integer. Then to show that (2.2.3) holds it suffices to show that there exists  $k \geq 1$  such that  $(bR)^{(k)} \subseteq P^{(m)} = P^m R_P \cap R$  (since  $bR$  has a primary decomposition and primary ideals contain large symbolic powers of their prime divisor).

For this, it may clearly be assumed that height  $P > 1$ . Let  $(S, N)$  be the completion of  $(R_P, PR_P)$ . Then, since  $R$  is complete, for each prime divisor  $z$  of  $(0)$  in  $R_P$ , the completion  $(R_P/z)^*$  of  $R_P/z$  is analytically unramified and unmixed [5, Proposition 4]. Therefore, all prime divisors of  $(0)$  in  $S$  are minimal, for if  $w$  is a prime divisor of zero in  $S$ , then  $w$  is a prime divisor of  $zS$ , for some prime divisor  $z$  of  $(0)$  in  $R_P$ , so height  $w = 0$  (since  $S/zS \cong (R_P/z)^*$  is analytically unramified). Suppose there exists a prime divisor  $z'$  of  $(0)$  in  $R$  such that  $z' \subset P$  and height  $P/z' = 1$ . Then height  $P = 1$ , since  $b \notin \bigcup \{q; q \in U\}$ ; contradiction. Therefore every prime

divisor of  $(0)$  in  $R_p$  has depth  $>1$ , so every prime divisor of  $(0)$  in  $S$  has depth  $>1$  (since the  $(R_p/z)^*$  are unmixed). Thus  $S$  satisfies the conditions on  $R$  in (2.2.1). Now, if it can be shown that  $b \notin \bigcup \{q'; q' \in U'\}$ , where  $U' = \{q' \in \text{Spec } S; \text{ there exists a prime divisor } w \text{ of zero in } S \text{ such that } w \subset q' \text{ and height } q'/w = 1 < \text{height } q'\}$ , then  $\bigcap_n (bS)^{(n)} = (0)$  (by (2.2.4) applied to  $S$ ). It then follows that, given  $m \geq 1$ , there exists  $k$  such that  $(bS)^{(k)} \subseteq N^m$  [6, (30.1)]. So, since height one prime divisors of  $bS$  contract to height one prime divisors of  $bR_p$ ,  $(bR_p)^{(k)} \subseteq (bS)^{(k)} \cap R_p \subseteq N^m \cap R_p = P^m R_p$ , hence  $(bR)^{(k)} \subseteq P^{(m)}$ . Thus it remains to show that  $b \notin \bigcup \{q'; q' \in U'\}$ .

For this, suppose  $b \in \bigcup \{q'; q' \in U'\}$  and let  $p \in U'$  such that  $b \in p$ . Then there exists a (minimal) prime divisor  $w$  of  $(0)$  in  $S$  such that  $(w, b)S \subseteq p$  and height  $p/w = 1 < \text{height } p$ . Since height  $p/w = 1$ ,  $p$  is a prime divisor of  $bS$  (by [17, Lemma 1, p. 394] applied to  $S_p$ ), so  $q = p \cap R_p$  is a prime divisor of  $bR_p$ , by [6, (18.11)]. Since height  $p > 1$ , there exists another prime divisor  $w'$  of  $(0)$  in  $S$  such that  $w' \subset p$  and depth  $w' > \text{depth } w$  (since  $S$ , being complete, is catenary). Therefore  $z' = w' \cap R_p \neq w \cap R_p = z$  (since  $S/zS$  is unmixed). Thus  $z'$  and  $z$  are contained in  $q$  and depth  $z' = \text{depth } w' > \text{depth } w = \text{depth } z$ , so height  $q > 1$  (since  $R_p$  is catenary, (since  $R$  is catenary)). Also, height  $p/zS = 1$  and  $b + zS \in p/zS$ , so height  $((p/zS) \cap (R_p/z)) = 1$ , hence height  $q/z = 1$ . Therefore height  $(q \cap R)/(z \cap R) = 1$  and height  $q \cap R > 1$ , so  $b \in q \cap R \in U$ ; contradiction. Therefore  $b \notin \bigcup \{q'; q' \in U'\}$ , so (2.2.3) holds.

REMARK 2.3. The proof that  $(2.2.1) \Rightarrow (2.2.3)$  shows that for each regular element  $b \in M$  such that  $b \notin \bigcup \{q; q \in U\}$ , there exists  $n \geq 1$  such that  $(bR)^{(n)} \subseteq bR$  (assuming that  $R$  is complete).

It should be noted that if altitude  $R = 2$  in (2.2), then the proof that  $(2.2.1) \Rightarrow (2.2.3)$  follows immediately from [6, (30.1)] (and the fact that  $(2.2.1) \Rightarrow (2.2.2)$ ), since then  $S = R$  (with  $S$  as in the proof that  $(2.2.1) \Rightarrow (2.2.3)$ ). It should also be mentioned that a somewhat different proof that  $(2.2.2) \Rightarrow (2.2.1)$  in an arbitrary Noetherian ring such that each maximal ideal has height  $>1$  is given in [15, Lemma 4.11].

COROLLARY 2.4. *Let  $(R, M)$  be a quasi-unmixed local domain such that altitude  $R \geq 2$ , and let  $R^*$  be the completion of  $R$ . Then the following statements are equivalent:*

(2.4.1)  *$R$  is unmixed.*

(2.4.2) *There exists  $0 \neq b \in M$  such that  $\bigcap_n (bR^*)^{(n)} = (0)$ .*

(2.4.3) *For each  $0 \neq b \in M$ , there exists  $n \geq 1$  such that  $(bR^*)^{(n)} \subseteq bR^*$ .*

*Proof.* If (2.4.1) holds, then, since the set  $U$  (for  $R^*$ ) of the

proof that  $(2.2.1) \Rightarrow (2.2.3)$  is empty,  $(2.4.3)$  holds by  $(2.3)$ .

$(2.4.3) \Rightarrow (2.4.2)$ , by  $(3.3.2)$  below.

If  $(2.4.2)$  holds, then the prime divisors of zero in  $R^*$  are all minimal  $(2.2)$ , so, since  $R$  is quasi-unmixed (by hypothesis),  $(2.4.1)$  holds.

It will be shown in  $(3.4)$  that a much nicer result than  $(2.4)$  holds when altitude  $R = 2$ .

**3. Some characterizations of unmixed local domains of altitude two.** It will be shown in this section that  $(2.2)$  can be used to give a number of characterizations of an unmixed local domain of altitude two. In fact, six such characterizations are given in  $(3.4)$  and  $(3.6)$ .

Most of the results in this section can be extended to altitude two local rings (with nonzero divisors of zero), but we shall restrict attention to the domain case. On the other hand, only a small part of the results extend to local domains of altitude  $> 2$ .

To prove  $(3.4)$  and  $(3.6)$  we need the following definitions.

**DEFINITIONS 3.1.** Let  $A$  be a Noetherian domain, and let  $b$  be a nonzero element in  $A$ .

$(3.1.1)$   $A^{(1)} = \bigcap \{A_p; p \text{ is a height one prime ideal in } A\}$ .

$(3.1.2)$   $\mathcal{T}(bA) = A[1/b] \cap A^{(1)}$ .

$(3.1.3)$  An ideal  $I$  in  $A$  is *pure height one* in case every prime divisor of  $I$  has height one.

Quite a few results concerning one or another of these concepts are given in [3, §§5.10 and 5.11], [9, §5], [10, pp. 218-219], and [15, Chapter 2] (among other possible references). The following remark lists the known facts which are needed for the remainder of this paper.

**REMARK 3.2.** Let  $b$  a nonzero non-unit in a Noetherian domain. Then the following statements hold:

**3.2.1.** [10, Corollary 2.19(1)]. There exists a one-to-one correspondence between the height one prime ideals  $p$  in  $A$  and the height one prime ideals  $q$  in  $A^{(1)}$ :  $p$  and  $q$  correspond if and only if  $A_p = A_q^{(1)}$ .

**3.2.2.** [3, (5.10.17) (1)]. Each proper nonzero principal ideal in  $A^{(1)}$  is pure height one.

**3.2.3.** [9, Lemma 5.15(3)] and [15, Lemma 2.11(3)].  $\mathcal{T}(bA)$  is the set of elements which, for all large  $k$ , can be written in the form  $c/b^k$  with  $c \in (bA)^{(k)}$ .

**3.2.4.** [9, Lemma 5.15(4)] and [15, Lemma 2.17(1)].  $b^k \mathcal{T}(bA) \cap$

$A = (bA)^{(k)}$ , for all  $k \geq 1$ .

3.2.5. [9, Lemma 5.15(10)].  $\mathcal{S}(bA)$  is a finite  $A$ -algebra if and only if  $b^n \mathcal{S}(bA) \subseteq A$ , for some  $n \geq 1$ .

3.2.6. [9, Lemma 5.15(4)] and [15, Lemma 2.11(5)].  $b \mathcal{S}(bA)$  is pure height one.

The following lemma will serve to shorten the proofs of 3.4 and 3.6.

LEMMA 3.3. *Let  $b$  be a regular nonunit in a Noetherian ring  $A$ . Then the following statements hold:*

3.3.1.  $(bA)^{(n)} : b^i A = (bA)^{(n-i)}$ , for all  $n \geq i \geq 0$ .

3.3.2. If  $(Ab)^{(n)} \subseteq bA$ , for some  $n \geq 1$ , then  $(bA)^{(m)} = b^{m-n+1}(bA)^{(n-1)}$ , for all  $m \geq n$ .

*Proof.* 3.3.1.  $(bA)^{(n)} : b^i A$  and  $(bA)^{(n-i)}$  are pure height one, they have the same height one prime divisors as  $bA$ , and  $((bA)^{(n)} : b^i A)A_p = b^{n-i}A_p = ((bA)^{(n-i)})A_p$ , for each height one prime divisor  $p$  of  $bA$ , hence they are equal.

3.3.2. Let  $m \geq n$ , so  $(bA)^{(m)} = (bA)^{(m)} \cap bA = b((bA)^{(m)} : bA) =$  3.3.1  $b(bA)^{(m-1)}$ , so the conclusion follows by induction on  $m - n$ .

The first main result in this section gives four characterizations of an unmixed local domain of altitude two. Of these, it is already known that 3.4.1  $\Leftrightarrow$  3.4.5, by [9, Theorem 3.5] (which is a sharpened version of [3, 7.2.5]).

THEOREM 3.4. *The following statements are equivalent for a local domain  $(R, M)$  such that altitude  $R = 2$ :*

3.4.1.  $R$  is unmixed.

3.4.2.  $(bR)^{(n+i)} = b^i(bR)^{(n)}$ , for each  $0 \neq b \in M$ , for some  $n$  depending on  $b$ , and for all  $i \geq 0$ .

3.4.3.  $(bR)^{(n)} \subseteq bR$ , for some  $0 \neq b \in M$  and for some  $n$ .

3.4.4.  $\mathcal{S}(bR)$  is a finite  $R$ -algebra, for some  $0 \neq b \in M$ .

3.4.5.  $R^{(1)}$  is a finite  $R$ -algebra.

*Proof.* Assume that 3.4.1 holds and let  $0 \neq b \in M$ . Then, with  $R^*$  the completion of  $R$ , the set  $\{q \in \text{Spec } R^*; \text{ there exists a prime divisor } z \text{ of zero such that } z \subset q \text{ and height } q/z = 1 < \text{height } q\}$  is empty. Thus there exists  $n$  (depending on  $b$ ) such that  $(bR^*)^{(n)} \subseteq bR^*$  2.3. Therefore  $(bR)^{(n)} \subseteq (bR^*)^{(n)} \cap R \subseteq bR^* \cap R = bR$ , so 3.4.2 holds by 3.3.2.

It is clear that 3.4.2  $\Rightarrow$  3.4.3.

Assume that 3.4.3 holds and let  $x \in \mathcal{S}(bR)$ . Then, by 3.2.3,  $x = c/b^k$ , for some  $c \in (bR)^{(k)}$ , and it may be assumed that  $k \geq n$ .

Therefore  $c \in b^k \mathcal{S}(bR) \cap R = 3.2.4 \ (bR)^{(k)} \subseteq (bR)^{(n)} \subseteq bR$ , so  $c = c_1 b$ , for some  $c_1 \in R$ . Thus  $x = c_1/b^{k-1}$ , so it follows that  $x = c'/b^{n-1}$ , for some  $c' \in R$ . Therefore  $b^{n-1} \mathcal{S}(bR) \subseteq R$ , hence  $\mathcal{S}(bR)$  is a finite  $R$ -algebra, and so 3.4.4 holds.

$R[1/b] = \bigcap \{R[1/b]_p; (0) \neq p \in \text{Spec } R[1/b]\} = \bigcap \{R_q; b \notin q \in \text{Spec } R\}$ , since altitude  $R[1/b] = 1$ , so it follows from the definitions that  $\mathcal{S}(bR) = R^{(1)}$ . Therefore 3.4.4  $\Rightarrow$  3.4.5.

Finally, assume that 3.4.5 holds. Then  $R^{(1)}$  is Noetherian and  $R^{(1)} \subseteq R' =$  the integral closure of  $R$ , hence altitude  $R^{(1)} =$  altitude  $R = 2$ . Also, each nonzero proper principal ideal is pure height one 3.2.2, and height one prime ideals in  $R^{(1)}$  contract to height one prime ideals in  $R$  3.2.1. Therefore  $R^{(1)}$  is Macaulay and height  $M' = 2$ , for each maximal ideal  $M'$  in  $R^{(1)}$  (by 3.2.1 and since maximal ideals in  $R^{(1)}$  lie over maximal ideals in  $R$ , by integral dependence). Thus  $R^{(1)}$  is an unmixed semi-local domain and is a finite  $R$ -algebra, so  $R$  is unmixed (since the completions of  $R^{(1)}$  and  $R$  have the same total quotient ring).

For future reference we note the following fact which was proved in showing 3.4.4  $\Rightarrow$  3.4.5.

REMARK 3.5. With the notation of 3.4,  $R^{(1)} = \mathcal{S}(bR)$ , for each  $0 \neq b \in M$ .

With  $(R, M)$  as in 3.4, let  $b, c$  be a system of parameters in  $R$ . Then, for some  $n \geq 1$ ,  $bR: c^n R = (bR)^{(1)}$ . (Choose  $n$  such that either  $c^n$  is in an  $M$ -primary component of  $bR$ , or  $n = 1$  if  $bR: M = bR$ .) Now, for all  $k \geq 1$ ,  $b^k, c$  is also a system of parameters. Thus for some  $n(k)$  we have  $b^k R: c^{n(k)} R = (b^k R)^{(1)} = (bR)^{(k)}$ . Here  $n(k)$  depends on  $k$ . In the following theorem it is shown that  $R$  is unmixed if and only if  $n(k)$  can be chosen independent of  $k$ .

THEOREM 3.6. *Let  $(R, M)$  be as in 3.4. Then the following statements are equivalent:*

3.6.1.  $R$  is unmixed.

3.6.2. *For each system of parameters  $b, c$  in  $R$ ,  $b^k R: c^n R = (bR)^{(k)}$ , for all  $k \geq 1$  and for all large  $n$ .*

3.6.3. *There exist a system of parameters  $b, c$  in  $R$  and  $n \geq 1$  such that  $b^k R: c^n R = (bR)^{(k)}$ , for all large  $k$ .*

*Proof.* Assume that 3.6.1 holds and let  $b, c$  be a system of parameters in  $R$ . Then there exists  $h \geq 1$  such that  $(bR)^{(k)} = b^{k-h}(bR)^{(h)}$ , for all  $k \geq h$  3.4. If  $M$  isn't a prime divisor of  $bR$ , then clearly 3.6.2 holds, so assume that  $M$  is a prime divisor of  $bR$ . For  $i = 1, \dots, h+1$ , let  $Q_i$  be a  $M$ -primary component of  $b^i R$ , and let

$n$  such that  $c^n \in \bigcap_1^{h+1} Q_i$ . Then  $b^i R: c^n R = (bR)^{(i)}$ , for  $i = 1, \dots, h$ , and  $b^{h+1} R: c^n R = (bR)^{(h+1)} = b(bR)^{(h)} \subseteq bR$ . Therefore  $b^{h+i} R: c^n R = (b^{h+i} R: c^n R) \cap bR = b(b^{h+i} R: c^n bR) = b(b^{h+i-1} R: c^n R) =$  (by induction)  $b(b^{i-1}(bR)^{(h)}) = b^i(bR)^{(h)} = (bR)^{(h+i)}$ . 3.6.2 clearly follows from this.

It is clear that  $3.6.2 \Rightarrow 3.6.3$ .

Finally, assume that 3.6.3 holds. Now there exists  $r \geq 0$  such that  $b^{r+i} R: c^n R = b^i(b^r R: c^n R)$ , for all  $i \geq 0$  [6, Ex. 3, p. 12]. Therefore, for  $i$  large,  $(bR)^{(r+i)} = b^{r+i} R: c^n R \subseteq b^i R$ , so

$$(bR)^{(r+1)} = 3.3.1 (bR)^{(r+i)}: b^{i-1} R \subseteq b^i R: b^{i-1} R = bR,$$

hence 3.6.1 holds by 3.4.

**4. Macaulay over-rings of an altitude two local domain.** In this section we first give some necessary and sufficient conditions for  $A = R[b/c]$  to be locally Macaulay and for  $A_{(M, b/c)}$  to be Macaulay where  $b, c$  is a system of parameters in an altitude two local domain  $(R, M)$  4.1, 4.5, 4.7, and 4.8. Then we use these results to characterize when  $R$  is unmixed in 4.10-4.14. Finally, we show in 4.15 that such characterizations can be used to obtain information on when local domains of altitude  $> 2$  are unmixed.

We begin with the following result.

**PROPOSITION 4.1.** *Let  $b, c$  be a system of parameters in a local domain  $(R, M)$  such that altitude  $R = 2$ . Then  $A = R[b/c]$  is locally Macaulay if and only if  $cA$  is  $MA$ -primary.*

*Proof.*  $MA$  is a height one depth one prime ideal [9, Lemma 4.3], so  $MA$  is a prime divisor of  $cA$ . Assume  $cA$  isn't  $MA$ -primary, and let  $p \neq MA$  be a prime divisor of  $cA$ . Then  $(b, c)R \subseteq p \cap R$ , so  $p \cap R = M$ , and so  $MA \subseteq p$ , hence  $p$  is an imbedded prime divisor of  $cA$ .

Now, if  $A$  is locally Macaulay, then, in particular,  $A_N$  is Macaulay, for all prime ideals  $N$  in  $A$  such that  $MA \subset N$ . Therefore  $N$  isn't a prime divisor of  $cA$ , so  $cA$  is  $MA$ -primary (by the preceding paragraph).

Conversely, if  $cA$  is  $MA$ -primary, then, for each height two maximal ideal  $N$  in  $A$ ,  $MA \subset N$  and  $cA_N$  is  $MA_N$ -primary, so  $A_N$  is Macaulay. It readily follows from this that  $A$  is locally Macaulay, since altitude  $A = 2$ .

The following remark gives some information related to 4.1.

REMARK 4.2. Let the notation be as in 4.1, and let  $x = b/c$ . Then the following statements hold:

4.2.1.  $\text{Rad } cA = MA$ , even if  $A$  isn't locally Macaulay.

4.2.2.  $A_N$  is Macaulay, for all but a finite number of maximal ideals  $N$  in  $A$ .

4.2.3.  $A_{(M, x)A}$  is Macaulay if and only if  $xA$  is pure height one.

*Proof.* 4.2.1 was proved in the first paragraph of the proof of 4.1.

4.2.2. If  $A_N$  isn't Macaulay, then  $\text{height } N = 2$  (so  $MA \subset N$ ) and  $NA_N$  is a prime divisor of the nonzero principal ideals contained in  $NA_N$ , hence  $N$  is a prime divisor of  $cA$ . The conclusion follows, since  $cA$  has only finitely many prime divisors.

4.2.3.  $A/xA = R/(xA \cap R)$  is a local ring, so every prime divisor of  $xA$  is contained in  $N = (M, x)A$ . Also,  $A_N$  is Macaulay if and only if  $xA_N$  is pure height one, so  $A_N$  is Macaulay if and only if  $xA$  is pure height one.

To derive some further information on when  $A_{(M, b/c)}$  is Macaulay, the following definitions and lemma are needed.

DEFINITION 4.3. Let  $I$  be an ideal in a Noetherian domain  $A$ , and let  $b \in I$ . Then  $b$  is *superficial* for  $I$  in case  $I^{n+1}:bA = I^n$ , for all large  $n$ .  $b$  is *strongly superficial* for  $I$  in case  $I^{n+1}:bA = I^n$ , for all  $n \geq 1$ .

By [6, 3.12], this definition of superficial element is equivalent to the usual definition (see [6, p. 72] or [17, p. 285]).

Strongly superficial elements were defined and studied in [16].

The following lemma will be useful in what follows. I am indebted to the referee for suggesting 4.4.2 and for simplifying my original proofs of 4.5 and 4.7.

LEMMA 4.4. Let  $b, c$  be nonunits in a Noetherian domain  $A$ . Then the following statements hold:

4.4.1.  $b$  is *superficial* (respectively, *strongly superficial*) for  $(b, c)A$  if and only if  $c^{n+1}A:bA \subseteq (b, c)^nA$ , for all large  $n$  (respectively, for all  $n \geq 1$ ).

4.4.2.  $b$  is *superficial* (respectively, *strongly superficial*) for  $(b, c)A$  if and only if  $b(b, c)^nA:c^{n+1}A = bA:c^{n+1}A$ , for all large  $n$  (respectively, for all  $n \geq 1$ ).

*Proof.*  $(b, c)^{n+1}A:bA = (c^{n+1}, b(b, c)^n)A:bA = (c^{n+1}A:bA, (b, c)^nA)$ . Both conclusions in 4.4.1 readily follow from this.

To prove 4.4.2, fix  $n \geq 1$ . Then it suffices to show that  $(b, c)^{n+1}A: bA = (b, c)^nA$  if and only if  $b(b, c)^nA: c^{n+1}A = bA: c^{n+1}A$ , and the proof of this is straightforward.

**PROPOSITION 4.5.** *Let the notation be as in 4.1. Then  $b$  is superficial for  $(b, c)R$  if and only if  $D = A_{(M, b/c)}$  is Macaulay.*

*Proof.* Let  $x = b/c$ , and let  $I_n = b(b, c)^nR: c^{n+1}R$ , so  $I_n \subseteq I_{n+1}$  and a straightforward computation shows that  $xI_n \cap R = I_n$ , for all large  $n$ . Now,  $b$  is superficial for  $(b, c)A$  if and only if  $I_n = bA: c^{n+1}A$ , for all large  $n$  4.4.2, if and only if  $I_n = (bR)^{(1)}$ , for all large  $n$ , if and only if  $I_n$  is pure height one, for all large  $n$ , if and only if  $xI_n \cap R$  is pure height one if and only if  $xI_n$  is pure height one (since  $A/xA = R/(xA \cap R)$ ) if and only if  $D$  is Macaulay.

It is known that if  $R/M$  is infinite, then there exists a superficial element, say  $d$ , for  $(b, c)R$  [17, Remark 2, p. 287]. Then it is easily seen that  $d \notin (b, c)M$ , so either  $(b, c)R = (d, b)R$  or  $(b, c)R = (d, c)R$ , hence either  $R[d/b]_{(M, d/b)}$  or  $R[d/c]_{(M, d/c)}$  is Macaulay, by 4.5.

Also, it is known [7, Corollary 2.2 and Lemma 2.1] that if  $R$  is Macaulay and  $b, c$  is a system of parameters in  $R$ , then  $D = R[b/c]_{(M, b/c)}$  is Macaulay and  $K = \text{Ker}(R[X] \rightarrow R[b/c]) = (cX - b)R[X]$ . It will be seen in 4.7 that a weaker condition than being a  $R$ -sequence implies that  $D$  is Macaulay and  $K$  has a similar set of generators, even if  $R$  is not Macaulay. For this we need the following definition.

**DEFINITION 4.6.** Let  $b, c$  be nonzero elements in an integral domain  $A$ . Then  $K = \text{Ker}(R[X] \rightarrow R[b/c])$  has a *linear base* in case  $K$  is generated by  $\{eX - d; be = cd\}$ .

A number of results on linear bases are given in [11].

**PROPOSITION 4.7.** *With the notation of 4.1, if  $bR: cR = (bR)^{(1)}$ , then  $b$  is strongly superficial for  $(b, c)R$  and  $K$  has a linear base. Therefore  $R[b/c]_{(M, b/c)}$  is Macaulay.*

*Proof.* If  $bR: cR = (bR)^{(1)}$ , then clearly  $bR: cR = bR: c^nR$ , for all  $n \geq 1$ , so  $K$  has a linear base [11, Corollary 7]. To see that  $b$  is strongly superficial for  $(b, c)R$ , let  $r \in c^{n+1}R: bR$ , so  $rb = c^{n+1}s$ , for some  $s \in R$ . Then  $s \in bR: c^{n+1}R = bR: cR$ , so there exists  $t \in R$  such that  $rb = sc^{n+1} = tbc^n$ . Therefore  $r \in c^nR \subseteq (b, c)^nR$ , hence  $b$  is strongly superficial for  $(b, c)R$  4.4.1. The last statement follows from this and 4.5.

It can be shown that the following statements are equivalent:

(i)  $b$  is strongly superficial for  $(b, c)R$  and  $K$  has a linear base; (ii)  $b$

is superficial for  $(b, c)R$  and  $K$  has a linear base; (iii)  $c^2R: bR = c(cR: bR)$ ; and, (iv)  $bR: cR = (bR)^{(u)}$ . (The proof is fairly straightforward (using 4.7), so will be omitted.)

One further result on Macaulay over-rings of  $R$  will be given. Namely, we will characterize when  $R[b/c]$  and  $R[c/b]$  are simultaneously locally Macaulay. For this, recall that if  $I$  is an ideal in a ring  $A$ , then the Rees ring  $\mathcal{R} = \mathcal{R}(A, I)$  of  $A$  with respect to  $I$  is the graded subring  $\mathcal{R} = A[tI, u]$  of  $A[t, u]$ , where  $t$  is an indeterminate and  $u = 1/t$ .

**PROPOSITION 4.8.** *With the notation of 4.1, the following statements are equivalent:*

- 4.8.1.  $u\mathcal{R}(R, (b, c)R)$  has no height two prime divisors.
- 4.8.2. For each  $0 \neq d \in (b, c)R$ ,  $R[b/d, c/d]$  is locally Macaulay.
- 4.8.3.  $R[b/c]$  and  $R[c/b]$  are locally Macaulay.

*Proof.* Assume that 4.8.1 holds and let  $0 \neq d \in (b, c)R$ . Let  $A = R[b/d, c/d]$ , and let  $\mathcal{S} = A[td, 1/td]$ , so  $\mathcal{S} = \mathcal{R}[1/td]$ , where  $\mathcal{R} = \mathcal{R}(R, (b, c)R)$ . Also,  $\mathcal{S}$  is a quotient ring of a transcendental extension ring of  $A$ , and  $d\mathcal{S} = u\mathcal{S}$ . Let  $P$  be a prime ideal in  $A$ . If  $\text{height } P = 1$ , then clearly  $A_P$  is Macaulay, so assume that  $\text{height } P = 2$  (note that  $\text{altitude } A \leq 2$ ). Then  $M = P \cap R$ , so  $d \in P$ . Let  $P^* = P\mathcal{S} \cap \mathcal{R}$ . Then  $\text{height } P^* = 2$  and  $u \in P^*$ , so  $P^*$  isn't a prime divisor of  $u\mathcal{R}$  (by hypothesis), and so  $P^*\mathcal{S}$  isn't a prime divisor of  $u\mathcal{S} = d\mathcal{S}$ , whence  $P$  isn't a prime divisor of  $dA$ , and hence  $A_P$  is Macaulay.

It is clear that  $4.8.2 \Rightarrow 4.8.3$ .

Finally, assume that 4.8.3 holds, and suppose that  $Q$  is a height two prime divisor of  $u\mathcal{R}$ . Then either  $tb$  or  $tc$  isn't in  $Q$ , for otherwise  $b = utb$  and  $c = utc$  are in  $Q$  so  $Q \cap R$  is  $M$ -primary (since  $\text{height } (b, c)R = 2$ ), hence  $(u, M, tb, tc)\mathcal{R} \subseteq Q$ , and so  $\text{height } Q = 3$  [9, Remark 3.7]. Say  $tc \notin Q$ . Then  $P = Q\mathcal{R}[1/tc] \cap R[b/c]$  is a height two prime ideal which is a prime divisor of  $cR[b/c]$  (much as in the first paragraph of this proof), so  $R[b/c]_P$  isn't Macaulay; contradiction. Therefore  $u\mathcal{R}$  has no height two prime divisors, so 4.8.1 holds.

We now return to the consideration of unmixed local domains.

**PROPOSITION 4.9.** *Let  $(R, M)$  be an unmixed local domain such that  $\text{altitude } R = 2$ , and let  $b, c$  be a system of parameters in  $R$ . Then, for each prime ideal  $P$  in  $A = R[b/c]$  such that  $MA \subseteq P$ ,  $R$  is a subspace of  $A_P$ .*

*Proof.* This is a special case of [9, 4.1(2)].

Using 4.9 and the preceding results on Macaulay over-rings of  $R$ , we can now prove a number of characterizations of when  $R$  is unmixed.

**COROLLARY 4.10.** *With the notation of 4.1, let  $P$  be a prime ideal in  $A$  such that  $MA \subseteq P$  and  $A_P$  is Macaulay. Then  $R$  is a subspace of  $A_P$  if and only if  $R$  is unmixed.*

*Proof.* If  $R$  is a subspace of  $A_P$ , then  $R$  is unmixed by [9, Lemma 4.5(2)]. The converse follows from 4.9.

**COROLLARY 4.11.** *With the notation of 4.1, assume that  $cA$  is  $MA$ -primary. Then there exists a prime ideal  $P$  in  $A$  such that  $MA \subseteq P$  and  $R$  is a subspace of  $A_P$  if and only if  $R$  is unmixed.*

*Proof.*  $A$  is locally Macaulay 4.1, so the conclusion follows from 4.10.

**COROLLARY 4.12.** *With the notation of 4.1, assume that  $b$  is superficial for  $(b, c)R$ . Then  $R$  is unmixed if and only if  $R$  is a subspace of  $D = A_{(M, b/c)}$ .*

*Proof.* By 4.5,  $D$  is Macaulay, so the conclusion follows from 4.10.

**COROLLARY 4.13.** *With the notation of 4.1, assume that  $bA : cA = (bA)^{(1)}$ . Then  $R$  is unmixed if and only if  $R$  is a subspace of  $D = A_{(M, b/c)}$ .*

*Proof.* By 4.7,  $b$  is superficial for  $(b, c)R$ , so the conclusion follows from 4.12.

**COROLLARY 4.14.** *With the notation of 4.1, assume that  $u\mathcal{R}(R, (b, c)R)$  has no height two prime divisors. Then  $R$  is unmixed if and only if there exist  $d \in (b, c)R$  and a prime ideal  $P$  in  $B = R[b/d, c/d]$  such that  $MB \subseteq P$  and  $R$  is a subspace of  $B_P$ .*

*Proof.*  $B$  is locally Macaulay 4.8, so the conclusion follows from 4.10.

This section will be closed with the following remark which shows how the above results can be used to obtain information on when local domains of altitude  $> 2$  are unmixed.

**REMARK 4.15.** Let  $(L, N)$  be a local domain such that altitude

$L = n + 1 > 2$ , and let  $x, y_1, \dots, y_n$  be a system of parameters in  $L$ . Let  $B = L[y_1/x, \dots, y_n/x]$ , and let  $P = (MB, y_1/x)B$ . Then  $(R, M) = (B_P, PB_P)$  is a local domain of altitude two [9, Lemma 4.3]. Now, if  $L$  is a subspace of  $R$ , then  $L$  is unmixed if and only if  $R$  is unmixed [9, Lemma 4.5(2)]. Therefore, assuming that  $L$  is a subspace of  $R$ ,  $L$  is unmixed if and only if  $L$  is a subspace of some Macaulay local domain of the form  $A_P$ , where  $b, c$  is a system of parameters in  $R$  and  $P$  is a prime ideal in  $A = R[b/c]$  such that  $MA \subseteq P$ .

*Proof.* This follows from [9, Lemma 4.5(2)] and 4.10.

Also, in 4.15 and assuming that  $L$  is a subspace of  $R$ ,  $L$  is unmixed if and only if  $R^{(1)}$  is a finite  $R$ -algebra, by [9, Lemma 4.5(2)] and 3.4.

5. Relationships between  $R$ ,  $R^{(1)}$ , and  $R'$ . In this section we consider what containment relationships are possible between  $R$ ,  $R^{(1)}$ , and  $R'$ , and what these imply concerning quasi-unmixedness, where  $R$  is a local domain of altitude two and  $R'$  is the integral closure of  $R$ . 5.1 gives the main results, and 5.2 gives some supplemental information and some examples. Much of these two results is a compilation of known results.

**THEOREM 5.1.** *Let  $(R, M)$  be a local domain such that altitude  $R = 2$ , and let  $R'$  be the integral closure of  $R$ . Let  $\mathcal{P} = \{p \in \text{Spec } R; \text{ height } p = 1\}$ , so  $R^{(1)} = \bigcap \{R_p; p \in \mathcal{P}\}$ . Then the following statements hold:*

5.1.1.  $R^{(1)} \supset R'$  if and only if  $R_p$  is integrally closed, for all  $p \in \mathcal{P}$ , and there exists a height one maximal ideal in  $R'$ .

5.1.2.  $R^{(1)} = R'$  if and only if  $R_p$  is integrally closed, for all  $p \in \mathcal{P}$ , and  $R$  is quasi-unmixed.

5.1.3.  $R^{(1)} \subseteq R'$  if and only if  $R$  is quasi-unmixed.

5.1.4.  $R^{(1)}$  is a finite  $R$ -algebra if and only if  $R$  is unmixed.

5.1.5.  $R^{(1)} = R$  if and only if  $R$  is Macaulay.

*Proof.* Let  $\mathcal{P}' = \{p' \in \text{Spec } R'; \text{ height } p' = 1\}$ .

5.1.1.  $R' \subseteq R^{(1)}$  if and only if  $R' \subseteq P_p$ , for all  $p \in \mathcal{P}$ , if and only if  $R_p = R'_{(R-p)}$  is integrally closed, for all  $p \in \mathcal{P}$ , if and only if (by integral dependence)  $R^{(1)} = \bigcap \{R'_p; p' \in \mathcal{P}''\}$ , where  $\mathcal{P}'' = \{p' \in \mathcal{P}'; p' \text{ isn't maximal}\}$ . Also, there exists a height one maximal ideal in  $R'$  if and only if  $\mathcal{P}'' \subset \mathcal{P}'$  if and only if  $R' = [6, (2. b), p. 116] \cap \{R'_p; p' \in \mathcal{P}'\} \subset \bigcap \{R'_p; p' \in \mathcal{P}''\}$ . 5.1.1 readily follows from this.

5.1.2. By 5.1.1,  $R' = R^{(1)}$  if and only if  $R_p$  is integrally closed,

for all  $p \in \mathcal{P}$ , and there does not exist a height one maximal ideal in  $R'$ . 5.1.2 follows from this and the fact that there does not exist a height one maximal ideal in  $R'$  if and only if  $R$  is quasi-unmixed, by [8, Corollary 3.4(i)].

5.1.3.  $R$  is quasi-unmixed if and only if there does not exist a height one maximal ideal in  $R'$  [8, Corollary 3.4(i)] if and only if, for each  $p' \in \mathcal{P}'$ ,  $p' \cap R \in \mathcal{P}$  if and only if  $R^{(1)} = (\text{by the Lying Over Theorem}) \cap \{R_{p' \cap R}; p' \in \mathcal{P}'\} \subseteq \bigcap \{R_{p'}; p' \in \mathcal{P}'\} = R'$ .

5.1.4. is given by 3.4.

5.1.5.  $R$  is Macaulay if and only if, for each  $0 \neq b \in M$ ,  $bR$  is pure height one if and only if  $R = R^{(1)}$  [10, Theorem 2.17].

REMARK 5.2. With the notation of 5.1 the following statements hold:

5.2.1.  $R^{(1)} \subset R'$  if and only if  $R$  is quasi-unmixed and  $R_p$  isn't integrally closed, for some  $p \in \mathcal{P}$ .

5.2.2.  $R$  is quasi-unmixed if and only if height  $M' = 2$ , for all maximal ideals  $M'$  in  $R'$ .

5.2.3. If  $R' = R$ , then  $R$  is Macaulay and  $R = R^{(1)}$ .

5.2.4. If  $R^{(1)}$  is a finite  $R$ -algebra (so  $R^{(1)} \subseteq R'$ ), then either  $R^{(1)} = R$  or the conductor  $R:R^{(1)}$  of  $R$  in  $R^{(1)}$  is  $M$ -primary.

5.2.5. If  $R'$  is a finite  $R^{(1)}$ -algebra, then either  $R^{(1)} = R'$  or height  $R^{(1)}:R' = 1$ .

5.2.6. If  $R$  is as in [2, Proposition 3.3], then  $R^{(1)} = R'$  and  $R^{(1)}$  isn't a finite  $R$ -algebra. (Therefore  $R$  is quasi-unmixed and isn't unmixed.)

5.2.7. If  $R$  is as in [6, Example 2, pp. 203-205] in the case  $m = 0$ , then  $R^{(1)} \supset R'$ .

5.2.8. If  $k$  is a field and  $R = A_p$ , where

$$A = k[X^2 - X, X^3 - X^2, Y, XY]$$

and  $P = (X^2 - X, X^3 - X^2, Y, XY)A$ , then  $R^{(1)} = R' \supset R$  and  $R^{(1)}$  is a finite  $R$ -algebra.

5.2.9. There exists  $x \in R'$  such that  $R^{(1)} \subseteq R'[1/x] = (\text{say}) D'$ ,  $D'$  is the integral closure of  $D = R[x, 1/x]$ ,  $D$  is a local domain,  $D^{(1)}$  is a finite  $R^{(1)}$ -algebra, and the maximal ideals in  $D'$  are the ideals  $M'D'$ , where  $M'$  is a height two maximal ideal in  $R'$ .

5.2.10.  $R^{(1)}$  is Noetherian and is the smallest Macaulay domain  $D$  such that:  $R \subseteq D$ , the integral closure  $D'$  of  $D$  is  $R'[1/x]$ , for some  $x \in R'$ , and all maximal ideals in  $D$  have height two.

*Proof.* 5.2.1 is clear by 5.1.2 and 5.1.3.

5.2.2 follows from [8, Proposition 3.5].

5.2.3 holds, since an integrally closed local domain of altitude

two is Macaulay.

5.2.4. Assume  $(0) \neq R:R^{(1)} \neq R$ , and let  $0 \neq b \in M$ . Then  $\mathcal{S}(bR) = (3.5)R^{(1)}$  is a finite  $R$ -algebra, so  $b^n \mathcal{S}(bR) \subseteq R$ , for some  $n \geq 1$ . Therefore, since  $M$  is finitely generated,  $M^k R^{(1)} \subseteq R$ , for some  $k \geq 1$ , so  $M^k \subseteq R:R^{(1)} \neq R$ , hence  $R:R^{(1)}$  is  $M$ -primary.

5.2.5. If  $(0) \neq R^{(1)}:R' \neq R'$ , then  $R^{(1)} \subset R'$ , so there exists a height one prime ideal  $p$  in  $R$  such that  $R' \not\subseteq R_p$ , hence  $p^* = pR_p \cap R^{(1)}$  is a height one prime ideal such that  $R' \not\subseteq R_p^{(1)}$ . Therefore

$$(0) \neq R^{(1)}:R' \subseteq p^*,$$

hence height  $R^{(1)}:R' = 1$ .

5.2.6 and 5.2.7 are given in the cited references. (The parenthetical statement in 5.2.6 follows from 5.1.3 and 5.1.4.)

5.2.8. The integral closure of  $R$  is  $R' = k[X, Y]_{(X, Y) \cap (X-1, Y)}$  which is a regular domain with two maximal ideals, altitude  $R = \text{altitude } R' = 2$ , and  $R' = R[X]$  is a finite  $R$ -algebra. Also, it is readily seen that, for each height one prime ideal  $p$  in  $R$ , either  $X$  or  $1/X$  is in  $R_p$ , and so in either case  $X \in R_p$  (since  $X \in R'$  and  $1/X \in R_p$  imply  $X \in R_p$ ). Therefore  $R^{(1)} \supseteq R'$ . Also,  $R$  is quasi-unmixed, since  $R$  is a locality over a field, so  $R^{(1)} = R'$  is a finite  $R$ -algebra 5.1.2.

5.2.9. If  $R'$  has no height one maximal ideals, then  $R^{(1)} \subseteq R'$ , by 5.1.3 and 5.2.2, so let  $x = 1$ . If  $R'$  has height one maximal ideals, then, since  $R'$  has only finitely many maximal ideals, let  $x$  in all height one maximal ideals in  $R'$  such that  $x - 1$  is in all height two maximal ideals. Then  $R'[1/x]$  is the integral closure of  $D = R[x, 1/x]$  and  $D$  is a local domain of altitude two (since  $R[x]$  has exactly two maximal ideals, say  $N$  and  $N'$ , height  $N = 1$ , height  $N' = 2$ ,  $x \in N$ , and  $x \notin N'$ ). Let  $C = R + (N \cap N')$ , so  $R \subseteq C \subseteq R[x]$ . Also,  $C$  is a local domain which is a finite  $R$ -algebra, so  $C^{(1)}$  is a finite  $R^{(1)}$ -algebra (since height one prime ideals in  $C$  contract to height one prime ideals in  $R$  and, if  $d \in R:C$ , then  $d \in R^{(1)}:C^{(1)}$ ). Finally,  $D^{(1)} = C^{(1)}$  [13, 4.2], and the maximal ideals in  $D'$  are as described.

5.2.10.  $R^{(1)}$  is Noetherian (by [2, Corollary 1.4]), every maximal ideal in the integral closure  $R'[1/x]$  of  $R^{(1)}$  has height two (by 5.2.9) (so every maximal ideal in  $R^{(1)}$  has height two), and  $bR^{(1)}$  is pure height one, for all nonzero nonunits  $b \in R^{(1)}$  [3, 5.10.17(i)], so  $R^{(1)}$  is Macaulay. Now let  $D$  be a Macaulay domain such that  $R \subseteq D \subseteq D' = R'[1/x]$ , for some  $x \in R'$ , and such that all maximal ideals in  $D$  have height two. Let  $p$  be a height one prime ideal in  $D$ . Then there exists a height one prime ideal  $p''$  in  $D' = R'[1/x]$  such that  $p'' \cap D = p$  and  $p''$  isn't maximal. Therefore  $p' = p'' \cap R'$  is a height one non-maximal prime ideal, so  $q = p' \cap R$  is a height one prime ideal. Therefore  $R_q \subseteq D_p$ , hence  $R^{(1)} \subseteq D^{(1)} = D$ .

In particular, by 5.2.10 and 5.1.3, if  $R$  is quasi-unmixed, then  $R^{(1)}$  is the smallest Macaulay domain  $D$  such that  $R \subseteq D \subseteq R'$ .

**6. Some characterizations of arbitrary unmixed local domains.** In this Section 6.1 gives a sufficient condition for a semi-local ring to be unmixed. Then 6.3–6.9 give some characterizations of unmixed local domains.

**THEOREM 6.1.** *Let  $R$  be a semi-local ring, and assume there exists a regular element  $b$  in the Jacobson radical of  $R$  such that  $R/bR$  is unmixed. Then  $R$  is unmixed.*

*Proof.* Let  $\mathcal{P}$  be the set of prime divisors of  $bR^*$ , where  $R^*$  is the completion of  $R$ . Then, by hypothesis, each  $p \in \mathcal{P}$  is such that  $\text{depth } p = \text{depth } bR^* = \text{altitude } R - 1$ . Also,  $bR^* = \bigcap \{bR_p^* \cap R^*; p \in \mathcal{P}\} \supseteq \bigcap \{(0)R_p^* \cap R^*; p \in \mathcal{P}\} = (\text{say}) N$ . Then  $N:bR = N$ , since  $b$  is a regular element in  $R^*$ , so  $N = (0)$  [6, 4.3]. Therefore it follows that if  $z$  is a prime divisor of  $(0)$  in  $R^*$ , then there exists  $p \in \mathcal{P}$  such that  $z \subset p$ . Then  $\text{depth } z \geq \text{depth } p + 1 = \text{altitude } R$ , so  $R$  is unmixed.

It is an open problem whether every quasi-unmixed local  $UFD$   $R$  is unmixed. (Note that if either  $R$  is Macaulay or the completion of  $R$  is a  $UFD$ , then  $R$  is unmixed, but it is known that there exist local  $UFD$ 's which aren't Macaulay and whose completions aren't  $UFD$ 's.) Using 6.1, the following remark shows that if one such ring isn't unmixed, then many other examples (besides the one given in [1, Proposition 3.3]) of quasi-unmixed and not unmixed local domains exist.

**REMARK 6.2.** Let  $R$  be a local domain such that  $\text{altitude } R = a \geq 3$ ,  $R$  is quasi-unmixed, and  $R$  is a  $UFD$ . If  $R$  isn't unmixed, then, for all height one prime ideals  $\pi R$  in  $R$ ,  $R/\pi R$  is a local domain,  $\text{altitude } R/\pi R = a - 1$ ,  $R/\pi R$  is quasi-unmixed [6, 34.5], and  $R/\pi R$  isn't unmixed 6.1.

It has recently been shown that if  $R$  is an unmixed local domain, then, for all but finitely many height one prime ideals  $p$  in  $R$ ,  $R/p$  is unmixed [1, 5.9] or [12, Remark 3.2(2)] together with [6, 18.11]. Using this, we have the following result which is related to 6.1.

**THEOREM 6.3.** *Let  $(R, M)$  be a local domain, not a field. Then  $R$  is unmixed if and only if there exists  $0 \neq b \in M$  such that  $\mathcal{T}(bR)$  is a finite  $R$ -algebra and  $\mathcal{T}/b\mathcal{T}$  is unmixed.*

*Proof.* If  $R$  is unmixed, then  $R^{(1)}$  is a finite  $R$ -algebra [9, Lemma 5.11], so, for all  $0 \neq b \in M$ ,  $\mathcal{T}(bR)$  is a finite  $R$ -algebra. Also, there exists a finite (possibly empty) set  $\mathcal{P}$  of height one prime ideals  $p'$  in  $R$  such that  $R/p'$  isn't unmixed [1, 5.9] or [12, Remark 3.2(2)] together with [6, 18.11]. Let  $0 \neq b \in M$  such that  $b \notin \bigcup \{p'; p' \in \mathcal{P}\}$ . (Since  $R$  isn't a field, such  $b$  exist.) Then  $\mathcal{T} = \mathcal{T}(bR)$  is a finite  $R$ -algebra,  $b\mathcal{T}$  is pure height one 3.2.6, and there exists a one-to-one correspondence between the prime divisors  $q$  of  $b\mathcal{T}$  and the height one prime divisors  $p$  of  $bR$  such that  $R_p = \mathcal{T}_q$  3.2.1. Therefore, for each prime divisor  $q$  of  $b\mathcal{T}$  (and with  $p = q \cap R$ ),  $\mathcal{T}/q$  is unmixed (since  $R/p$  is and  $\mathcal{T}/q$  is a finite  $R/p$ -algebra with the same integral closure). Also,  $\text{depth } q = \text{altitude } R - 1$ , since  $R$  is catenary [6, 34.6] and  $\text{height } p = 1$ . Therefore  $\mathcal{T}/b\mathcal{T}$  is unmixed, since a semi-local ring  $\mathcal{T}$  is mixed if and only if  $\mathcal{T}/z$  is unmixed and  $\text{depth } z = \text{altitude } \mathcal{T}$ , for all prime divisors  $z$  of zero in  $\mathcal{T}$ .

Conversely,  $\mathcal{T} = \mathcal{T}(bR)$  is unmixed 6.1, so  $R$  is unmixed, since, by hypothesis, the completions of  $R$  and  $\mathcal{T}$  have the same total quotient ring.

**COROLLARY 6.4.** *Let  $(R, M)$  be as in 6.3. Then  $R$  is unmixed if and only if there exists  $0 \neq b \in M$  such that  $\mathcal{T}(bR)$  is a finite  $R$ -algebra and, for each minimal prime divisor  $p$  of  $bR$ ,  $\text{depth } p = \text{altitude } R - 1$  and  $R/p$  is unmixed.*

*Proof.* If  $R$  is unmixed, then there exists  $0 \neq b \in M$  such that  $\mathcal{T} = \mathcal{T}(bR)$  is a finite  $R$ -algebra and  $\mathcal{T}/b\mathcal{T}$  is unmixed 6.3. Therefore, by the one-to-one correspondence between the prime divisors  $q$  of  $b\mathcal{T}$  and the height one prime divisors  $p$  of  $bR$  3.2.1, for each minimal prime divisor  $p$  of  $bR$ ,  $\text{depth } p = \text{altitude } R - 1$  and  $R/p$  is unmixed (since  $\mathcal{T}/q$  is a finite  $R/p$ -algebra with the same integral closure).

Conversely, it suffices to prove that  $\mathcal{T} = \mathcal{T}(bR)$  is such that  $\mathcal{T}/b\mathcal{T}$  is unmixed, by 6.3. But this follows from the hypothesis and the one-to-one correspondence mentioned above, since  $b\mathcal{T}$  is pure height one 3.2.6.

**REMARK 6.5.** The proofs of 6.3 and 6.4 show that if  $R$  is unmixed, then for each  $b \in M$ ,  $\notin \bigcup \{q \in \text{Spec } R; \text{height } q = 1 \text{ and } R/q \text{ isn't unmixed}\}$  (which is a finite set [1, 5.9],  $\mathcal{T} = \mathcal{T}(bR)$  is a finite  $R$ -algebra and  $\mathcal{T}/b\mathcal{T}$  is unmixed (in (6.3) and  $R/p$  is unmixed, for all minimal prime divisors  $p$  of  $bR$  (in 6.4)).

There is a somewhat analogous characterization of a quasi-unmixed local domain, as will now be shown. The author doesn't

know if the quantifier in the condition in 6.6 can be replaced by "there exists." (However, if it is assumed that  $R/p$  is unmixed (rather than quasi-unmixed), for all height one prime ideals  $p$  in  $R$ , then this replacement can be made.)

**PROPOSITION 6.6.** *Let  $(R, M)$  be a local domain. Then  $R$  is quasi-unmixed if and only if, for all  $0 \neq b \in M$ ,  $\mathcal{I}(bR) \subseteq R'$  (=the integral closure of  $R$ ) and, for each height one prime divisor  $p$  of  $bR$ ,  $\text{depth } p = \text{altitude } R - 1$  and  $R/p$  is quasi-unmixed.*

*Proof.* If  $R$  is quasi-unmixed, then  $R^{(1)} \subseteq R'$  [9, Theorem 5.4], so, for all  $0 \neq b \in M$ ,  $\mathcal{I}(bR) \subseteq R'$ . Also, for each height one prime ideal  $p$  in  $R$ ,  $\text{depth } p = \text{altitude } R - 1$  and  $R/p$  is quasi-unmixed [6, 34.5].

For the converse, it may clearly be assumed that  $\text{altitude } R > 1$ . Let  $z$  be a minimal prime ideal in the completion  $R^*$  of  $R$ . Then, since  $\mathcal{I}(bR) \subseteq R'$ , for each  $0 \neq b \in M$ , there are no height one maximal ideals in  $R'$  [15, Corollary 2.13], so  $\text{depth } z > 1$  [8, Proposition 3.5]. Also, there are at most a finite number of prime ideals  $q$  in  $R^*$  such that  $z \subset q$  and  $\text{height } q/z = 1 < \text{height } q$  [4, Theorem 1]. Let  $\mathcal{S}$  be this set of prime ideals, so  $MR^* \notin \mathcal{S}$ . Therefore let  $0 \neq b \in M$  such that  $b \notin \bigcup \{q \cap R; q \in \mathcal{S}\}$ . Then there exists a prime ideal  $p^*$  in  $R^*$  such that  $(z, b)R^* \subseteq p^*$  and  $\text{height } p^*/z = 1$ , so  $\text{height } p^* = 1$  (by the choice of  $b$ ). Therefore  $p^*$  is a minimal prime divisor of  $bR^*$ , so  $p^*$  is a minimal prime divisor of  $pR^*$ , where  $p = p^* \cap R$ . Then  $\text{height } p = 1$ , so by hypothesis,  $\text{depth } p^* = \text{depth } p = \text{altitude } R - 1$ , hence  $\text{depth } z = \text{altitude } R$ , so  $R$  is quasi-unmixed.

It is known [9, Theorem 5.3] that for a local domain  $R$ ,  $R$  is catenary and  $(R/p)^{(1)}$  is a finite  $R/p$ -algebra, for all  $p \in \text{Spec } R$  if and only if  $R/p$  is unmixed, for all  $p \in \text{Spec } R$ . The following result shows that a weaker condition than that in [9, Theorem 5.3] implies that  $R/p$  is unmixed, for all  $p \in \text{Spec } R$ .

**THEOREM 6.7.** *Let  $(R, M)$  be a local domain. Then, for all  $p \in \text{Spec } R$ ,  $R/p$  is unmixed if and only if the following condition holds:  $R$  is catenary and, for all non-maximal  $p \in \text{Spec } R$ , there exists  $0 \neq b + p \in M/p$  such that  $\mathcal{I}((b + p)(R/p))$  is a finite  $R/p$ -algebra.*

*Proof.* Assume first that the condition holds. The proof that each  $R/p$  is unmixed is by induction on  $n = \text{altitude } R$ , and it may clearly be assumed that  $n > 1$ . Also, the condition is inherited by

each  $R/p$ , so it suffices to prove that  $R$  is unmixed. For this, with  $b$  as in the condition for  $p = (0)$ ,  $\mathcal{S}(bR)$  is a finite  $R$ -algebra. Also, for each minimal prime divisor  $p$  of  $bR$ ,  $R/p$  is unmixed (by induction). Therefore, since  $R$  is catenary,  $R$  is unmixed 6.4.

The converse follows immediately from [9, Theorem 5.3], since  $\mathcal{S}((b + p)(R/p)) \subseteq (R/p)^{(1)}$ .

The following result shows that a somewhat analogous condition to that in 6.7 characterizes when  $R$  is unmixed.

**THEOREM 6.8.** *Let  $(R, M)$  be a local ring such that  $n = \text{altitude } R > 0$  and all prime divisors of zero are minimal. Then  $R$  is unmixed if and only if  $R$  satisfies the first chain condition (f.c.c.) and there exists a system of parameters (s.o.p.)  $x_1, \dots, x_n$  in  $R$  such that the following condition holds for  $i = 0, 1, \dots, n - 2$ : if  $q$  is a minimal prime divisor of  $(x_1, \dots, x_i)R$ , then  $\mathcal{S}((x_{i+1} + q)(R/q))$  is a finite  $R/q$ -algebra. (For  $i = 0$ ,  $q$  is a minimal prime divisor of zero.) Moreover, if  $R$  is unmixed, then, for each  $q \in \mathcal{P} = \{q \in \text{Spec } R; q \text{ is a minimal prime divisor of } (x_1, \dots, x_i)R, \text{ for some } i = 0, 1, \dots, n\}$ ,  $R/q$  is unmixed.*

*Proof.* Assume first that  $R$  is unmixed, so  $R$  satisfies the f.c.c. [6, 34.6]. Let  $z_1, \dots, z_g$  be the (minimal) prime divisors of zero in  $R$ . The existence of  $x_1, \dots, x_n$  will be shown by induction on  $n$ . If  $n = 1$ , then there is nothing to prove, so assume that  $n > 1$  and the result holds for local rings of altitude  $n - 1$ . For each  $i = 1, \dots, g$ ,  $U_i = \{p \in \text{Spec } R; z_i \subset p, \text{ height } p/z_i = 1, \text{ and } R/p \text{ isn't unmixed}\}$  is a finite set [1, 5.9]. Therefore let  $x_i \in M$ ,  $\notin \bigcup \{p; p \in \bigcup U_i\}$ . Now, for  $i = 1, \dots, g$ ,  $R/z_i$  is unmixed [5, Proposition 3], so  $\mathcal{S}((x_1 + z_i)(R/z_i))$  is a finite  $R/z_i$ -algebra 6.5. Also, for each minimal prime divisor  $Q$  of  $(x_1 + z_i)(R/z_i)$ ,  $(R/z_i)/Q$  is unmixed (by the choice of  $b$ ) and  $\text{depth } Q = \text{depth } z_i - 1 = n - 1$ . Let  $Z = \bigcap \{P \in \text{Spec } R; P \text{ is a minimal prime divisor of } x_1 R\}$ . Then  $R/Z$  is unmixed [5, Proposition 3] (since each  $(R/Z)/(P/Z)$  is unmixed and  $\text{altitude } R/P = \text{depth } P/Z = n - 1$  (since  $R$  satisfies the f.c.c.)), so by induction, let  $x_2, \dots, x_n \in M$  such that their residue classes modulo  $Z$  are a s.o.p. in  $R/Z$  that satisfy the condition. Then it readily follows that  $x_1, \dots, x_n$  is a s.o.p. in  $R$  which satisfy the condition.

Conversely, assume that  $R$  satisfies the f.c.c. and has a s.o.p. which satisfy the condition. Then it will be shown by induction on  $n$  that  $R$  is unmixed. If  $n = 1$ , then it is well known that  $R$  is unmixed (since all prime divisors of zero are minimal), so assume that  $n > 1$ . Let  $z_1, \dots, z_g$  be the (minimal) prime divisors of zero in  $R$ , and fix  $z = z_i$ . Now, by hypothesis,  $\mathcal{S}((x_1 + z)(R/z))$  is a finite

$R/z$ -algebra and, for each minimal prime divisor  $Q$  of  $(x_1 + z)(R/z)$ ,  $\text{depth } Q = \text{altitude } R/z - 1 = n - 1$ . Further,  $(R/z)/Q$  is unmixed (by induction on  $n$ , since  $(R/z)/Q$  satisfies the f.c.c. and the residue classes of  $x_2, \dots, x_n$  are a s.o.p. which satisfy the condition). Therefore  $R/z$  is unmixed 6.4 and  $\text{depth } z = \text{altitude } R$  (by the f.c.c.), so  $R$  is unmixed [5, Proposition 3].

Finally, let  $R$  be unmixed and  $q \in \mathcal{P}$ , say  $q$  is a minimal prime divisor of  $(x_1, \dots, x_i)R$ . Then  $R/q$  satisfies the f.c.c. and the residue classes modulo  $q$  of  $x_{i+1}, \dots, x_n$  are a s.o.p. which satisfy the condition, so  $R/q$  is unmixed (by what has already been proved, for  $0 \leq i \leq n - 2$ ; and clearly for  $i = n - 1, n$ ).

The final result in this paper characterizes in an unmixed local domain  $R$  when  $R/(\text{Rad } bR)$  is unmixed. (This result is of some interest, since it is still an open problem whether  $R/p$  is unmixed, for all height one prime ideals  $p$  in an unmixed local domain  $R$ .) For this characterization, we extend the definition of  $\mathcal{T}(bA)$  to the case of a Noetherian ring (with non-zero divisors of zero) as follows: if  $b$  is a regular element in a Noetherian ring  $A$ , then  $\mathcal{T}(bA) = A[1/b] \cap A_{[S]}$ , where  $S = A - \bigcup \{p \in \text{Spec } A; b \in p \text{ and height } p = 1\}$  and  $A_{[S]} = \{a/s; a \in A \text{ and } s \text{ is a regular element in } S\}$ . (If  $p \in \text{Spec } A$ , then let  $A_{[p]} = A_{[A-p]}$ .) (Most of the statements in 3.2 continue to hold in this case, as is proved in the cited references.)

**THEOREM 6.9.** *Let  $R$  be an unmixed semi-local domain, and let  $0 \neq b \in J = \text{the Jacobson radical of } R$ . Then  $R/(\text{Rad } bR)$  is unmixed if and only if the completion of  $\mathcal{T}(bR)$  is  $\mathcal{T}(bR^*)$ , where  $R^*$  is the completion of  $R$ .*

*Proof.* Since  $R$  is unmixed,  $R^{(1)}$  is a finite  $R$ -algebra [9, Lemma 5.11], so  $\mathcal{T}(bR)$  is a finite  $R$ -algebra, for each  $0 \neq b \in J$ . Fix  $0 \neq b \in J$ , and let  $\mathcal{T}^*$  be the completion of  $\mathcal{T} = \mathcal{T}(bR)$ . Then, as will now be shown,  $\mathcal{T}^* \subseteq \mathcal{T}(bR^*)$  and  $\mathcal{T}(bR^*) \cap F = \mathcal{T}$ , where  $F$  is the quotient field of  $R$ . Namely, it is readily seen that  $R^*[1/b] \cap F = R[1/b]$ . Also, for each minimal prime divisor  $p^*$  of  $bR^*$ ,  $R_{p^*}^*$  is a faithfully flat  $R_p$ -algebra [6, 19.2(3)], where  $p = p^* \cap R$  (so  $p$  is a minimal prime divisor of  $bR$ ). Therefore  $R_{p^*}^* \cap F = R_p$  [6, 18.4], so it readily follows that  $R_{[p^*]}^* \cap F = R_p$ . Further, if  $q$  is a minimal prime divisor of  $bR$ , then there exists a minimal prime divisor  $q^*$  of  $bR^*$  such that  $q^* \cap R = q$  [6, 18.11], hence  $R_{[q^*]}^* \cap F = R_q$ . Therefore  $\mathcal{T}(bR^*) \cap F = \mathcal{T}(bR)$ , and so  $\mathcal{T}^* = R^*[\mathcal{T}] \subseteq \mathcal{T}(bR^*)$ .

Now  $b\mathcal{T}(bR^*)$  is pure height one 3.2.6, and  $\mathcal{T}(bR^*)$  is the smallest ring  $A$  such that  $R^* \subseteq A \subseteq R^*$  (=the integral closure of  $R^*$ ) such that  $bA$  is pure height one. For, if  $bA$  is pure height

one, then, with  $S' = \{p \in \text{Spec } A; b \in p \text{ and height } p = 1\}$  and  $U' = A - \bigcup \{p; p \in S'\}$ ,  $A = A[1/b] \cap A_{[U']}$  (since if  $x \in A[1/b] \cap A_{[U']}$ , then  $x = a/b^k$ , for some  $a \in A$  and  $k \geq 1$ , and  $a \in b^k A_{[U']} \cap A = b^k A$ , so  $\dot{x} \in A$ ; and the opposite conclusion is clear). Also, if  $p \in S'$ , then  $p \cap R^*$  is a height one prime divisor of  $bR^*$  (since  $R$  is unmixed implies that  $\text{height } p \cap R^* = \text{height } p$ ). Therefore, with  $S = \{p^* \in \text{Spec } R^*; b \in p^* \text{ and height } p^* = 1\}$ ,  $\mathcal{T}(bR^*) = R^*[1/b] \cap R_{[U]}^* \subseteq A$ , where  $U = R^* - \bigcup \{p^*; p^* \in S\}$ .

Therefore, since  $\mathcal{T}^* \subseteq \mathcal{T}(bR^*)$ ,  $b\mathcal{T}^*$  is pure height one if and only if  $\mathcal{T}^* = \mathcal{T}(bR^*)$ . Also, since  $\mathcal{T}$  is unmixed (since  $R$  is),  $b\mathcal{T}^*$  is pure height one if and only if every prime divisor of  $b\mathcal{T}^*$  has  $\text{depth} = \text{altitude } R - 1$  if and only if  $\mathcal{T}/b\mathcal{T}$  is unmixed if and only if  $R/(\text{Rad } bR)$  is unmixed (as in the first paragraph of the proof of 6.4, since a semi-local ring  $L$  is unmixed if and only if, for each prime divisor  $z$  of zero in  $L$ ,  $\text{depth } z = \text{altitude } L$  and  $L/z$  is unmixed).

The Supporting Institutions listed above contribute to the cost of publication of this Journal, but they are not owners or publishers and have no responsibility for its content or policies.

---

Mathematical papers intended for publication in the *Pacific Journal of Mathematics* should be in typed form or offset-reproduced, (not dittoed), double spaced with large margins. Please do not use built up fractions in the text of your manuscript. You may however, use them in the displayed equations. Underline Greek letters in red, German in green, and script in blue. The first paragraph or two must be capable of being used separately as a synopsis of the entire paper. Items of the bibliography should not be cited there unless absolutely necessary, in which case they must be identified by author and Journal, rather than by item number. Manuscripts, in triplicate, may be sent to any one of the editors. Please classify according to the scheme of Math. Reviews, Index to Vol. **39**. All other communications should be addressed to the managing editor, or Elaine Barth, University of California, Los Angeles, California, 90024.

The Pacific Journal of Mathematics expects the author's institution to pay page charges, and reserves the right to delay publication for nonpayment of charges in case of financial emergency.

100 reprints are provided free for each article, only if page charges have been substantially paid. Additional copies may be obtained at cost in multiples of 50.

---

The *Pacific Journal of Mathematics* is issued monthly as of January 1966. Regular subscription rate: \$72.00 a year (6 Vols., 12 issues). Special rate: \$36.00 a year to individual members of supporting institutions.

Subscriptions, orders for back numbers, and changes of address should be sent to Pacific Journal of Mathematics, 103 Highland Boulevard, Berkeley, California, 94708.
