**ENUMERATION OF DOUBLY UP-DOWN PERMUTATIONS**

L. CARLITZ

# ENUMERATION OF DOUBLY UP-DOWN PERMUTATIONS

L. CARLITZ

**It is well known that  $A(n)$ , the number of up-down permutations of  $\{1, 2, \dots, n\}$  satisfies**

$$\sum_{n=0}^{\infty} A(2n) \frac{z^{2n}}{(2n)!} = \sec z,$$

$$\sum_{n=0}^{\infty} A(2n+1) \frac{z^{2n+1}}{(2n+1)!} = \tan z.$$

In the present paper generating functions are obtained for up-down (down-up) permutations in which the peaks themselves are in an up-down configuration.

In a previous paper the writer obtained generating functions for the number of up-down (and down-up) permutations counting the rises among the “peaks”.

1. Let  $Z_n = \{1, 2, \dots, n\}$  and let  $(a_1, a_2, \dots, a_n)$  be an arbitrary [4, pp. 105–112] up-down permutation of  $Z_n$ . Then  $(b_1, b_2, \dots, b_n)$ , where

$$b_i = n - a_i + 1 \quad (i = 1, 2, \dots, n)$$

is a down-up permutation and vice versa. Thus, for  $n > 1$ , there is a one-to-one correspondence between up-down and down-up permutations so that it suffices to consider the former.

In the present paper we are concerned with up-down (and down-up) permutations of  $Z_n$  in which it is required that the peaks themselves satisfy the up-down or down-up conditions. Thus let  $(a_1, a_2, \dots, a_n)$  denote an up-down permutation of  $Z_n$  so that

$$(1.1) \quad a_{2k-1} < a_{2k}, \quad a_{2k} > a_{2k+1} \quad (k = 1, 2, \dots, [n/2]).$$

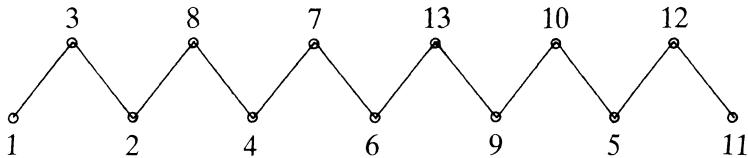

Then the additional requirement is either

$$(1.2) \quad a_{4k-2} < a_{4k}, \quad a_{4k} > a_{4k+2} \quad (k = 1, 2, \dots, [n/4])$$

or

$$(1.3) \quad a_{4k-2} > a_{4k}, \quad a_{4k} < a_{4k+2} \quad (k = 1, 2, \dots, [n/4]).$$

For example the permutation  $(1, 3, 2, 8, 4, 7, 6, 13, 9, 10, 5, 12, 11)$

satisfies both (1.1) and (1.2).

Next let  $(a_1, a_2, \dots, a_n)$  be a down-up permutation of  $Z_n$  so that

$$(1.4) \quad a_{2k-1} > a_{2k}, \quad a_{2k} < a_{2k+1} \quad (k = 1, 2, \dots, [n/2]).$$

Then the additional requirement is either

$$(1.2)' \quad a_{4k-3} > a_{4k-1}, \quad a_{4k-1} < a_{4k+1} \quad (k = 1, 2, \dots, [n/4])$$

or

$$(1.3)' \quad a_{4k-3} < a_{4k-1}, \quad a_{4k-1} < a_{4k+1} \quad (k = 1, 2, \dots, [n/4]).$$

Thus there are four possibilities, namely

- I. (1.1) and (1.2),
- II. (1.1) and (1.3),
- III. (1.4) and (1.2)',
- IV. (1.4) and (1.3)'.

There are various relations between these varieties of permutations; however they depend upon the residue of  $n$  (mod 4).

In order to derive generating functions it will be convenient to define the following enumerants. Let  $A_{RF}(n)$  denote the number of up-down permutations of  $Z_n$  such that the peaks

$$(a_2, a_4, \dots, a_{2[n/2]})$$

begin with a rise,  $a_2 < a_4$ , and end with a fall. Thus for this case it is necessary that  $n \equiv 2$  or  $3$  (mod 4).

We define  $A_{RR}(n)$ ,  $A_{FR}(n)$ ,  $A_{FF}(n)$  in a similar way. Note that for  $RR$ ,  $n \equiv 0$  or  $1$  (mod 4); for  $FR$ ,  $n \equiv 2$  or  $3$  (mod 4); for  $FF$ ,  $n \equiv 0$  or  $1$  (mod 4).

We also define  $C_{RF}(n)$ ,  $C_{RR}(n)$ ,  $C_{FR}(n)$ ,  $C_{FF}(n)$  in an analogous manner for down-up permutations. Then for  $RF$ ,  $n \equiv 1$  or  $2$  (mod 4), for  $RR$ ,  $n \equiv 0$  or  $3$  (mod 4), for  $FR$ ,  $n \equiv 1$  or  $2$  (mod 4), for  $FF$ ,  $n \equiv 0$  or  $3$  (mod 4).

We shall accordingly consider the following enumerants:

$$(1.5) \quad \begin{cases} A_{RF}(4n+3), & A_{RF}(4n+2) \\ A_{RR}(4n+1), & A_{RR}(4n) \\ A_{FR}(4n+3), & A_{FR}(4n+2) \\ A_{FF}(4n+1), & A_{FF}(4n) \end{cases}$$

$$(1.6) \quad \begin{cases} C_{RF}(4n+1), & C_{RF}(4n+2) \\ C_{RR}(4n+3), & C_{RR}(4n) \\ C_{FR}(4n+1), & C_{FR}(4n+2) \\ C_{FF}(4n+3), & C_{FF}(4n) \end{cases}$$

Reading a permutation both from left to right and from right to left, we get the following relations connecting the enumerants.

$$(1.7) \quad \begin{cases} A_{RR}(4n+1) = A_{FF}(4n+1) \\ A_{RR}(4n) = C_{FF}(4n) \\ A_{FF}(4n) = C_{RR}(4n) \\ A_{RF}(4n+2) = C_{RF}(4n+2) \\ A_{FR}(4n+2) = C_{FR}(4n+2) \\ C_{RR}(4n+3) = C_{FF}(4n+3). \end{cases}$$

Put

$$(1.8) \quad \begin{cases} y_{RF}(x) = \sum_{n=0}^{\infty} A_{RF}(4n+3) \frac{x^{4n+3}}{(4n+3)!} & (A_{RF}(3)=2) \\ y_{RR}(x) = \sum_{n=0}^{\infty} A_{RR}(4n+1) \frac{x^{4n+1}}{(4n+1)!} & (A_{RR}(1)=1) \\ y_{FR}(x) = \sum_{n=0}^{\infty} A_{FR}(4n+3) \frac{x^{4n+3}}{(4n+3)!} & (A_{FR}(3)=2) \\ y_{FF}(x) = \sum_{n=0}^{\infty} A_{FF}(4n+1) \frac{x^{4n+1}}{(4n+1)!} & (A_{FF}(1)=1) \end{cases}$$

$$(1.9) \quad \begin{cases} z_{RF}(x) = \sum_{n=0}^{\infty} A_{RF}(4n+2) \frac{x^{4n+2}}{(4n+2)!} & (A_{RF}(2)=1) \\ z_{RR}(x) = \sum_{n=0}^{\infty} A_{RR}(4n) \frac{x^{4n}}{(4n)!} & (A_{RR}(0)=1) \\ z_{FR}(x) = \sum_{n=0}^{\infty} A_{FR}(4n+2) \frac{x^{4n+2}}{(4n+2)!} & (A_{FR}(2)=1) \\ z_{FF}(x) = \sum_{n=0}^{\infty} A_{FF}(4n) \frac{x^{4n}}{(4n)!} & (A_{FF}(0)=1) \end{cases}$$

$$(1.10) \quad \left\{ \begin{array}{l} \bar{y}_{RF}(x) = \sum_{n=0}^{\infty} C_{RF}(4n+1) \frac{x^{4n+1}}{(4n+1)!} \quad (C_{RF}(1)=1) \\ \bar{y}_{RR}(x) = \sum_{n=0}^{\infty} C_{RR}(4n+3) \frac{x^{4n+3}}{(4n+3)!} \quad (C_{RR}(3)=2) \\ \bar{y}_{FR}(x) = \sum_{n=0}^{\infty} C_{FR}(4n+1) \frac{x^{4n+1}}{(4n+1)!} \quad (C_{FR}(1)=1) \\ \bar{y}_{FF}(x) = \sum_{n=0}^{\infty} C_{FF}(4n+3) \frac{x^{4n+3}}{(4n+3)!} \quad (C_{FF}(3)=2) \end{array} \right.$$

$$(1.11) \quad \left\{ \begin{array}{l} \bar{z}_{RF}(x) = \sum_{n=0}^{\infty} C_{RF}(4n+2) \frac{x^{4n+2}}{(4n+2)!} \quad (C_{RF}(2)=1) \\ \bar{z}_{RR}(x) = \sum_{n=0}^{\infty} C_{RR}(4n) \frac{x^{4n}}{(4n)!} \quad (C_{RR}(0)=1) \\ \bar{z}_{FR}(x) = \sum_{n=0}^{\infty} C_{FR}(4n+2) \frac{x^{4n+2}}{(4n+2)!} \quad (C_{FR}(2)=1) \\ \bar{z}_{FF}(x) = \sum_{n=0}^{\infty} C_{FF}(4n) \frac{x^{4n}}{(4n)!} \quad (C_{FF}(0)=1). \end{array} \right.$$

In view of (1.7), we get

$$(1.12) \quad \left\{ \begin{array}{l} y_{RR}(x) = y_{FF}(x), \quad z_{RR}(x) = \bar{z}_{FF}(x), \quad z_{FF}(x) = \bar{z}_{RR}(x) \\ z_{RF}(x) = \bar{z}_{RF}(x), \quad z_{FR}(x) = \bar{z}_{FR}(x), \quad \bar{y}_{RR}(x) = \bar{y}_{FF}(x). \end{array} \right.$$

Note that, for example, in taking

$$A_{RF}(3) = A_{FR}(3) = 2,$$

we are listing the up-down permutation  $(1, 3, 2)$  and  $(2, 3, 1)$  both under  $RF$  and  $FR$ . This is done so that the recurrences given below will be satisfied. A like remark applies in a number of other instances, as is evident from an examination of (1.8), ..., (1.11).

In the remainder of the paper we evaluate the sixteen enumerants defined in (1.8), ..., (1.11). For a summary of results see §6 below.

**2. Evaluation of  $y_{RF}(x)$ ,  $y_{RR}(x)$ ,  $y_{FF}(x)$ ,  $y_{FR}(x)$ .** We consider first  $y_{RF}(x)$ . The method employed is to take a typical permutation of  $Z_n$  and consider the effect of removing the largest element. This is indeed the method used in [1]. Clearly the element removed must be a peak. The given permutation breaks into two pieces one of which may be vacuous. Thus for  $A_{RF}(4n+3)$  we get the recurrence

$$(2.1) \quad A_{RF}(4n+3) = \sum_{k=0}^{n-1} \binom{4n+2}{4k+3} A_{RF}(4k+3) A_{RF}(4n-4k-1) \\ (n \geq 1, \quad A_{RF}(3) = 2).$$

It follows that the generating function  $y_{RF}(x)$  satisfies the differential equation

$$(2.2) \quad y'_{RF}(x) = y^2_{RF}(x) + x^2.$$

Now put

$$(2.3) \quad y_{RF}(x) = -\frac{U'(x)}{U(x)},$$

where

$$(2.4) \quad U(x) = \sum_{n=0}^{\infty} a_n \frac{x^{4n}}{(4n)!} \quad (a_0 = 1).$$

Substituting (2.3) in (2.2) we get

$$(2.5) \quad U''(x) + x^2 U(x) = 0.$$

This implies the recurrence

$$a_{n+1} + (4n+1)(4n+2)a_n = 0 \quad (n = 0, 1, 2, \dots)$$

and therefore

$$(2.6) \quad a_n = (-1)^n 1 \cdot 5 \cdot 9 \dots (4n-3) \cdot 2 \cdot 6 \cdot 10 \dots (4n-2).$$

Thus

$$\frac{a_n}{(4n)!} = \frac{(-1)^n}{3 \cdot 7 \cdot 11 \dots (4n-1) \cdot 4 \cdot 8 \cdot 12 \dots 4n} = \frac{(-1)^n}{4^{2n}} \frac{1}{n! (3/4)_n},$$

where

$$(a)_n = a(a+1)\dots(a+n-1).$$

Hence (2.4) becomes

$$(2.7) \quad U(x) = \sum_{n=0}^{\infty} \frac{(-1)^n}{4^{2n}} \frac{x^{4n}}{n! (3/4)_n} = {}_0F_1\left(-; \frac{3}{4}; \frac{x^4}{16}\right)$$

in the notation of generalized hypergeometric functions [5, Ch. 5].

Alternatively we may write [5, p. 108]

$$(2.8) \quad U(x) = \left(\frac{1}{2}x\right)^{\frac{1}{2}} \Gamma\left(\frac{3}{4}\right) J_{-1/4}\left(\frac{1}{2}x^2\right),$$

where  $J_{-1/4}(z)$  denotes the Bessel function of order  $-1/4$ .

In the next place, we have for  $A_{RR}(4n+1)$  the recurrence

$$(2.9) \quad A_{RR}(4n+1) = \sum_{k=0}^{n-1} \binom{4n}{4k+3} A_{RF}(4k+3) A_{RR}(4n-4k+1) \\ (n > 0, \quad A_{RR}(1) = 1).$$

This gives

$$(2.10) \quad y'_{RR}(x) = y_{RF}(x) y_{RR}(x) + 1.$$

Hence, by (2.3), (2.10) becomes

$$U(x) y'_{RR}(x) + U'(x) y_{RR}(x) = U(x)$$

and therefore

$$(2.11) \quad y_{RR}(x) = \frac{1}{U(x)} \int U(x),$$

where generally

$$(2.12) \quad \int f(x) = \int_0^x f(t) dt.$$

By (1.12) this implies

$$(2.13) \quad y_{FF}(x) = \frac{1}{U(x)} \int U(x).$$

Note that, by (2.7) and (2.12),

$$(2.14) \quad \int U = \sum_{n=0}^{\infty} \frac{(-1)^n}{4^{2n}} \frac{x^{4n+1}}{n! (3/4)_n (4n+1)}.$$

The enumerant  $A_{FR}(4n+1)$  satisfies the recurrence

$$(2.15) \quad A_{FR}(4n+3) = \sum_{k=0}^n \binom{4n+2}{4k+1} A_{FF}(4k+1) A_{RR}(4n-4k+1) \\ (n \geq 0, \quad A_{FR}(3) = 2).$$

Thus

$$y'_{FR}(x) = y_{FF}(x)y_{RR}(x).$$

Hence, by (2.11) and (2.13),

$$(2.16) \quad y'_{FR}(x) = \left\{ \frac{1}{U(x)} \int U(x) \right\}^2.$$

It can be verified that

$$(2.17) \quad U^2(x) = \sum_{n=0}^{\infty} \frac{(-1)^n}{4^{2n}} \frac{(n+1)_n x^{4n}}{n! (3/4)_n (3/4)_n}.$$

**3. Evaluation of  $z_{RF}(x)$ ,  $z_{RR}(x)$ ,  $z_{FF}(x)$ ,  $z_{FR}(x)$ .** As above we have first

$$(3.1) \quad A_{RF}(4n+2) = \sum_{k=0}^{n-1} \binom{4n+1}{4k+3} A_{RF}(4k+3) A_{RF}(4n-4k-2) \\ (n > 0, \quad A_{RF}(2) = 1).$$

This yields

$$(3.2) \quad z'_{RF}(x) = y_{RF}(x)z_{RF}(x) + x.$$

Hence, by (2.3),

$$U(x)z'_{RF}(x) + U'(x)z_{RF}(x) = xU(x),$$

so that

$$(3.3) \quad z_{RF}(x) = \frac{1}{U(x)} \int xU.$$

Note that

$$(3.4) \quad \int xU = \sum_{n=0}^{\infty} \frac{(-1)^n}{4^{2n}} \frac{x^{4n+2}}{n! (3/4)_n (4n+2)}.$$

Next

$$A_{RR}(4n) = \sum \binom{4n-1}{4k+3} A_{RF}(4k+3) A_{RR}(4n-4k-4) \\ (n \geq 1, \quad A_{RR}(0) = 1).$$

Thus

$$(3.5) \quad z'_{RR}(x) = y_{RF}(x)z_{RR}(x).$$

It follows that

$$(3.6) \quad z_{RR}(x) = \frac{1}{U(x)}.$$

For  $A_{FF}(4n)$  we have

$$(3.7) \quad A_{FF}(4n) = \sum_{k=0}^{n-1} \binom{4n-1}{4k+1} A_{FF}(4k+1) A_{RF}(4n-4k-2) \\ (n > 0, \quad A_{FF}(0) = 1).$$

This gives

$$(3.8) \quad z'_{FF}(x) = y_{FF}(x)z_{RF}(x).$$

Therefore, by (2.13) and (3.3),

$$(3.9) \quad z'_{FF}(x) = \frac{1}{U^2(x)} \int U(x) \cdot \int xU(x).$$

As for  $A_{FR}(4n+2)$ , we have

$$(3.10) \quad A_{FR}(4n+2) = \sum_{k=0}^n \binom{4n+1}{4k+1} A_{FF}(4k+1) A_{RR}(4n-2k) \\ (n \geq 0, \quad A_{FR}(2) = 1).$$

Thus

$$(3.11) \quad z'_{FR}(x) = y_{FF}(x)z_{RR}(x).$$

Then, by (2.13) and (3.6),

$$(3.12) \quad z'_{FR}(x) = \frac{1}{U^2(x)} \int U(x).$$

**4. Evaluation of  $\bar{y}_{RF}(x)$ ,  $\bar{y}_{RR}(x)$ ,  $\bar{y}_{FF}(x)$ ,  $\bar{y}_{FR}(x)$ .** To begin with

$$(4.1) \quad C_{RF}(4n+1) = \sum_{k=0}^{n-1} \binom{4n}{4k+2} C_{RF}(4k+2) A_{RF}(4n-4k-2) \\ (n > 0, \quad C_{RF}(1) = 1).$$

This gives

$$(4.2) \quad \bar{y}'_{RF}(x) = \bar{z}_{RF}(x) z_{RF}(x).$$

By (1.12),  $\bar{z}_{RF}(x) = z_{RF}(x)$ , so that (4.2) reduces to

$$(4.3) \quad \bar{y}'_{RF}(x) = \{z_{RF}(x)\}^2.$$

This formula together with (3.3) determines  $\bar{y}_{RF}(x)$ .

Next

$$(4.4) \quad C_{RR}(4n+3) = \sum_{k=0}^n \binom{4n+2}{4k+2} C_{RF}(4k+2) A_{RR}(4n-4k) \\ (n \geq 0, \quad C_{RR}(3) = 1),$$

so that

$$(4.5) \quad \bar{y}'_{RR}(x) = \bar{z}_{RF}(x) z_{RR}(x) = z_{RF}(x) z_{RR}(x).$$

Hence

$$(4.6) \quad \bar{y}'_{RR}(x) = \frac{1}{U^2(x)} \int x U(x).$$

Since by (1.12),  $\bar{y}_{FF}(x) = \bar{y}_{RR}(x)$ , we have also

$$(4.7) \quad \bar{y}'_{FF}(x) = \frac{1}{U^2(x)} \int x U(x).$$

In the next place

$$(4.8) \quad C_{FR}(4n+1) = \sum_{k=0}^n \binom{4n}{4k} C_{FF}(4k) A_{RR}(4n-4k) \\ (n \geq 0, \quad C_{FR}(1) = 1).$$

This gives

$$(4.9) \quad \bar{y}'_{FR}(x) = \bar{z}_{FF}(x) z_{RR}(x) = \{z_{RR}(x)\}^2,$$

since  $\bar{z}_{FF}(x) = z_{RR}(x)$ . Therefore, by (3.6),

$$(4.10) \quad \bar{y}'_{FR}(x) = \frac{1}{U^2(x)}.$$

**5. Second solution of (2.5).** One solution of the differential equation

$$(5.1) \quad w'' + x^2 w = 0$$

is given by  $w_1 = U(x)$ . For a second solution we take

$$(5.2) \quad w_2 = U(x)V(x), \quad V(x) = \sum_{n=0}^{\infty} b_n \frac{x^{4n+1}}{(4n+1)!} \quad (b_0 = 1).$$

Clearly  $w_1$  and  $w_2$  are linearly independent. Substituting from (5.2) in (5.1) we get

$$(5.3) \quad 2U'(x)V'(x) + U(x)V''(x) = 0.$$

This gives

$$(5.4) \quad V'(x) = \frac{1}{U^2(x)}.$$

Comparing (5.4) with (4.10), it is clear that

$$(5.5) \quad V(x) = \bar{y}_{FR}(x),$$

so that the second solution of (5.1) becomes

$$(5.6) \quad w_2 = U(x)\bar{y}_{FR}(x).$$

## 6. Summary of results.

$$(6.1) \quad y_{RF}(x) = -\frac{U'(x)}{U(x)}$$

$$(6.2) \quad y_{RR}(x) = y_{FF}(x) = \frac{1}{U(x)} \int U(x)$$

$$(6.3) \quad y'_{FR}(x) = \left\{ \frac{1}{U(x)} \int U(x) \right\}^2$$

$$(6.4) \quad z_{RF}(x) = \bar{z}_{RF}(x) = \frac{1}{U(x)} \int x U(x)$$

$$(6.5) \quad z_{RR}(x) = \bar{z}_{FF}(x) = \frac{1}{U(x)}$$

$$(6.6) \quad z'_{FF}(x) = \bar{z}'_{RR}(x) = \frac{1}{U^2(x)} \int U(x) \cdot \int x U(x)$$

$$(6.7) \quad z'_{FR}(x) = z'_{RF}(x) = \frac{1}{U^2(x)} \int U(x)$$

$$(6.8) \quad \bar{y}'_{RF}(x) = \{z_{RF}(x)\}^2$$

$$(6.9) \quad \bar{y}_{RR}(x) = \bar{y}_{FF}(x) = \frac{1}{U^2(x)} \int x U(x)$$

$$(6.10) \quad \bar{y}'_{FR}(x) = \frac{1}{U^2(x)}$$

$$(6.11) \quad U(x) = \sum_{n=0}^{\infty} \frac{(-1)^n}{4^{2n}} \frac{x^{4n}}{n! (3/4)_n}$$

$$(6.12) \quad U^2(x) = \sum_{n=0}^{\infty} \frac{(-1)^n}{4^{2n}} \frac{(n + \frac{1}{2})_n x^{4n}}{n! (3/4)_n (3/4)_n}.$$

Linearly independent solutions of

$$w'' + x^2 w = 0$$

are furnished by

$$(6.13) \quad w_1 = U(x), \quad w_2 = U(x) \bar{y}_{FR}(x).$$

**7. Generalizations.** We may define *doubly* up-down permutations as permutations  $(a_1, a_2, \dots, a_n)$  of  $Z_n$  such that

$$(7.1) \quad a_{2k-1} < a_{2k}, \quad a_{2k} > a_{2k+1} \quad (k = 1, 2, \dots, [n/2])$$

and

$$(7.2) \quad a_{4k-2} < a_{4k}, \quad a_{4k} > a_{4k+2} \quad (k = 1, 2, \dots, [n/4]).$$

Similarly we may define *triply* up-down as permutations that satisfy (7.1) and (7.2) and in addition

$$(7.3) \quad a_{8k-4} < a_{8k}, \quad a_{8k} > a_{8k+4} \quad (k = 1, 2, \dots, [n/8]).$$

It is clear how to extend this definition to  $r$ -ply up-down permutations. Thus this suggests the enumeration of permutations of these types.

An extension in a different direction is the following. Let  $A_3(n)$  denote the number of permutations of  $Z_n$  that satisfy

$$(7.4) \quad a_{3k-2} < a_{3k-1} < a_{3k}, \quad a_{3k} > a_{3k+1} \quad (k = 1, 2, \dots, [n/3]).$$

Then, as a special case of a result proved in [2], [3], we have

$$(7.5) \quad \sum_{n=0}^{\infty} A_3(3n) \frac{x^{3n}}{(3n)!} = \left\{ \sum_{n=0}^{\infty} \frac{(-1)^n}{(3n)!} \right\}^{-1}.$$

This suggests the consideration of permutations that satisfy (7.4) and in addition

$$(7.6) \quad a_{9k-6} < a_{9k-3} < a_{9k}, \quad a_{9k} > a_{9k+3} \quad (k = 1, 2, \dots, [n/9]).$$

Moreover further restrictions analogous to (7.3) can also be introduced.

However we shall not treat these extensions in the present paper.
