# PRIME IDEAL DECOMPOSITION IN $F(\mu^{1/p})$

# WILLIAM YSLAS VÉLEZ

Let F be a finite extension of the field of rational numbers,  $\mathscr{P}$  a prime ideal in the ring of algebraic integers in F, and  $x^m - \mu$ irreducible over F. If m is a prime and  $\zeta_m \in F$ , then the ideal decomposition of  $\mathscr{P}$  in  $F(\mu^{1/m})$  has been described by Hensel. If m = l', l a prime and  $(l, \mathscr{P}) = 1$ , then the decomposition of  $\mathscr{P}$  in  $F(\mu^{1/l'})$  was obtained by Mann and Vélez, with no restriction on roots of unity. In this paper we describe the decomposition of  $\mathscr{P}$  in the fields  $F(\zeta_p)$  and  $F(\mu^{1/p})$ , where  $\mathscr{P} \supset (p)$ .

**I.** Notation and introduction. Let  $\mathcal{D}$  denote the rational numbers and F a finite extension of  $\mathcal{D}$  where the degree of an extension is denoted by  $[F:\mathcal{D}]$ . By a prime ideal  $\mathcal{P}$  in F we shall mean a prime, integral ideal in the ring of algebraic integers in F. For an ideal  $\mathcal{P}$ , we have  $N(\mathcal{P}) = p^{f}$ , p a prime, where N denotes the absolute norm and  $(p) = \mathcal{P}^{a}\mathcal{A}, (\mathcal{P}, \mathcal{A}) = 1$ , where (a, b) denotes the greatest common divisor of a and b. If p-1|a, then we set  $a = sp^{k-1}(p-1), (s, p) = 1$ . By  $F_{\mathcal{P}}$  we shall mean the  $\mathcal{P}$ -adic completion of F, [x] denotes the largest integer less than or equal to x, a/b + c shall mean a/(b + c), and  $\zeta_{p'}$  denotes a primitive p'-root of unity.

If A is an abelian group, then we say that  $\{\alpha_i\}_{i \in I}$ , is a basis for A if  $A = \bigoplus_{i \in I} \langle \alpha_i \rangle$ , where  $\langle \alpha_i \rangle$  denotes the group generated by  $\alpha_i$  in A. We say  $p^c || b$  if  $p^c | b$ ,  $p^{c+1} \not\prec b$ .

This paper is devoted to a generalization of what is called in the literature, "Kummer's Theorem." This theorem deals with the ideal decomposition of prime ideals in F when considered as ideals in  $F(\mu^{1/p})$ .

Hilbert [12, pg. 254–257] proved the following theorem:

THEOREM 1.1. If  $x^p - \mu$  is irreducible over  $\mathcal{Q}(\zeta_p)$ ,  $(\mu, \mathcal{P}) = 1$ , then in  $\mathcal{Q}(\zeta_p, \mu^{1/p})$  we have

(1) the ideal  $\mathcal{P}$  splits into p factors iff  $\mu \equiv \xi^p \pmod{\mathcal{P}^{p+1}}$ ,

(2) the ideal  $\mathcal{P}$  remains prime iff  $\mu \neq \xi^{p} \pmod{\mathcal{P}^{p+1}}, \mu \equiv \xi^{p} \pmod{\mathcal{P}^{p}}, \mu \equiv \xi^{p} \pmod{\mathcal{P}^{p}}$ 

(3) the ideal  $\mathcal{P}$  becomes the pth-power of a prime ideal iff  $\mu \neq \xi^{p}$  (mod  $\mathcal{P}^{p}$ ).

Later Hensel [9, 10] generalized these theorems to the situation where  $\zeta_p \in F_{\mathcal{P}}$ . Hensel calls these theorems "Kummer's Theorem," but

he references Hilbert, and Hilbert gives no reference for these theorems.

In §4 we describe the decomposition rules for the extensions  $F(\mu^{1/p})$ and  $F(\zeta_p)$  over F, for those prime ideals which divide p. Sections 2 and 3 develop some machinery to tackle this problem. This machinery will hopefully be used to describe the decomposition rules for the case  $F(\mu^{1/p^c})$ , c > 1, in a subsequent paper.

We point out that decomposition rules for the ideal  $\mathcal{P}$  in the extension  $F(\mu^{1/l^e})$ , *l* a prime different from *p*, have already been worked out. We refer the reader to the paper by Mann and Vélez.

This paper is based on my Ph.D. thesis at the University of Arizona. I wish to express my deep appreciation to Professor Henry B. Mann for his advice and encouragement during that venture.

**II.** Preliminaries. We say that  $\alpha$  is a principal unit if  $\alpha \equiv 1 \pmod{\mathcal{P}}$ .

Let  $\mathscr{G}_m$  be the multiplicative group of units modulo  $\mathscr{P}^m$ . Then  $|\mathscr{G}_m| = \Phi(\mathscr{P}^m) = (p^f - 1)p^{f(m-1)}$ , where  $\Phi$  is the Euler function. Clearly  $\mathscr{G}_m$  is abelian. It can be shown that  $\zeta_{p'-1} \in F_{\mathscr{P}}$  and that  $\mathscr{G}_m = \langle \zeta_{p'-1} \rangle \bigoplus G_m$ , where  $G_m$  is the multiplicative group of principal units modulo  $\mathscr{P}^m$ , and  $|G_m| = p^{f(m-1)}$ .

There have been several papers devoted to the study of  $G_m$ , e.g., Wolf [25], Tagenouchi [18], Hensel [5,6,7,8,11] and Mann [14]. We state some results which we shall need later. We first determine the rank of  $G_m$ , denoted by  $R(G_m)$ , as a *p*-group [see Fuchs 3, pg. 85].

THEOREM 2.1. If  $m \leq ap/p - 1$ , then  $R(G_m) = (m - 1 - [(m - 1)/p])f$ . If  $m \geq ap/p - 1$ ,  $\zeta_p \notin F_{\mathcal{P}}$ , then  $R(G_m) = af$ . If m = ap/p - 1,  $\zeta_p \in F_{\mathcal{P}}$ , then  $R(G_m) = af$ . If m > ap/p - 1,  $\zeta_p \in F_{\mathcal{P}}$ , then  $R(G_m) = af + 1$ .

*Proof.* See Mann [14, pg. 3, pg. 9], Tagenouchi [18, pg. 22], Hensel [6, §§3 and 4], Vélez [19, pg. 10].

We now construct a basis for  $G_m$ , for m not too large. The residue system modulo  $\mathscr{P}$  forms a finite, commutative field of degree f over its prime field. Hence, there exist algebraic integers  $\{g_1, \dots, g_f\}$  such that every element modulo  $\mathscr{P}$  can be written uniquely as

$$\sum_{i=1}^{f} a_i g_i, \qquad a_i \in \{0, 1, \cdots, p-1\}.$$

The set  $\{g_1, \dots, g_f\}$  will be called an additive basis.

From the collection of positive integers choose the smallest a of them which are relatively prime to p and call them  $k_1 < k_2 < \cdots < k_a$ . Let  $\pi$  be an algebraic integer such that  $\mathcal{P} \parallel \pi$ .

Set

(2.1) 
$$\eta_{ij} = 1 + g_i \pi^{k_j}.$$

THEOREM 2.2. (1) If  $m \le ap/p - 1$  and q = m - 1 - [(m - 1)/p], then  $\{\eta_{\eta} | i = 1, \dots, f; j = 1, \dots, q\}$  is a basis for  $G_m$ .

(2) If  $\zeta_p \notin F_{\mathscr{P}}$  and  $m \ge ap/p - 1$ , then  $\{\eta_{ij} | i = 1, \dots, f; j = 1, \dots, a\}$  is a basis for  $G_m$ .

*Proof.* See Mann [14, pg. 8], Hensel [6, pgs. 204, 205], Vélez [19, pg. 26].

Now, let  $\zeta_p \in F_{\mathcal{P}}$ . Then clearly  $p-1 \mid a$ , so ap/p-1 is an integer. Since  $R(G_m) = af+1$ , when m > ap/p-1, we need an extra element.

LEMMA 2.1. Let  $-p \equiv \pi^a g^{p-1} \pmod{\mathcal{P}^{a+1}}$ , then there is a g' such that  $x^p - g^{p-1}x - g'$  has no solution modulo  $\mathcal{P}$ .

*Proof.* See Mann [14, pg. 10], Hensel [6, Section 3], Vélez [19, pg. 29].

With g' defined as in Lemma 2.1, set

$$\eta' = 1 + g' \pi^{sp^*}.$$

Note that  $sp^{k} = a + (a/p - 1)$ .

LEMMA 2.2. Let  $\zeta_p \in F_{\mathcal{P}}$  and  $m \ge ap/p - 1$ , then  $\eta'$  is not a pthpower in  $G_m$ .

*Proof.* See Mann [14, pg. 10, 11], Hensel [6, §4], Vélez [19, pg. 29].

THEOREM 2.3. If  $\zeta_p \in F_{\mathscr{P}}$  and  $m = (ap/p - 1) + 1 = sp^k + 1$ , then  $\{\eta', \eta_{\eta} | i = 1, \dots, f; j = 1, \dots, a\}$  forms a basis for  $G_m$ . If  $m > sp^k + 1$ , then  $\{\eta', \eta_{\eta} | i = 1, \dots, f; j = 1, \dots, a\}$  is a generating set for  $G_m$ , though it is not necessarily a basis.

*Proof.* See Mann [14, pgs. 12–14], Hensel [6, §4], Vélez [19, pg. 29].

**III.** Analysis in  $F_{\mathcal{P}}$ . Let  $A = \{\alpha_i\}$  be a complete residue system modulo  $\mathcal{P}$ . That is, if  $\beta$  is an integer in F, then there exists a

unique *i* such that  $\beta \equiv \alpha_i \pmod{\mathcal{P}}$ . Let  $\mathcal{P} \parallel \pi$ , then every element  $\gamma \in F_{\mathcal{P}}$  can be written uniquely as

$$\gamma=\sum_{n=l}^{\infty}a_n\pi^n, \qquad l\in Z, \quad a_n\in A.$$

We say that  $\gamma$  is an integer if  $l \ge 0$ . If

$$x=\sum_{n=l}^{\infty}\gamma_n\pi^n,$$

 $\gamma_n$  is an integer for all *n* and  $\gamma_l \neq 0 \pmod{\mathcal{P}}$ , then we set  $\nu_{\mathcal{P}}(x) = l$ . Let  $\nu(x) = \nu_{\mathcal{P}}(x)$  if there is no danger of ambiguity.

It is clear that  $\nu(x)$  is well-defined. Moreover,  $\nu(x) = l$  iff  $\mathscr{P}^{l} || x$ . It can also be shown that the series  $\sum_{n=0}^{\infty} \beta_n$ ,  $\beta_n \in F_{\mathscr{P}}$ , converges in  $F_{\mathscr{P}}$  iff  $\lim_{n\to\infty} \nu(\beta_n) = \infty$  in  $\mathscr{Q}$ .

Fact 1. The domain of convergence of the exponential series  $E(x) = \sum_{n=0}^{\infty} x^n/n!$ , is the set of all x for which  $\nu(x) > N$ , where N = [a/p - 1]. The domain of convergence of the logarithmic series  $\log(1 + x) = \sum_{n=1}^{\infty} (-1)^{n-1} x^n/n$ , is the set of all x for which  $\nu(x) \ge 1$ .

Let  $f(y) = \sum_{n=0}^{\infty} a_n y^n$  and  $g(x) = \sum_{m=1}^{\infty} b_m x^m$ . If we substitute g(x) for y in f(y) and carry out the formal multiplications, we obtain a power series in x, which we call G(x).

Fact 2. (On Substitution of Series in Series). Let the series  $f(y) = \sum_{n=0}^{\infty} a_n y^n$  converge for all y which satisfy  $\nu(y) \ge l$ ,  $l \in \mathbb{Z}$ . If the series  $g(x) = \sum_{m=1}^{\infty} b_m x^m$  converges for some  $x \in F_{\mathscr{P}}$  and  $\nu(b_m x^m) \ge l$ , for all  $m \ge 1$ , then the series G(x) also converges (for this value of x) and

$$G(\mathbf{x}) = f(g(\mathbf{x})).$$

We note two properties of these power series:  $E(x)^n = E(nx)$ , for  $n \in \mathbb{Z}$ , and  $E(\log(1+x)) = 1+x$ , for  $\nu(x^n/n) > N$ . We refer the reader to Borevich and Shafarevich [Chapter 4] for proofs of the above statements.

THEOREM 3.1. The series  $f(x) = 1 + \sum_{n=1}^{\infty} {\binom{1/p}{n}} x^n$  converges in  $F_{\mathscr{P}}$  if  $\nu(x) > ta + N$ . Furthermore  $1 + x = (f(x))^{p'}$  for  $\nu(x) > ta + N$ .

*Proof.* The series

$$1 + \sum_{n=1}^{\infty} {\binom{1/p'}{n}} x^n = 1 + \sum_{n=1}^{\infty} (z_n/n!) (x/p')^n,$$

where  $z_n = (1-p^i)(1-2p^i)\cdots(1-(n-1)p^i)$ . Note that  $(z_n, p) = 1$ , so  $\nu(z_n) = 0$ . But  $\nu(x/p^i) = \nu(x) - \nu(p^i) > ta + N - ta = N$ . But, from Fact 1,  $\sum_{n=1}^{\infty} (1/n!)(x/p^i)^n$  converges, which implies that

$$\nu((1/n!)(x/p')^n) = \nu((z_n/n!)(x/p')^n) \to \infty \quad \text{in} \quad \mathcal{Q}.$$

Hence  $1 + \sum_{n=1}^{\infty} {\binom{1/p^{t}}{n}} x^{n}$  converges if  $\nu(x) > ta + N$ .

Consider the series  $(1/p')\log(1+x) = \sum_{n=1}^{\infty} (-1)^{n-1}x^n/np'$ , for  $\nu(x) > ta + N$ . Then we can show that  $\nu(x^n/np') > N$  for all *n*. Hence we can substitute this series in the series E(x), and formally carry out the multiplications. But since this is formal multiplication, we can perform these computations in  $\mathscr{C}[x]$ , where  $\mathscr{C}$  is the field of complex numbers. So we have

$$E((1/p')\log(1+x)) = f(x),$$

and by Fact 2, these two series converge in  $F_{\mathcal{P}}$  to the same value. But then,

$$(f(x))^{p^{i}} = E((1/p^{i})\log(1+x))^{p^{i}} = E(\log(1+x)) = 1+x.$$

THEOREM 3.2. If  $\alpha \equiv \eta^{p'} \pmod{\mathcal{P}^{ia+N+1}}$ , then there exists  $\beta \in F_{\mathcal{P}}$  such that  $\alpha = \beta^{p'}$  in  $F_{\mathcal{P}}$ .

*Proof.* If  $\alpha \equiv \eta^{p'} \pmod{\mathcal{P}^{ta+N+1}}$ , then  $\alpha/\eta^{p'} = 1+x$ , where  $\nu(x) > ta + N$ . Hence,  $(1+x)^{1/p'} \in F_{\mathcal{P}}$ . Let  $\beta = (1+x)^{1/p'}\eta$ , then  $\alpha = \beta^{p'}$ .

IV. The Decomposition of  $\mathcal{P}$  in  $F(\zeta_p)$  and  $F(\mu^{1/p})$ . Let K be a finite extension of F of degree n. We are interested in the prime ideal decomposition of  $\mathcal{P}$  in K. Assume that  $\mathcal{P}$  factors into  $g_i$  ideals of relative degree  $f_i$  and relative multiplicity  $e_i$ , that is,  $n = \sum_i g_i f_i e_i$ . Then we define the counting function

$$_{F}\Psi_{K}(\mathscr{P})=\sum_{i}g_{i}[f_{i}]^{\epsilon_{i}}.$$

For example, if K is a normal extension, then  ${}_{F}\Psi_{K}(\mathscr{P}) = g[d]^{\epsilon}$ , which means  $\mathscr{P}$  factors into g ideals, each of relative degree d and relative multiplicity e. In certain cases, these counting functions have some interesting properties. We refer the reader to the paper by Mann and Vélez.

LEMMA 4.1. If (a, b) = d, where  $a, b \in Z$ , then there exists an  $x \in Z$  such that (a, x) = 1 and bx + ay = d.

Proof. Mann and Vélez, pg. 2.

Let  $\mathcal{Q}_p$  denote the *p*-adic completion of  $\mathcal{Q}$ ;  $\mathcal{F}$ ,  $\mathcal{K}$ , and  $\mathcal{L}$  are finite extensions of  $\mathcal{Q}_p$ , and  $e(\mathcal{F}|\mathcal{Q}_p) = e'$  denotes the ramification degree of  $\mathcal{F}$  over  $\mathcal{Q}_p$ .

LEMMA 4.2. If  $\mathcal{K}$  is an unramified extension of  $\mathcal{F}$ , then  $\mathcal{K}$  is a normal extension. Furthermore, if  $\mathcal{F}' \supset \mathcal{F}$ , then  $\mathcal{K} \cdot \mathcal{F}'$  is unramified over  $\mathcal{F}'$ , where  $\mathcal{K} \cdot \mathcal{F}'$  denotes the smallest field containing both  $\mathcal{K}$  and  $\mathcal{F}'$ .

Proof. We refer the reader to Weiss [22, pgs. 83-85].

THEOREM 4.1. Let  $\mathcal{L} \cap \mathcal{F} = \mathcal{L}'$ , and  $e(\mathcal{L}'|\mathcal{D}_p) = l_1$ ,  $[\mathcal{L}: \mathcal{L}'] = e(\mathcal{L}|\mathcal{L}') = l$ , (l, p) = 1, and  $(e'/l_1, l) = d$ . Then  $\mathcal{L} = \mathcal{L}'(\pi^{1/l})$ , where  $\pi$  is some prime element in  $\mathcal{L}'$  and  $e(\mathcal{F}(\pi^{1/l})|\mathcal{F}) = l/d$ . Furthermore, if  $\mathcal{K}$  is an unramified extension of  $\mathcal{F}$ , that is,  $e(\mathcal{K}|\mathcal{F}) = 1$ , then  $e(\mathcal{K}(\pi^{1/l})|\mathcal{K}) = l/d$ .

*Proof.* We refer the reader to the paper by Vélez entitled "A Characterization of Completely Regular Fields."

The following corollary, though not new (see the paper by Ishida), is an interesting application of Theorem 4.1.

COROLLARY 1. Let  $\alpha$  be an integer in  $\mathcal{D}$  with  $(\alpha, p) = 1$ , and p an odd prime, then  $\mathcal{D}((\alpha p)^{1/p-1}, \zeta_p)$  is an abelain extension of  $\mathcal{D}((\alpha p)^{1/p-1})$  with relative discriminant 1.

**Proof.** It is clear that  $\mathcal{Q}((\alpha p)^{1/p-1}, \zeta_p)$  is an abelian extension of  $\mathcal{Q}((\alpha p)^{1/p-1})$ , and  $(p) = \mathfrak{P}^{p-1}$ , where  $\mathfrak{P} = ((\alpha p)^{1/p-1}, p)$ . Let  $\mathscr{F} = \mathcal{Q}_p((\alpha p)^{1/p-1}), \ \mathscr{L} = \mathcal{Q}_p(\zeta_p)$ , and  $\mathscr{L}' = \mathscr{F} \cap \mathscr{L}$ . Then

$$e(\mathscr{F} | \mathscr{Q}_p) = [\mathscr{F} : \mathscr{Q}_p] = e(\mathscr{L} | \mathscr{Q}_p) = [\mathscr{L} : \mathscr{Q}_p] = p - 1.$$

Let  $l' = [\mathscr{L}': \mathscr{Q}_p] = e(\mathscr{L}'|\mathscr{Q}_p)$ , then  $[\mathscr{L}: \mathscr{L}'] = e(\mathscr{L}|\mathscr{L}') = (p-1)/l'$  and (p-1)/l' = ((p-1)/l', (p-1)/l'), so  $e(\mathscr{Q}_p((\alpha p)^{1/p-1}, \zeta_p)|\mathscr{Q}_p((\alpha p)^{1/p-1}) = 1$ . Hence  $\mathscr{Q}((\alpha p)^{1/p-1}, \zeta_p)$  over  $\mathscr{Q}((\alpha p)^{1/p-1})$  is unramified.

As before, let  $\mathscr{P}$  be a prime ideal in F with  $N(\mathscr{P}) = p^{f}$  and  $(p) = \mathscr{P}^{a}\mathscr{A}$ , where  $(\mathscr{P}, \mathscr{A}) = 1$ . Let  $F \cap \mathscr{Q}(\zeta_{p}) = \mathscr{Q}^{(e_{1})}$ , where  $e_{1} = [F \cap \mathscr{Q}(\zeta_{p}): \mathscr{Q}]$  and  $\mathscr{Q}^{(e_{1})}$  is the unique subfield of  $\mathscr{Q}(\zeta_{p})$  of degree  $e_{1}$  over  $\mathscr{Q}$ . Hence  $[F(\zeta_{p}): F] = (p-1)/e_{1}$ . Let  $\mathscr{P}_{1} \subset \mathscr{Q}^{(e_{1})}, \mathscr{P}_{1} \supset (p)$ , and  $(p) = \mathbb{P}^{a}$ .

 $\mathscr{P}_1^{e_1}$ . Also since  $\mathscr{P}^a ||(p)$ , we have that  $a = a_1 e_1$  and  $\mathscr{P}^{a_1} || \mathscr{P}_1$ . Let f(x) denote the irreducible polynomial for  $\zeta_p$  over F.

THEOREM 4.2. Let  $f(x) \equiv \prod_{i=1}^{g} f_i(x) \pmod{\mathcal{P}^{a_i(p-1)/e_i}}$ , and

$$d = (a/e_1g, (p-1)/e_1g),$$

then if  $K = F(\zeta_p)$ , we have that

$$_{F}\Psi_{\kappa}(\mathscr{P})=g[d]^{\epsilon}, \text{ where } e=(p-1)/ge_{1}d.$$

**Proof.** The discriminant of f(x) over  $\mathcal{Q}^{(e_1)}$  is  $\mathcal{P}_1^{((p-1)/e_1)-1}$ . Since  $\mathcal{P}^{a_1} \| \mathcal{P}_1, a_1 = a/e_1$ , we have that the discriminant of f(x) over F is exactly divisible by  $\mathcal{P}^{(a_1(p-1)/e_1)-a_1}$ . If

$$f(\mathbf{x}) \equiv \prod_{i=1}^{g} f_i(\mathbf{x}) \pmod{\mathcal{P}^{a_1(p-1)/e_1}},$$

where the  $f_i(x)$  are irreducible modulo  $\mathcal{P}^{(a_1(p-1)/e_1)+1}$ , then

(4.1) 
$$f(x) = \prod_{i=1}^{8} \bar{f}_{i}(x)$$

in  $F_{\mathcal{P}}$ , [24, pg. 90], where  $\overline{f}_i(x)$  is irreducible in  $F_{\mathcal{P}}$  and deg  $\overline{f}_i(x) = (p-1)/e_1g$ , for all *i*. Set  $\mathcal{L}' = F_{\mathcal{P}} \cap \mathcal{Q}_p(\zeta_p)$ . Since deg  $\overline{f}_i(x) = (p-1)/e_1g$ , we have that  $[\mathcal{L}': \mathcal{Q}_p] = e_1g$ . Furthermore,  $e(\mathcal{Q}_p(\zeta_p)|\mathcal{Q}_p) = p-1$ , hence  $e(\mathcal{L}'|\mathcal{Q}_p) = e_1g$  and  $e(\mathcal{Q}_p(\zeta_p)|\mathcal{L}') = (p-1)/e_1g$ . Since  $((p-1)/e_1g, p) = 1$ , we can apply Theorem 4.1 and we obtain that

$$(4.2) e(F_{\mathscr{P}}(\zeta_p)|F_{\mathscr{P}}) = (p-1)/e_1gd.$$

On putting (4.1) and (4.2) together, we have that  $\mathcal{P}$  factors in  $F(\zeta_p)$  into g distinct prime ideals of relative degree d, and relative multiplicity  $e = (p-1)/e_1 g d$ . That is; we have

$$F^{\Psi}K^{(\mathscr{P})} = g[d]^{\epsilon}.$$

LEMMA 4.3. Let  $x^p - \mu$  be irreducible over F,  $\mu$  an integer,  $\mu = \mathscr{P}^{\nu}\mathscr{C}$ ,  $(\mathscr{P}, \mathscr{C}) = 1$ . If  $p \not\mid \nu$ , then  $\mathscr{P}$  becomes the pth-power of a prime ideal in  $F(\mu^{1/p})$ . If  $p \mid \nu$ , then we can find an integer  $\mu_1$  such that  $(\mu_1, \mathscr{P}) = 1$  and  $F(\mu^{1/p}) = F(\mu^{1/p})$ .

**Proof.** We first find a  $\rho \in F$  such that  $\rho$  has ideal denominator  $\mathscr{P}$ . To find  $\rho$  we first determine an ideal  $C_1$  so that  $\mathscr{P}C_1 = (\alpha)$ . Next

determine an ideal  $C_2$  so that  $C_1C_2 = (\beta)$  and  $(C_2, \mathcal{P}) = 1$  [15, 1955, *Theorem* 5.11]. Then  $\rho = \beta/\alpha$  has the desired property.

If  $p \not\prec \nu$ , then we can write  $\nu x - py = 1$ . Set  $\mu_1 = \mu^x \rho^{yp}$ . Then  $\mu_1$  is an integer,  $F(\mu^{1/p}) = F(\mu_1^{1/p})$ , and  $\mathcal{P} \| \mu_1$ . Hence  $(\mathcal{P}, \sqrt[y]{\mu_1})^p = \mathcal{P}$ , so  $\mathcal{P}$  becomes the *p*th-power of a prime ideal in  $F(\mu^{1/p})$ .

If  $p \mid \nu$ , set  $\mu_1 = \mu \rho^{\nu}$ . Then  $\mu_1$  is an integer prime to  $\mathscr{P}$  and  $F(\mu^{1/p}) = F(\mu^{1/p})$ .

Because of Lemma 4.3 we may assume that  $(\mu, \mathcal{P}) = 1$ .

LEMMA 4.4. Let  $x^p - \mu$  be irreducible over F,  $(\mu, \mathcal{P}) = 1$ . Then the ideal  $\mathcal{P}$  has more than one factor in  $F(\mu^{1/p})$  iff  $\mu \equiv \xi^p \pmod{\mathcal{P}^{a+N+1}}$ , where  $\mathcal{P}^a \| (p)$  and N = [a/p - 1].

**Proof.** From Theorem 3.2 we have that  $\mu = \alpha^p$  in  $F_{\mathscr{P}}$  iff  $\mu \equiv \xi^p \pmod{\mathscr{P}^{a+N+1}}$ . But the number of relatively prime factors of  $\mathscr{P}$  in  $F(\mu^{1/p})$  is equal to the number of distinct prime factors of  $x^p - \mu$  in  $F_{\mathscr{P}}$ , and  $x^p - \mu$  is reducible in  $F_{\mathscr{P}}$  iff  $\mu = \alpha^p$  in  $F_{\mathscr{P}}$ . Hence  $\mathscr{P}$  has at least two factors iff  $\mu \equiv \xi^p \pmod{\mathscr{P}^{a+N+1}}$ .

If  $\zeta_p \in F_{\mathscr{P}}$  then  $a = sp^{k-1}(p-1)$  and  $-p \equiv g^{p-1}\pi^a \pmod{\mathscr{P}^{a+1}}$ . As before, we set  $\eta' = 1 + g'\pi^{sp^k}$ , where g' is chosen so that  $h(x) = x^p - g^{p-1}x - g'$  has no solution modulo  $\mathscr{P}$ . Furthermore  $x^p - g^{p-1}x - g'$ is irreducible modulo  $\mathscr{P}$  and so h(x) is irreducible in F. We also point out that  $a + N = a + (a/p - 1) = sp^k$ .

LEMMA 4.5. The ideal  $\mathcal{P}$  remains prime in  $F((\eta')^{1/p})$ .

*Proof.* By Lemma 2.2,  $\eta' \neq \xi^p \pmod{\mathcal{P}^{a+N+1}}$ , so  $\mathcal{P}$  has only one factor in  $F((\eta')^{1/p})$ .

Let  $\alpha$  be a root of h(x) and consider  $F(\alpha)$ . The different of  $\alpha$  is  $(p\alpha^{p-1}-g^{p-1})$ , which is prime to  $\mathcal{P}$  since g is prime to  $\mathcal{P}$ . Hence  $\mathcal{P}$  is not ramified in  $F(\alpha)$ . However, we have that

$$(1 + \alpha \pi^{sp^{k-1}})^p \equiv 1 + p\alpha \pi^{sp^{k-1}} + \alpha^p \pi^{sp^k} \equiv 1 + (\alpha^p - g^{p-1}\alpha)\pi^{sp^k}$$
$$\equiv 1 + g'\pi^{sp^k} \equiv \eta' \pmod{\mathcal{P}^{sp^{k+1}}}.$$

If  $\mathfrak{P}$  is any prime divisor of  $\mathscr{P}$  in  $F(\alpha)$ , then  $\mathfrak{P}^{\mathfrak{a}} ||(p)$  and

$$(1+\alpha\pi^{sp^{k-1}})^p \equiv \eta' \pmod{\mathfrak{P}^{a+N+1}}.$$

Hence  $(\eta')^{1/p} \in F(\alpha)_{\mathfrak{P}} = F_{\mathscr{P}}(\alpha)$ , which implies that

$$F_{\mathcal{P}}(\alpha) = F_{\mathcal{P}}((\eta')^{1/p})$$

is an unramified extension, so  $\mathcal{P}$  remains prime in  $F((\eta')^{1/p})$ .

From the proof we also have the following result.

LEMMA 4.6. The field  $F_{\mathscr{P}}(\alpha) = F_{\mathscr{P}}((\eta')^{1/p})$  is an unramified extension of  $F_{\mathcal{P}}$ , where  $\alpha$  is a root of  $x^{p} - g^{p-1}x - g'$ .

LEMMA 4.7. If  $x^p - \mu$  is irreducible over F and  $\zeta_p \notin F_{\mathcal{P}}$ , then  $\mathcal{P}$  never remains a prime ideal in  $F(\mu^{1/p})$ .

*Proof.* If  $\mathcal{P}^{\nu} \parallel \mu$ ,  $(\nu, p) = 1$ , then  $\mathcal{P} = \mathfrak{P}^{p}$  in  $F(\mu^{1/p})$ . If  $(\nu, p) = p$ then we may assume that  $(\mu, \mathcal{P}) = 1$ .

Assume that  $\mathscr{P}$  remains prime in  $F(\mu^{1/p})$ , then  $x^p - \mu$  is irreducible over  $F_{\mathcal{P}}$  and  $F_{\mathcal{P}}(\mu^{1/p})$  is a normal, unramified extension of  $F_{\mathcal{P}}$  by Lemma 4.2. Hence  $\zeta_p \in F_{\mathcal{P}}(\mu^{1/p})$ . But this implies that  $[F_{\mathcal{P}}(\zeta_p):F_{\mathcal{P}}]|p$ , since  $p = [F_{\mathscr{P}}(\mu^{1/p}): F_{\mathscr{P}}].$  However  $([F_{\mathscr{P}}(\zeta_p): F_{\mathscr{P}}], p) = 1$ , so  $[F_{\mathscr{P}}(\zeta_p): F_{\mathscr{P}}] = 1$ , which implies that  $\zeta_p \in F_{\mathcal{P}}$ , and this contradicts the assumption that  $\zeta_p \notin F_{\mathcal{P}}$ . Hence  $\mathcal{P}$  does not remain prime.

LEMMA 4.8. Let  $[F(\mu^{1/p}): F] = p$ , then  $F(\mu^{1/p}) = F(\mu_1^{1/p})$  iff  $\mu_1 =$  $\beta^{p}\mu^{x}$ , (x, p) = 1,  $\beta \in F$ .

*Proof.* See the paper by Schinzel, pg. 163.

THEOREM 4.3. Let  $\mathcal{P}^{a} \| (p)$  in  $F, F \cap \mathcal{Q}(\zeta_{p}) = \mathcal{Q}^{(e_{1})}, x^{p} - \mu$  irreducible over F,  $(\mu, \mathcal{P}) = 1$ , and  $N = \lfloor a/p - 1 \rfloor$ .

(1) If  $\mu \equiv \xi^p \pmod{\mathcal{P}^{a+N+1}}$ , then

$$_{F}\Psi_{K}(\mathscr{P}) = 1[1] + e_{1}g[d]^{e}, \qquad K = F(\mu^{1/p}),$$

where

$$_{F}\Psi_{K_{1}}(\mathscr{P})=g[d]^{\epsilon}, \qquad K_{1}=F(\zeta_{p}).$$

Furthermore, if  $\mathfrak{P}$  is a factor of degree d, then  $F(\mu^{1/p})_{\mathfrak{P}} = F_{\mathfrak{P}}(\zeta_p)$ .

(2) If a + N > 1, (1) is not solvable, and  $\mu \equiv \xi^p \pmod{\mathcal{P}^{a+N}}$ , then  $\zeta_p \in F_{\mathscr{P}} \text{ and }_F \Psi_K(\mathscr{P}) = \mathbb{1}[p].$ 

(3) If a + N > 1,  $\mu \neq \xi^p \pmod{\mathcal{P}^{a+N}}$ , then  $_F \Psi_K(\mathcal{P}) = 1[1]^p$ .

(4) If a + N = 1,  $\mu \neq \xi^p \pmod{\mathcal{P}^2}$ , then  ${}_F \Psi_K(\mathcal{P}) = 1[1]^p$ .

*Proof.* Since  $(\mu, \mathcal{P}) = 1$ , we have that  $\mu^{p^{t-1}} \equiv 1 \pmod{p}$  where  $N(\mathcal{P}) = p^{f}$ . Since  $(p^{f} - 1, p) = 1$ , we have that  $F(\mu^{1/p}) = F((\mu^{p^{f-1}})^{1/p})$ . Hence, we may assume that  $\mu \equiv 1 \pmod{\mathcal{P}}$ .

(1) If  $\mu \equiv \xi^p \pmod{\mathcal{P}^{a+N+1}}$ , we have that  $\mu = \alpha^p$  in  $F_{\mathcal{P}}$  by Theorem 3.2. Hence  $x^p - \mu = x^p - \alpha^p = (x - \alpha)$ .  $\prod_{i=1}^{e_{ig}} f_i(x)$  in  $F_{\mathcal{P}}$  where  $\deg f_i(x) = (p-1)/e_1g$ , each  $f_i(x)$  is irreducible in  $F_{\mathcal{P}}$ , and  $\zeta_p^{i(i)}\alpha$ , (j(i), p) = 1, is a root of  $f_i(x)$ , for each *i*. By Theorem 4.2, we have that  $e(F_{\mathcal{P}}(\zeta_p^{i(i)}\alpha)|F_{\mathcal{P}}) = e$ , where  $e = (p-1)/ge_1d$ ,  $d = (a/e_1g, (p-1)/e_1g)$ .

Therefore, corresponding to the linear factor  $x - \alpha$  we have an ideal factor of  $\mathcal{P}$  in  $F(\mu^{1/p})$  of relative degree and multiplicity 1. Corresponding to each of the  $e_1g$  polynomials  $f_i(x)$ ,  $\mathcal{P}$  has an ideal factor of relative degree d and multiplicity e. Hence

$$_{F}\Psi_{K}(\mathcal{P})=1[1]+e_{1}g[d]^{e}.$$

Furthermore, if  $\mathfrak{P}$  is any prime factor of  $\mathscr{P}$  in  $F(\mu^{1/p})$  of relative degree d, then  $\mathfrak{P}$  corresponds to one of the  $f_i(x)$ . But a root of  $f_i(x)$  is  $\zeta_p^{1(i)}\alpha$ , (j(i), p) = 1. Hence  $F_{\mathscr{P}}(\zeta_p^{1(i)}\alpha) = F_{\mathscr{P}}(\zeta_p)$ . So  $F(\mu^{1/p})_{\mathfrak{P}} = F_{\mathscr{P}}(\zeta_p)$ .

(2) We first show that if  $\zeta_p \notin F_{\mathscr{P}}$  and  $\mu \equiv \xi^p \pmod{\mathscr{P}^{a+N}}$ , a+N > 1, then  $\mu \equiv \xi_1^p \pmod{\mathscr{P}^{a+N+1}}$ . By Theorem 2.2,  $\{\eta_{ij} \mid i = 1, \dots, f; j = 1, \dots, a\}$  is a basis for  $G_m$ ,  $m \ge a+N > 1$ . But if  $\mu \equiv \xi^p \pmod{\mathscr{P}^{a+N}}$ , then  $\mu \equiv \prod \eta_{ij}^{b_{ij}} \pmod{\mathscr{P}^{a+N}}$  and  $p \mid b_{ij}$ , for all i, j. If  $\mu \equiv \prod \eta_{ij}^{b_{ij}} \pmod{\mathscr{P}^{a+N+1}}$ , then  $b'_{ij} = b_{ij} + pc_{ij}$ , hence  $p \mid b'_{ij}$  and  $\mu \equiv \xi_1^p \pmod{\mathscr{P}^{a+N+1}}$ .

Assume that a + N > 1, (1) is not solvable, and  $\mu \equiv \xi^{p} \pmod{\mathcal{P}^{a+N}}$ . Then  $\zeta_{p} \in F_{\mathcal{P}}$ . Furthermore, by Lemma 4.4,  $\mathcal{P}$  has only one factor in  $F(\mu^{1/p})$ .

By Theorems 2.2 and 2.3, we have that  $\{\eta_{ij} | i = 1, \dots, f, j = 1, \dots, a\}$  is a basis for  $G_{a+N}$ , and  $\{\eta_{ij} | i = 1, \dots, f, j = 1, \dots, a, \eta'\}$  is a basis for  $G_{a+N+1}$ . Hence,

(4.3) 
$$\mu \equiv \prod \eta_{\eta}^{b_{\eta}} \cdot \eta'^{b} \pmod{\mathscr{P}^{a+N+1}},$$

and

$$\mu \equiv \prod \eta_u^{b_u} \equiv \xi^p \pmod{\mathcal{P}^{a+N}}.$$

So  $p \mid b_{y}$ , for all *i*, *j*, and (b, p) = 1. We can rewrite (4.3) as

$$\mu \cdot \eta'^{-b} \equiv \xi_1^p \pmod{\mathcal{P}^{a+N+1}},$$

so  $\mu = \alpha^{p} \cdot \eta'^{b}$  in  $F_{\mathcal{P}}$ . Hence  $F_{\mathcal{P}}(\mu^{1/p}) = F_{\mathcal{P}}(\eta'^{1/p})$  is an unramified extension of  $F_{\mathcal{P}}$  by Lemma 4.5. So  $\mathcal{P}$  remains prime in  $F(\mu^{1/p})$ , that is

$$_{F}\Psi_{K}(\mathcal{P})=1[p].$$

(3) If a + N > 1, and  $\mu \neq \xi^{p} \pmod{\mathcal{P}^{a+N}}$ , then  $\mathcal{P}$  either remains prime or becomes the *p*th power of a prime ideal.

Assume  $\mathscr{P}$  remains prime. Then  $\zeta_p \in F_{\mathscr{P}}$  by Lemma 4.7, and  $F_{\mathscr{P}}(\mu^{1/p}) = F_{\mathscr{P}}((\eta')^{1/p})$ . But this implies that  $\mu = \xi^p \eta'^b$ , (b, p) = 1, by Lemma 4.8. Recall that  $\eta' = 1 + g' \pi^{\mathfrak{s}^k}$  and  $sp^k = a + N$ , so  $\eta' \equiv 1 \pmod{\mathfrak{P}^{a+N}}$ , hence we have that  $\mu \equiv \xi^p \pmod{\mathfrak{P}^{a+N}}$ , contrary to assumption. Hence,  $\mathscr{P}$  becomes the *p*th power of a prime ideal in  $F(\mu^{1/p})$  and  ${}_F\Psi_K(\mathscr{P}) = 1[1]^p$ .

(4) If a = 1 and N = 0, then a + N + 1 = 2 and  $\zeta_p \notin F_{\mathscr{P}}$ . If  $\mu \notin \xi^p \pmod{\mathscr{P}^2}$ , then  $\mathscr{P}$  either remains prime or becomes the *p*th power of a prime ideal. But since  $\zeta_p \notin F_{\mathscr{P}}$ ,  $\mathscr{P}$  cannot remain prime, so  $_F \Psi_{\kappa}(\mathscr{P}) = 1[1]^p$ .

**REMARK.** Theorem 4.3 could have been proven without the results in §2. In fact, the proof in Hecke [4, pp. 148–154] generalizes to prove this theorem. However, it is our belief that this proof gives more insight into the theorem and shows why a + N is the natural division between splitting and remaining prime.

We now specialize to  $F = \mathcal{Q}$ . Of course, the prime ideals correspond to the prime numbers and  $\zeta_p \notin \mathcal{Q}_p$  iff  $p \neq 2$ . Furthermore a = 1. So N = 0 if p > 2 and N = 1 if p = 2.

COROLLARY 1. Let p = 2,  $x^2 - \mu$  irreducible over  $\mathcal{Q}$ ,  $(\mu, 2) = 1$ , and  $K = \mathcal{Q}(\mu^{1/2})$ .

(1) If  $\mu \equiv \xi^2 \pmod{2^3}$ , then  $_F \Psi_K(2) = 2[1]$ .

(2) If (1) is not solvable,  $\mu \equiv \xi^2 \pmod{2^2}$ , then  $_F \Psi_K(2) = 1[2]$ .

(3) If  $\mu \neq \xi^2 \pmod{2^2}$ , then  $_F \Psi_K(2) = 1[1]^2$ .

COROLLARY 2. Let  $p \neq 2$  and  $x^p - \mu$  irreducible over  $\mathcal{Q}$ ,  $(\mu, p) = 1$ . (1) If  $\mu \equiv \xi^p \pmod{p^2}$ , then  $p = \mathcal{P}_1 \cdot \mathcal{P}_2^{p^{-1}}$ , where the degree of  $\mathcal{P}_i$  is 1, for i = 1, 2. Furthermore,  $\mathcal{Q}(\mu^{1/p})_{\mathcal{P}_1} = \mathcal{Q}_p$  and  $\mathcal{Q}(\mu^{1/p})_{\mathcal{P}_2} = \mathcal{Q}_p(\zeta_p)$ . (2) If  $\mu \neq \xi^p \pmod{p^2}$ , then  $(p) = \mathcal{P}^p$  in  $\mathcal{Q}(\mu^{1/p})$ .

Corollary 1 is well known [15, 1955, Chapter 8]. Corollary 2 is not so well known. Dedekind [2, page 156] proved this corollary for p = 3. More recently we found this result in a paper by Westlund [23].

The Supporting Institutions listed above contribute to the cost of publication of this Journal, but they are not owners or publishers and have no responsibility for its contents or policies.

Mathematical papers intended for publication in the Pacific Journal of Mathematics should be in typed form or offset-reproduced (not dittoed), double spaced with large margins. Underline Greek letters in red, German in green, and script in blue. The first paragraph or two must be capable of being used separately as a synopsis of the entire paper. Items of the bibliography should not be cited there unless absolutely necessary, in which case they must be identified by author and Journal, rather than by item number. Manuscripts, in duplicate, may be sent to any one of the four editors. Please classify according to the scheme of Math. Reviews, Index to Vol. 39. All other communications should be addressed to the managing editor, or Elaine Barth, University of California, Los Angeles, California, 90024.

100 reprints are provided free for each article, only if page charges have been substantially paid. Additional copies may be obtained at cost in multiples of 50.

The Pacific Journal of Mathematics is issued monthly as of January 1966. Regular subscription rate: \$72.00 a year (6 Vols., 12 issues). Special rate: \$36.00 a year to individual members of supporting institutions.

Subscriptions, orders for numbers issued in the last three calendar years, and changes of address should be sent to Pacific Journal of Mathematics, 103 Highland Boulevard, Berkeley, California, 94708.
