ON STABLE PARALLELIZABILITY OF FLAG MANIFOLDS

P. SANKARAN AND P. ZVENGROWSKI

It was shown by Trew and Zvengrowski that the only Grassmann manifolds that are stably parallelizable as real manifolds are $G_1(F^2)$, $G_1(\mathbf{R}^4) \cong G_3(\mathbf{R}^4)$, and $G_1(\mathbf{R}^8) \cong G_7(\mathbf{R}^8)$ where $F = \mathbf{R}$, C, or H, the case $F = \mathbf{R}$ having also been previously treated by several authors. In this paper we solve the more general question of stable parallelizability of F-flag manifolds, $F = \mathbf{R}$, C, or H. Only elementary vector bundle concepts are used. The real case has also been recently solved by Korbaš using Stiefel-Whitney classes.

THEOREM 1. *Let* $s \geq 3$, $\mu = (n_1, \ldots, n_s)$. *Then*

(i) $FG(\mu)$ *is stably parallelizable if* $n_1 = \cdots = n_s = 1$, *and parallelizable only when* $F = \mathbf{R}$.

(ii) *If* $n_i > 1$ *for some i then* $FG(\mu)$ *is not stably parallelizable.*

Note that the case $s = 2$ is just that of Grassmann manifolds, which is already known. In §1 the proof of Theorem 1 is given. An explicit trivialization of the tangent bundle of $\mathbf{R}G(1, \ldots, 1)$ is constructed in §2. We remark that similar questions can be asked of the "partially oriented" flag manifolds, that is manifolds of flags $(\sigma_1, \ldots, \sigma_s)$, $\dim \sigma_i = n_i$, in which some of the σ_i are oriented (cf. [5]). Results on these questions will be given in a later paper.

1. Proof of Theorem 1.

Proof of (i). Let $\mu = (n_1, \ldots, n_s)$ with $n_i = 1$. The stable parallelizability of $FG(\mu)$ has been noted by Lam in [4]. The parallelizability of $\mathbf{R}G(\mu) \cong O(n)/(O(1) \times \cdots \times O(1))$ is explicitly shown in §2 below. However, it can also be deduced from the theorem that the quotient of a Lie group by a finite subgroup is parallelizable (cf. [3] or [2], p. 502). To prove that $FG(\mu)$ is not parallelizable for $G = \mathbf{C}$ or $\mathbf{H}$ we show that the Euler characteristic in these cases is non-zero. Note that π_n: $FG(\mu) \to FP^{n-1} \cong FG(n-1, 1)$, the projection map that sends $(A_1, \ldots, A_n)$ to $A_n \in FP^{n-1}$, is a bundle map with fibre $FG(\mu_{s-1})$ ($\mu_{s-1} = (n_1, \ldots, n_{s-1})$).

This bundle is orientable for $F = \mathbf{C}$ or $\mathbf{H}$. Further, $\chi(FP^m) > 0$ for $F = \mathbf{C}, \mathbf{H}$ and $m \geq 1$. Using induction and the multiplicative property of Euler characteristic we see that $\chi(FG(\mu)) > 0$ for $F = \mathbf{C}$ or $\mathbf{H}$.

Proof of (ii). Since $FG(n_1, \ldots, n_s) \cong FG(n_{i_1}, \ldots, n_{i_s})$ where $\{i_1, \ldots, i_s\} = \{1, \ldots, s\}$ we assume, without loss of generality, that $n_1 \geq \cdots \geq n_s$. Now let $n_1 > 1$. By **[4]** one has the following description of the tangent bundle $\tau^F(\mu)$ of $FG(\mu)$:

$$\tau^F(\mu) \approx_{Z(F)} \bigoplus_{1 \leq i < j \leq s} \bar{\xi}_i^F(\mu) \otimes_F \xi_j^F(\mu)$$

where $\xi_i^F(\mu)$ denotes the canonical F-vector bundle of rank n_i over $FG(\mu)$ and $\bar{\xi}_i^F(\mu)$ its conjugate bundle for $1 \leq i \leq s$. Note that

$$\xi_1^F(\mu) \oplus \cdots \oplus \xi_s^F(\mu) \approx \varepsilon_n^F$$

where ε_n^F is the trivial F-vector bundle of rank n.

Now consider the inclusion i: $FG(\mu_{s-1}) \to FG(\mu)$ which is induced by the identification $F^{|\mu|} \cong F^{|\mu_{s-1}|} \oplus F^{n_s}$. Clearly

$$i^*(\xi_i^F(\mu)) \approx \xi_i^F(\mu_{s-1}) \quad \text{for } 1 \leq i \leq s-1 \quad \text{and}$$
$$i^*(\xi_s^F(\mu)) \approx \varepsilon_{n_s}^F.$$

Therefore, denoting stable equivalence of $Z(F)$-bundles by $\sim$,

$$i^*(\tau^F(\mu)) \approx i^*\Big(\bigoplus_{1 \leq i < j \leq s} \bar{\xi}_i^F(\mu) \otimes \xi_j^F(\mu)\Big)$$

$$\approx \bigoplus_{1 \leq i < j \leq s-1} \bar{\xi}_i^F(\mu_{s-1}) \otimes \xi_j^F(\mu_{s-1}) \bigoplus_{1 \leq i \leq s-1} \bar{\xi}_i^F(\mu_{s-1}) \otimes \varepsilon_{n_s}^F$$

$$\sim \tau^F(\mu_{s-1}) \quad \text{since} \bigoplus_{1 \leq i \leq s-1} \bar{\xi}_i^F(\mu_{s-1}) \approx \bar{\varepsilon}_{|\mu_{s-1}|}^F.$$

Let j be the composition of the inclusions

$$FG(\mu_2) \xrightarrow{i} \cdots \xrightarrow{i} FG(\mu).$$

By applying i^* successively, we obtain

$$j^*(\tau^F(\mu)) \sim \tau^F(\mu_2).$$

Now the conclusion of Theorem 1(ii) follows from the negative results on the stable parallelizability of Grassmann manifolds except when $F = \mathbf{R}$, $n_2 = 1$ and $n_1 = 3$ or 7 (see **[6]**).

We now consider the double covering

$$PV_{\mathbf{R}}(n,2) \xrightarrow{p} \mathbf{R}G(n-2,1,1)$$

where $PV_{\mathbf{R}}(n,k)$ is the projective Stiefel manifold obtained by identifying a with $-a$ for $a \in V_{n,k}$, $n \geq k \geq 1$. If $[\underline{a}] \in PV_{\mathbf{R}}(n,2)$, where $\underline{a} = (a_1, a_2) \in V_{n,2}$,

$$p([\underline{a}]) = \left(\{a_1, a_2\}^{\perp}, \mathbf{R}a_1, \mathbf{R}a_2\right) \in \mathbf{R}G(n-2,1,1).$$

As for any covering map, we have

$$p^*\left(\tau^{\mathbf{R}}(n-2,1,1)\right) \approx \tau\left(PV_{\mathbf{R}}(n,2)\right).$$

From the results of Antoniano **[1]** we know that $PV_{\mathbf{R}}(5,2)$ and $PV_{\mathbf{R}}(9,2)$ are not stably parallelizable. Consequently $\tau^{\mathbf{R}}(3,1,1)$ and $\tau^{\mathbf{R}}(7,1,1)$ are not stably parallelizable, completing the proof in all cases.

REMARK. The top Chern class of $\mathbf{C}G(1,\ldots,1)$ is its Euler class. Since the Euler characteristic of $\mathbf{C}G(1,\ldots,1)$ is non-zero it follows that the top Chern class of $\tau^{\mathbf{C}}(1,\ldots,1)$ is non-zero. Hence $\mathbf{C}G(1,\ldots,1)$ is not stably parallelizable as a complex manifold.

2. Parallelizability of $\mathbf{R}G(1,\ldots,1)$. We conclude this paper by constructing an explicit trivialization for $\tau^{\mathbf{R}}(1,\ldots,1)$.

For each pair of integers k and l, $1 \leq k < l \leq n$, we will construct a tangent vector field φ_{kl} and show that these $\binom{n}{2}$ vector fields are everywhere linearly independent. Since $\dim \mathbf{R}G(1,\ldots,1) = \binom{n}{2}$, the space is therefore parallelizable.

Let $\underline{a} = ([a_1],\ldots,[a_n]) \in \mathbf{R}G(1,\ldots,1)$ where $\{a_1,\ldots,a_n\}$ is an orthonormal basis for $\mathbf{R}^n$, and $[a_i] = [-a_i] = \{a_i, -a_i\}$. Define φ_{kl} as follows: Writing $a_i = (a_{i1},\ldots,a_{in}) \in \mathbf{R}^n$ for $1 \leq i \leq n$,

$$\varphi_{kl}(\underline{a}) = \sum_{1 \leq i < j \leq n} (a_{ik}a_{jl} - a_{il}a_{jk}) a_i \otimes a_j, \qquad 1 \leq k < l \leq n.$$

It is clear that φ_{kl}: $\mathbf{R}G(1,\ldots,1) \to T^{\mathbf{R}}(1,\ldots,1)$, the total space of the tangent bundle $\tau^{\mathbf{R}}(1,\ldots,1) \approx \oplus_{1 \leq i < j \leq n} \xi_i \otimes \xi_j$ is well-defined and continuous.

Now consider the homomorphism f: $\oplus_{1 \leq i < j \leq n} A_i \otimes A_j \to \Lambda^2(\mathbf{R}^n)$ defined by

$$f(a_i \otimes a_j) = a_i \wedge a_j$$

where $A_i = \mathbf{R}a_i$. Since $\{a_1,\ldots,a_n\}$ is an orthonormal basis for $\mathbf{R}^n$, $\{a_i \wedge a_j \mid 1 \leq i < j \leq n\}$ is an orthonormal basis for $\Lambda^2(\mathbf{R}^n)$. Therefore f

preserves inner products and is an isomorphism. Now

$$f\varphi_{kl}(\underline{a}) = \sum_{1 \le i < j \le n} (a_{ik}a_{jl} - a_{jk}a_{il}) a_i \wedge a_j = u_k \wedge u_l$$

where $u_k = \sum a_{ik} a_i = \sum a_{ik} a_{im} e_m = \sum \delta_{km} e_m = e_k$, $\{e_1, \ldots, e_n\}$ being the standard orthonormal basis of $\mathbf{R}^n$. Therefore

$$\{f\varphi_{kl}(\underline{a}) \mid 1 \le k < l \le n\} = \{e_k \wedge e_l \mid 1 \le k < l \le n\}$$

is an orthonormal basis for $\Lambda^2(\mathbf{R}^n)$. Consequently $\{\varphi_{kl}(\underline{a}) \mid 1 \le k < l \le n\}$ is an orthonormal basis for the tangent space at $\underline{a}$ to $\mathbf{R}G(1, \ldots, 1)$. Since $\underline{a} \in \mathbf{R}G(1, \ldots, 1)$ was arbitrary, it follows that $\{\varphi_{kl} \mid 1 \le k < l \le n\}$ is everywhere linearly independent.

Mathematical papers intended for publication in the *Pacific Journal of Mathematics* should be in typed form or offset-reproduced (not dittoed), double spaced with large margins. Please do not use built up fractions in the text of the manuscript. However, you may use them in the displayed equations. Underline Greek letters in red, German in green, and script in blue. The first paragraph must be capable of being used separately as a synopsis of the entire paper. In particular it should contain no bibliographic references. Please propose a heading for the odd numbered pages of less than 35 characters. Manuscripts, in triplicate, may be sent to any one of the editors. Please classify according to the scheme of Math. Reviews, Index to Vol. 39. Supply name and address of author to whom proofs should be sent. All other communications should be addressed to the managing editor, or Elaine Barth, University of California, Los Angeles, California 90024.

There are page-charges associated with articles appearing in the Pacific Journal of Mathematics. These charges are expected to be paid by the author's University, Government Agency or Company. If the author or authors do not have access to such Institutional support these charges are waived. Single authors will receive 50 free reprints; joint authors will receive a total of 100 free reprints. Additional copies may be obtained at cost in multiples of 50.

The *Pacific Journal of Mathematics* is issued monthly as of January 1966. Regular subscription rate: $190.00 a year (5 Vols., 10 issues). Special rate: $95.00 a year to individual members of supporting institutions.

Subscriptions, orders for numbers issued in the last three calendar years, and changes of address should be sent to Pacific Journal of Mathematics, P.O. Box 969, Carmel Valley, CA 93924, U.S.A. Old back numbers obtainable from Kraus Periodicals Co., Route 100, Millwood, NY 10546.

The Pacific Journal of Mathematics at P.O. Box 969, Carmel Valley, CA 93924 (ISSN 0030-8730) publishes 5 volumes per year. Application to mail at Second-class postage rates is pending at Carmel Valley, California, and additional mailing offices. Postmaster: Send address changes to Pacific Journal of Mathematics, P.O. Box 969, Carmel Valley, CA 93924.
