#### LINES HAVING HIGH CONTACT WITH A PROJECTIVE VARIETY

**George Jennings** 

Let 
$$\mathscr{U}$$
 open  $\subset \mathbf{P}^n = \mathbf{P}^n(\mathbf{C}), X \subset \mathscr{U}$  an analytic subvariety,  

$$J = \{(p, l) \in \mathbf{P}^n \times \mathbf{G}(1, n) | p \in l\}$$

$$\pi \swarrow \qquad \searrow \lambda$$

$$\mathbf{P}^n \qquad \mathbf{G} = \mathbf{G}(1, n),$$

the incidence correspondence with induced projections  $\pi$ ,  $\lambda$ , where G = G(1, n) is the Grassmannian of lines in  $P^n$ .

## **0.** Definition. The contact cones of X are $C^{r} = \left\{ (p, l) \in \pi^{-1} \mathscr{U} | l \text{ has contact} \ge r + 1 \text{ with } X \text{ at } p \right\}$ $C^{\infty} = \bigcap_{r=0}^{\infty} C^{r}.$

The contact cones may be thought of as schemes of cones in the tangent space of  $\mathbf{P}^n$  which reflect the local geometry of the embedding  $X \to \mathscr{U}$ . The main results of this paper are a singularities theorem (13) which puts an upper bound on the pathology of the contact cones if X is not ruled, and an algebraization theorem (17) which says roughly that if X is a hypersurface whose contact cones resemble those of an algebraic hypersurface of low degree then X is algebraic. Hypersurfaces are the simplest case—in a future paper we show that in general hypersurfaces are determined up to projective equivalence by the projective moduli of the third contact cone with a little help from the ideal of the fourth.

The contact cones have a scheme structure defined in terms of the functor of principal parts (jets)  $\mathscr{P}_{J/G}^r$  [5, §16]. Let  $\mathscr{F}$  be a sheaf of  $\mathscr{O}_J$ -modules. Form the fiber product  $J \times_G J$ . Let  $\mathscr{I}_\Delta$  be the ideal sheaf of the diagonal, and  $J^r \xrightarrow{\Delta^r} J \times_G J$  the subscheme defined by  $\mathscr{I}_{\Delta}^{r+1}$ . One has a commutative diagram

$$J'$$

$$p' \swarrow \qquad \downarrow \Delta' \qquad \searrow q'$$

$$J \quad \stackrel{p}{\leftarrow} \quad J \times_{\mathbf{G}} J \quad \stackrel{q}{\rightarrow} \quad J$$

where p, q are the projections. Then

$$\mathscr{P}_{J/\mathbf{G}}^{r}\mathscr{F} = q_{*}^{r}p^{r}*\mathscr{F} \cong \mathscr{F} \otimes_{\mathscr{O}_{J}} \mathscr{P}_{J/\mathbf{G}}^{r}\mathscr{O}_{J}.$$

 $\mathcal{P}_{J/G}^r \mathcal{O}_J$  is a locally free sheaf of rank r + 1 consisting of relative r jets of sections of  $\mathcal{O}_I$ .

Let  $\mathscr{I}_X \subset \mathscr{O}_{\mathscr{U}}$  be the ideal sheaf of X.

**1. Definition.**  $C', 0 \le r < \infty$ , is the zero scheme of the sheaf of sections  $\mathscr{P}_{J/G}^r(\pi^*\mathscr{I}_X) \subset \mathscr{P}_{J/G}^r \mathscr{O}_J | \mathscr{U}. C^{\infty} = \bigcap_{r=0}^{\infty} C^r$  is the intersection scheme.  $C_p^r = \pi^{-1}(p) \cap C', 0 \le r \le \infty$ , is the fiber over  $p \in \mathscr{U}$ .

Since  $J \times_G J \xrightarrow{\pi \times \pi} \mathbf{P}^n \times \mathbf{P}^n$  is the blow up of  $\mathbf{P}^n \times \mathbf{P}^n$  along the diagonal the exceptional divisor J is naturally isomorphic to the projectivized tangent space  $PT\mathbf{P} \to \mathbf{P}^n$ , via the relation "v is tangent to l". In particular the relative cotangent sheaf  $\Omega^1_{J/G} \cong \mathscr{I}_{\Delta}/\mathscr{I}_{\Delta}^2$  of J is just the dual  $\mathscr{O}_T(1)$  of the universal subbundle  $\mathscr{O}_T(-1)$  of  $\pi^*T\mathbf{P}$  over  $PT\mathbf{P}$ .  $J \cong \operatorname{Proj}(S \cdot \Omega^1_{J/G} \mathbf{P})$  where  $S \cdot \Omega^1_{J/G}$  is the sheaf of graded rings

$$S \, \Omega^1_{J/\mathbf{G}} \cong \mathcal{O}_J \oplus \mathscr{I}_\Delta / \mathscr{I}_\Delta^2 \oplus \mathscr{I}_\Delta^2 / \mathscr{I}_\Delta^3 \oplus \cdots$$

There is an (additive) sheaf homomorphism  $d_{J/G}^r: \mathcal{O}_J \to \mathcal{P}_{J/G}^r \mathcal{O}_J$  induced by the corresponding map on sections [5, p. 16]. One has a commutative diagram

over  $\pi^{-1}\mathscr{U}$  arising directly from the definition. Define contact ideal sheaves  $\mathscr{J}_X^r \subset S \cdot \Omega^1_{J/G}|_{\pi^{-1}\mathscr{U}}$  inductively by

$$\mathcal{J}_{X}^{0} = \pi^{*} \mathcal{J}_{X} \otimes_{\mathcal{O}_{J}} S \Omega_{J/G}^{1}$$
$$\mathcal{J}_{X}^{r} = \mathcal{J}_{X}^{r-1} + \iota^{-1} (d_{J/G}^{r} (\pi^{*} \mathcal{J}_{X}) + \ker \rho) \otimes_{\mathcal{O}_{J}} S \Omega_{J/G}^{1}$$
$$\mathcal{J}_{X}^{\infty} = \sum_{r=0}^{\infty} \mathcal{J}_{X}^{r}$$

on  $\pi^{-1}\mathcal{U}$ .  $\mathscr{J}_X^r$  is the ideal sheaf of  $C^r$  in  $S \Omega^1_{J/G}$ .

This leads to a convenient version in coordinates. Let  $x = (x_1, \ldots, x_n)$  be an *affine* coordinate system on  $\mathcal{U}$ ,  $dx = (dx_1, \ldots, dx_n)$ ,  $p \in \mathcal{U}$ ,  $g \in \mathcal{O}_{p,\mathcal{U}}$ . Expand in a power series

(9) 
$$g(x(p) + t) = g^{0}(x) + g^{1}(x;t) + g^{2}(x;t) + \cdots$$

where  $t = (t_1, ..., t_n)$  are indeterminants and g'(x; t) is the rth order term. Replacing t by dx,

(10) 
$$\mathscr{J}_X^r = \left(g^s(x; dx) \mid 0 \le s \le r, g \in \mathscr{I}_X\right)$$

in coordinates.

The geometry of the contact cones is controlled by the "derivative relation":

(11) 
$$\frac{\partial g^{r}(x;t)}{\partial x_{i}} = \frac{\partial g^{r+1}(x;t)}{\partial t_{i}}, \quad i = 1, \dots, n,$$

in coordinates (see [5, p. 43] for a coordinate free version).

12. PROPOSITION. If  $\mathscr{J}_X^r = \mathscr{J}_X^{r+1}$  for some r then  $\mathscr{J}_X^r = \mathscr{J}_X^{\infty}$ , so  $\pi C^r \subset X$  is ruled (by line segments).

*Proof.* Let  $g_1, \ldots, g_m$  generate  $\mathscr{I}_X$  over  $\mathscr{U}$ . By hypothesis there exists a local relation

$$g_i^{r+1}(x;t) = \sum_{j=1}^{m} \sum_{s=0}^{r} a_{ijs}(x;t) g_j^s(x;t), \qquad i = 1, \dots, m$$

Differentiate with respect to  $x_{\lambda}$  and apply the derivative relation (11):

$$\frac{\partial g_i^{r+2}}{\partial t_{\lambda}} \equiv \sum_{j=1}^m \sum_{s=0}^r a_{ijs} \frac{\partial g_j^{s+1}}{\partial t_{\lambda}} \mod \mathscr{J}_X^r,$$

 $\lambda = 1, ..., n$ . Multiply by  $t_{\lambda}$ , sum over  $\lambda$ , and apply the Euler relation:

$$(r+2)g^{r+2} \equiv 0 \mod \mathscr{J}_X^{r+1}.$$

Continue inductively. Since  $\pi C^{\infty}$  is obviously ruled we are done. (Of course  $C^{r}$  may be empty.)

EXAMPLE. If  $X \subset \mathbf{P}^n$  is algebraic of degree d then  $\mathscr{J}_X^d = \mathscr{J}_X^\infty$ . A partial converse is Theorem (17).

The tangent cone  $TY \subset TJ|_Y$  of a subscheme  $Y \subset J$  is the locus of tangent vectors annihilating the ideal of Y. In particular

$$TC_p^r = (\ker \pi_*) \cap TC^r |_{C_p^r}$$

where  $C_p^r = \pi^{-1}(p) \cap C^r$  and  $\pi_*: TJ \to \pi^*T\mathbf{P}$  is the differential.

 $\pi C_p^r \subset \mathscr{U}$  is a cone with vertex at p. Identify  $T_{p,l}C_p^r$  with the corresponding plane in  $\mathbf{P}^n$  tangent to  $\pi C_p^r$  along l. In local coordinates (9)  $T_{p,l}C_p^r$  is the plane through x(p) cut out by the hyperplanes

$$\sum \frac{\partial g^s(x(p);t)}{\partial t_i}(x_i - x(p)) = 0, \qquad s = 1, \dots, r, \ g \in \mathscr{I}_X.$$

Over a dense open subset  $\mathscr{W} \subset C^r$  the fibers  $T_{p,l}C_p^r$  will have locally constant dimension. We shall say that  $T_{p,l}C_p^r$  is locally constant along l if  $\lambda^{-1}(l) \cap \mathscr{W}$  is nonempty and  $T_{p,l}C_p^r$  is locally constant as a plane in  $\mathbf{P}^n$  along  $\lambda^{-1}(l) \cap \mathscr{W}$ .

It is easy to write down the condition for this to happen, using the coordinates of (9) (for a coordinate-free method, see [1, p. 10] "second fundamental form"). Let  $(\bar{x}, \bar{t})$  represent  $(p, l) \in \lambda^{-1}(l) \cap \mathcal{W}$ .  $\lambda^{-1}(l)$  is locally parametrized by  $s \mapsto (\bar{x} + s\bar{t}, \bar{t})$  for s near 0. Regarding  $T_{p,l}C_p^r$  as a subspace of  $\mathbb{C}^{n+1}$  we have a vector bundle  $T_{i,l}C_i^r$  over  $\pi^{-1}(l) \cap \mathcal{W}$ . Let  $v(s) = \sum a_i(s)\partial/\partial t_i$  be a local holomorphic section, so that

$$0 = \sum_{i} a_{i}(s) \frac{\partial g^{\nu}}{\partial t_{i}}(\bar{x} + s\bar{t}, \bar{t}), \text{ for all } g \in \mathscr{I}_{X}, \nu = 1, \dots, r,$$

identically in s.  $T_{p,l}C_p^r$  is locally constant along l iff for all such sections v the derivative

$$0 \equiv \sum_{i} a'_{i}(s) \frac{\partial g^{\nu}}{\partial t_{i}}(\bar{x} + s\bar{t}, \bar{t}), \qquad \nu = 1, \dots, r, \ g \in \mathscr{I}_{X},$$

also vanishes identically.

13. THEOREM. Fix  $r \ge 1$ . Suppose  $Z \subset \left\{ (p, l) \in C^r | T_{p,l} C_p^{r-1} = T_{p,l} C_p^r \right\}$ 

is a nonempty subscheme, and  $\pi Z$  contains an irreducible component of  $\pi C^{r-1}$  as a subscheme. Then

- (i)  $Z \subset C^{\infty}$ ,
- (ii)  $T_{p,l}C_p^{r-1}$  is locally constant along the rulings l for generic  $(p, l) \in \mathbb{Z}$ .

*Proof.* We work in the coordinates (9). Let  $(\bar{x}, \bar{t}) = (p, l) \in Z$ ,  $v = \sum a_i \partial/\partial x_i + \sum b_i \partial/\partial t_i$ . Then  $v \in T_{p,l}C^{r-1}$  iff for all  $g \in \mathscr{I}_{p,X}$ ,  $v = 0, \ldots, r-1$ ,

$$0 = dg^{\nu}(v) = \sum_{i} a_{i} \frac{\partial g^{\nu}}{\partial x_{i}} + \sum_{i} b_{i} \frac{\partial g^{\nu}}{\partial t_{i}} = \sum_{i} a_{i} \frac{\partial g^{\nu+1}}{\partial t_{i}} + \sum_{i} b_{i} \frac{\partial g^{\nu}}{\partial t_{i}}$$

By the Euler relation,  $\nu g^{\nu}(\bar{x}, \bar{t}) = \sum_{i} \bar{t}_{i} \partial g^{\nu} / \partial t_{i}$ . Since  $(p, l) \in C^{r}$ ,  $T_{p,l}C^{r-1}$  contains  $w_{x} = \sum \bar{t}_{i} \partial / \partial x_{i}$  (11).

Since  $\pi Z$  contains a component of  $\pi C^{r-1}$ , and  $Z \subset C^r \subset C^{r-1}$ , it follows that at a generic point  $(p, l) \in Z$  the differential  $\pi_*: T_{p,l}C^r \to \pi_* T_{p,l}C^{r-1}$  is surjective. Its kernel is  $T_{p,l}C_p^r$ . But  $T_{p,l}C_p^r = T_{p,l}C_p^{r-1}$ , so  $T_{p,l}C^r = T_{p,l}C^{r-1}$ . In particular  $w_x \in TC^r$ , so  $0 = \sum \bar{t}_i \partial g^r / \partial x_i = \sum \bar{t}_i \partial g^{r+1} / \partial t_i = (r+1)g^{r+1}(\bar{x}, \bar{t})$ . Hence  $Z \subset C^{r+1}$ . Now let  $v_t = \sum b_i \partial/\partial t_i \in T_{p,l}C_p^{r-1}$  be any vector and set  $v_x = \sum b_i \partial/\partial x_i$ . Then  $v_t \in T_{p,l}C_p^r$ , hence for all  $g \in \mathscr{I}_{p,X}$ ,  $0 = \sum b_i \partial g^{\nu}/\partial t_i$ ,  $\nu = 1, \ldots, r$ . Thus  $v_x \in T_{p,l}C^{r-1}$ . But  $T_{p,l}C^{r-1} = T_{p,l}C^r$ , so  $v_x \in T_{p,l}C^r$ , thus  $v_t \in T_{p,l}C_p^{r+1}$ . Therefore  $T_{p,l}C_p^r = T_{p,l}C_p^{r+1}$  and (i) follows by induction.

As for (ii), if  $s \mapsto (\bar{x} + s\bar{t}, \bar{t})$  is a local parametrization of  $\lambda^{-1}(l)$  and  $\sum a_i(s)\partial/\partial t_i$  is a local holomorphic section of  $T_{,l}C_{,l}^{r-1}$  over  $\lambda^{-1}(l)$  then

$$0 \equiv \sum a_i(s) \frac{\partial g^{\nu}}{\partial t_i}(\bar{x} + s\bar{t}, \bar{t}), \text{ hence}$$

$$0 \equiv \sum_{i} a'_{i} \frac{\partial g^{\nu}}{\partial t_{i}} + \sum_{ij} a_{i} \overline{t}_{j} \frac{\partial^{2} g^{\nu}}{\partial t_{i} \partial x_{j}}, \qquad \nu = 1, \dots, r-1,$$

but  $\partial^2 g^{\nu} / \partial t_i \partial x_j = \partial^2 g^{\nu+1} / \partial t_i \partial t_j$ , so the second term vanishes by the Euler relation since  $T_{p,l} C_p^{r-1} = T_{p,l} C_p^r$ .

**REMARK.** If X is ruled then the hypotheses of (13) are satisfied for some r.

EXAMPLE. Fundamental Forms. (See [4, p. 373].) In affine coordinates, the rth osculating space  $T_p^r X \subset \mathbf{P}^n$  is the span of p and the derivatives  $\sigma'(p), \ldots, \sigma^{(r)}(p)$  of all open curves  $\sigma \subset X$  through p. Let  $p \mapsto \gamma^r(p) = T_p^r X$  be the associated rth order Gauss map. There is a natural way of representing its derivative at a generic point p by an element

$$d\gamma^{r}(p) \in H^{0}(\mathbf{P}T_{p}X, \mathcal{O}(r+1)) \otimes N_{p}(T_{p}^{r}X)$$

where  $N(T_p^r X) = T_p \mathbf{P}^n / T_p(T_p^r X)$  is the normal space.  $d\gamma^r(p)$  is the r + 1st fundamental form of X at p.

Let  $v = \sum a_{i,o} \sigma^{(i)}$  be any local section of the associated bundle  $T^r X$ (with fiber  $(T^r X)_q = T^r_q X$ ) defined near p. Then

$$v'(p) \equiv \sum a_{r,\sigma} \sigma^{(r+1)} \mod T_p(T_p^r X)$$

in coordinates. So define  $d\gamma^r$  by

$$\left[d\gamma'(\sigma'(p)^{\otimes r+1})\right] \lrcorner dg = (g \circ \sigma)^{(r+1)}(p), \text{ for all } g \in \mathscr{I}_{T'_p X, p}.$$

(This does not depend on any choices.)

The associated linear system

$$L^{r+1} = \left\{ d\gamma' \, \mathsf{J}\theta \, | \, \theta \in N_p^*(T_p^r X) \right\} \subset H^0(\mathbf{P}T_p X, \mathcal{O}(r+1))$$

is contained in the ideal of  $C_p^{r+1}$  (viewed as a subvariety of  $\mathbf{P}T_p X$ ). (Since p is a generic point we may represent X as a graph  $y_j = f_j(x)$ , j = 1, ..., k,  $x = (x_1, ..., x_m)$  in affine coordinates near p. If  $g = \sum a_j y_j$  vanishes on

 $T_p^r X$  then  $d\gamma^r \, {}_{J} dg = \sum a_j f_j^{r+1}(x(p); dx)$ . For  $r \ge 1$  this is the r + 1st order part of an element,  $\sum a_j(f_j(x) - y_j)$ , of  $\mathscr{I}_X$ ). Geometrically the reason is that, if  $(p, l) \in C_p^{r+1}$  then choose a curve  $\sigma \subset X$  through p which meets l through order r + 1.  $\sigma'(p), \ldots, \sigma^{(r+1)}(p)$  lie along  $l \subset T_p^1 X \subset T_p^r X$ , so if g vanishes on  $T_p^r X$  then  $(g \circ \sigma)^{(r+1)}(p) = 0$ .

At a generic p,  $L^2$  generates the ideal of  $C_p^2$  in  $\mathbf{P}T_pX$ , but this is not in general true of the higher  $L^r$ 's. For example, if X is a hypersurface, not a hyperplane, then  $T_p^2X = \mathbf{P}^n$  so  $L^3 = \{0\}$ . But  $\mathscr{J}_X^3 \neq \mathscr{J}_X^2$  unless X is ruled (12). A less trivial example is the following, due to Mark Green:

EXAMPLE. (Green [3].) Consider the surface  $X \subset \mathbf{P}^4$  parametrized by

$$p(s,t) = (t, s^2t^2, s^6t^3, s^{12}t^4)$$

in affine coordinates. Then

$$\frac{\partial^2 p}{\partial t^2} = \frac{s}{t^2} \frac{\partial p}{\partial s},$$

so every  $Q \in L^2$  vanishes on  $(\partial p / \partial t)^{\otimes 2}$ . In fact

$$L^2 = \operatorname{span}\{ds^2, ds \cdot dt\}.$$

By a result of Griffiths and Harris [4, p. 373], the Jacobian system of  $L^{r+1}$  is contained in  $L^r$ , r = 2, 3, ... It follows that

 $L^{r} \equiv 0 \mod \left\{ ds^{r}, ds^{r-1} \cdot dt \right\}, \qquad r = 2, 3, \dots$ 

Griffiths and Harris conjectured that any surface with such  $L^r$ 's ought to be ruled [4, p. 377]. But X is not ruled. In particular, by (12), the  $L^r$ 's cannot generate the ideal of  $C_p^r$  if  $r \ge 3$  at a generic p.

EXAMPLE. [4, p. 387]. The second fundamental form represents the derivative of the Gauss map  $\gamma = \gamma^1$ . ker  $d\gamma_p$  (projectivized) is the common singular locus in  $\mathbf{P}T_p X$  of all the quadrics in  $L^2$ .

Conversely if, at a generic  $p \in X$ , all the quadrics in  $L^2$  have a common singular locus  $Z_p$ , then the hypotheses of (13) are satisfied with r = 2: take  $Z = \bigcup Z_p$ . Then X is ruled by the planes  $\pi Z_p$ , which are the fibers of  $\gamma$  (locally).

Examples of such X are cones and developable varieties. Recently F. Zak [7, p. 540 see [2] for a proof] proved that if X is a *smooth* algebraic variety of degree  $\geq 2$  then the fibers of  $\gamma$  are finite (zero dimensional).

14. COROLLARY. Let  $X \subset \mathcal{U}$  be an irreducible variety. If X is not ruled then over a generic  $p \in X$  the dimensions dim  $T_{p,l}C_p^r$ , r = 0, 1, 2, ..., are strictly decreasing to zero for all  $(p, l) \in \pi^{-1}(p)$ . *Proof.* Let  $Z^r = \{(p, l) \in C^r | T_{p,l}C_p^r = T_{p,l}C_p^{r-1}\}$ .  $Z^r$  is an analytic variety. Since  $\pi$  is proper,  $\pi Z^r$  is an analytic subvariety of X. If X is the countable union  $X = \bigcup_{r=1}^{\infty} \pi Z^r$  then one of the  $Z^r$ 's, say  $Z^r$ , must map dominantly to X. Restricting to an open subset one may assume  $Z^r$  is surjective. Then  $X = \pi Z^r = \pi C^{r-1}$ . Apply (13).

The following answers a question in Griffiths and Harris [4, p. 450].

15. COROLLARY. Let  $X \subset \mathcal{U}$  be an irreducible hypersurface,  $p \in X$  a generic point. Then for each  $r = 1, ..., n = \dim \mathbf{P}^n$ , if  $C_p^s$  is not a smooth complete intersection of type (1, 2, ..., s) in  $\mathbf{P}(T_p\mathbf{P}^n)$  for all s = 1, ..., r (if s = n this means  $C_p^n$  is not empty) then X is ruled, and  $C_p^r$  is singular or has codimension < r in  $\mathbf{P}(T_p\mathbf{P}^n)$ .

*Proof.* Let g be a local generator for  $\mathscr{I}_X$ . Then  $C_p^r \cong \{t \mid g^1(x(p); t) = \cdots = g^r(x(p); t) = 0\}$  in  $\mathbb{P}(T_p \mathbb{P}^n)$ . Let  $1 \le r \le n$  be the least integer such that  $C_p^r$  is not a smooth complete intersection of type  $(1, \ldots, r)$ . Then  $C_p^r$  is singular or  $C_p^r = C_p^{r-1}$ . Since  $C_p^r$  has codimension at most 1 in  $C_p^{r-1}$  it follows that for some  $(p, l) \in C_p^r$ ,  $T_{p,l}C_p^r = T_{p,l}C_p^{r-1}$ . Apply (14).

If X is ruled then say the rulings are in general position if  $(\operatorname{span} C_p^{\infty}) = \mathbf{P} T_p X$  at a generic  $p \in X$ .

16. LEMMA. Let  $\mathcal{U} \subset \mathbf{P}^n$  be an open set,  $X \subset \mathcal{U}$  an irreducible, ruled variety whose rulings are in general position. Then X is piecewise linearly connected i.e. given  $p, q \in X$  there exists a finite sequence  $l_i$ , i = 0, ..., m, of line segments in X such that  $p \in l_0$ ,  $q \in l_m$  and  $l_i$  meets  $l_{i+1}$  for each i.

*Proof.* Let  $Y \subset X$  be the locus of points  $p \in X$  such that  $C_p^{\infty}$  spans  $T_pX$ . Y is a dense open subset. Let  $\mathscr{U}' \subset \mathscr{U}$  be a convex open subset such that  $\mathscr{U}' \cap X \subset Y$  is nonempty. Let  $X' \subset \mathscr{U}'$  be an irreducible component of  $\mathscr{U}' \cap X$ , and let  $C^{\infty'}$  be the  $\infty$  contact cone of X' in  $\pi^{-1}\mathscr{U}'$ . Let  $p' \in X'$ .

Since  $\pi: \pi^{-1} \mathscr{U}' \to \mathscr{U}'$  is a proper map one can define a sequence of analytic subvarieties of X by

$$C_{p'}^{\infty'}(1) = \pi C_{p'}^{\infty'}, \qquad C_{p'}^{\infty'}(k+1) = \pi \pi^{-1} C_{p'}^{\infty'}(k), \quad k = 1, 2, 3, \dots,$$

Clearly  $C_{p'}^{\infty'}(k+1)$  consists of all points in X' connected to points in  $C_{p'}^{\infty'}(k)$  by line segments in X'. Eventually the dimension of  $C_{p'}^{\infty'}(k)$  will reach a maximum. Then a generic smooth point q' of  $C_{p'}^{\infty'}(k)$  is also a smooth point of  $C_{p'}^{\infty'}(k+1)$ . But  $C_{p'}^{\infty'}(k+1)$  contains all the lines in X'

through q'. Since the rulings are in general position, dim  $C_{p'}^{\infty'}(k+1) = \dim X'$ . Since X' is irreducible,  $C_{p'}^{\infty'}(k+1) = X'$ .

Now replace X' by X,  $\mathscr{U}'$  by  $\mathscr{U}$ . Going through the same construction, construct  $C_{p'}^{\infty'}(k+1)$ . Then  $C_{p'}^{\infty'}(k+1) \subset C_{p'}^{\infty}(k+1)$ ; since X is irreducible,  $C_{p'}^{\infty}(k+1) = X$ . So every point  $p \in X$  can be connected to p' by at most k + 1 line segments, hence any two points can be connected to each other by at most 2k + 2 line segments.

17. THEOREM. Let  $X \subset \mathcal{U} \subset \mathbf{P}^n$  be an irreducible analytic hypersurface,  $p \in X$ ,  $g \in \mathscr{I}_{p,X}$  a generator. Assume

(i)  $\mathcal{J}_X^d = \mathcal{J}_X^{d+1}$  for some  $d \le n-1$ .

(ii)  $g^1(x(p); t), \ldots, g^d(x(p); t)$  are a regular sequence of polynomials (iii)  $C_p^d$  is reduced.

Then X is algebraic—there is a polynomial  $f(x_1, ..., x_n)$  of degree  $\leq d$  (in affine coordinates) vanishing on X.

Proof. Recall some consequences of (i), (ii), (iii):

18.  $C_p^d = \{t \in \mathbf{P}T_p\mathbf{P}^n | g^1(x(p); t) = \cdots = g^d(x(p); d) = 0\}, g \in \mathscr{I}_{X,p}$  a generator, is nonempty (since  $d \le n - 1$ ), smooth on a dense open subset (by (iii)), and  $C_p^d = C_p^\infty$  (by (12)).

19. Every homogeneous polynomial vanishing identically on  $C_p^d$  is in the homogeneous ideal generated by  $g^1, \ldots, g^d$ .

20. Every homogeneous relation  $\sum_{r=1}^{d} a^r g^r = 0$  is of the form  $a^r = \sum_s Q_{rs} g^s$  where  $Q_{rs}$  is an antisymmetric matrix of polynomials (19, 20 follow from (ii), (iii); use a Koszul complex).

21. If  $a^{i}(t)$ , i = 1, ..., d, are homogeneous polynomials satisfying the identity

$$0 \equiv \sum_{i=1}^{d} a^{i} \frac{\partial g^{i}}{\partial t_{\lambda}} \mod g^{1}, \dots, g^{d}, \text{ for all } \lambda = 1, \dots, n,$$

then  $a^i \equiv 0 \mod g^1, \ldots, g^d$ , for all *i*.

Proof of 21. If  $\sum_{i=1}^{d} a^{i} dg^{i} \equiv 0 \mod g^{1}, \ldots, g^{d}$  then  $0 \equiv \sum_{i=1}^{d} a^{i} dg^{i} \wedge dg^{1} \wedge \cdots \wedge dg^{d} \wedge dg^{j} \wedge \cdots \wedge dg^{d} \equiv \pm a^{j} dg^{1} \wedge \cdots \wedge dg^{d} \mod g^{1}, \ldots, g^{d}$ . By 18,  $dg^{1} \wedge \cdots \wedge dg^{d} \neq 0$  on a dense open subset of  $C_{p}^{d}$ , so  $a^{j} \equiv 0$  on  $C_{p}^{d}$ . Apply 19.

22. The points of  $C_p^d$  are in general position in the hyperplane  $g^1(t) = 0$  (by 19, since deg  $g^i = i$ ).

*Proof of theorem.* We may assume g generates  $\mathscr{I}_X$  on  $\mathscr{U}$ . Taken together (ii), (iii) are open conditions—assume they are satisfied everywhere on  $\mathscr{U}$ . We shall work in the ring  $\mathscr{O}_{\mathscr{U}}[t]$  of polynomials in t with holomorphic coefficients. All polynomials are homogeneous. Degree means degree as a polynomial in t.

Set e = d + 1. As in the proof of (12) one has local relations on  $\pi^{-1}\mathcal{U}$ :

(23) 
$$0 \equiv \sum_{i=0}^{e} a^{e-i}(x;t)g^{i}(x;t),$$

(24) 
$$0 \equiv \sum_{i=0}^{e+1} b^{e+1-i}(x;t)g^i(x;t).$$

deg  $a^i = \deg b^i = i$  for all *i*, and  $a^0, b^0 \neq 0$ . The idea is this: if f(x) = g(x)h(x) were a polynomial of degree  $\langle e \pmod{x}$  vanishing on X then, expanding as a power series, one has  $0 \equiv f^e = \sum h^{e^{-i}}g^i$ . So one can hope to recover f from (23).

One may replace  $b^i$  by  $b^i(a^0/b^0) + a^{i-1}(a^1/a^0 - b^1/b^0)$ , i = 0, ..., e + 1, (set  $a^{-1} = 0$ ). Then

$$a^0 = b^0, \quad a^1 = b^1.$$

Differentiate (23) with respect to  $x_{\lambda}$  and (24) with respect to  $t_{\lambda}$ :

$$0 = \sum_{i=0}^{e} \frac{\partial a^{e-i}}{\partial x_{\lambda}} g^{i} + \sum_{i=0}^{i} a^{e-i} \frac{\partial g^{i}}{\partial x_{\lambda}} = \sum_{i=0}^{e} \frac{\partial a^{e-i}}{\partial x_{\lambda}} g^{i} + \sum_{i=1}^{e+1} a^{e+1-i} \frac{\partial g^{i}}{\partial t_{\lambda}}$$
$$0 = \sum_{i=0}^{e} \frac{\partial b^{e+1-i}}{\partial t_{\lambda}} g^{i} + \sum_{i=1}^{e+1} b^{e+1-i} \frac{\partial g^{i}}{\partial t_{\lambda}}$$

for all  $\lambda = 1, ..., n$ , since deg  $g^0 = \text{deg } b^0 = 0$ . Subtract:

(25) 
$$0 \equiv \sum_{i=0}^{e} \left( \frac{\partial a^{e-i}}{\partial x_{\lambda}} - \frac{\partial b^{e+1-i}}{\partial t_{\lambda}} \right) g^{i} + \sum_{i=1}^{e-1} \left( a^{e+1-i} - b^{e+1-i} \right) \frac{\partial g^{i}}{\partial t_{\lambda}}.$$

Since  $g^1, \ldots, g^{e-1}$  is a regular sequence it follows (21) that  $a^{e+1-i} \equiv b^{e+1-i} \mod g^0, \ldots, g^{e-1}$  for all  $i = 1, \ldots, e+1$ . Define  $a^{e+1} = b^{e+1}$ . Write

(26) 
$$b^{e+1-i} = a^{e+1-i} + \sum_{j=0}^{e+1} P_{ij}g^j, \quad i = 0, \dots, e+1,$$

where  $P_{ij}$  has degree e + 1 - i - j when  $0 \le i, j, i + j \le e + 1$  and vanishes for *i*, *j* outside this range. Set

$$A_{ij} = \sum_{r=0}^{j+1} P_{i+1+r,j-r} - \sum_{r=0}^{i+1} P_{j+1+r,i-r}.$$

Then  $A_{ij} = -A_{ji}$ , deg  $A_{ij} = e - i - j$  for all i, j, and

$$A_{i,j-1,j} - A_{i,j-1} = P_{ij} + P_{ji}$$
 for all  $i, j = 0, \dots, e+1$ .

Define  $B_{ii}$  by

$$A_{i-1,j} + A_{i,j-1} - 2B_{ij} = P_{ij} - P_{ji}, \quad i, j = 0, \dots, e+1.$$

Then  $B_{ij} = -B_{ji}$ , deg  $B_{ij} = e + 1 - i - j$  for all i, j. Set

$$\bar{a}^{e-i} = a^{e-i} + \sum_{j=0}^{e+1} A_{ij} g^j, \qquad i = -1, \dots, e,$$
$$\bar{b}^{e+1-i} = b^{e+1-i} + \sum_{j=0}^{e+1} B_{ij} g^j, \qquad i = 0, \dots, e+1.$$

Since  $A_{ij}$ ,  $B_{ij}$  are antisymmetric the  $\bar{a}^i$ ,  $\bar{b}^i$  satisfy (23, 24). Moreover they have the right degree, and  $\bar{a}^0 = a^0 + A_{eo}g^0$  does not vanish near the locus ( $g^0 = 0$ ). Finally, one may check using (26), that

$$\bar{a}^i = \bar{b}^i, \qquad i = 0, \dots, e+1.$$

Replace the a, b's by the  $\bar{a}$ ,  $\bar{b}$ 's in (23, 24). Then (25) becomes

$$0 = \sum_{i=0}^{e} \left( \frac{\partial a^{e-i}}{\partial x_{\lambda}} - \frac{\partial a^{e+1-i}}{\partial t_{\lambda}} \right) g^{i}, \qquad \lambda = 1, \dots, n.$$

Subtract  $(\partial a^0/\partial x_\lambda - \partial a^1/\partial t_\lambda)/a^0$  times eq. (23) from this and get

$$0 \equiv \sum_{i=0}^{e-1} \left\{ \frac{\partial a^{e-1}}{\partial x_{\lambda}} - \frac{\partial a^{e+1-i}}{\partial t_{\lambda}} - \frac{a^{e-i}}{a^{0}} \left( \frac{\partial a^{0}}{\partial x_{\lambda}} - \frac{\partial a^{1}}{\partial t_{\lambda}} \right) \right\} g^{i}$$

a homogeneous relation among the  $g^i$ 's. Reducing mod  $g^0$  one can apply (20), then by adding an appropriate multiple of  $g^0$  one has

(27) 
$$\frac{\partial a^{e-i}}{\partial x_{\lambda}} = \frac{\partial a^{e+1-i}}{\partial t_{\lambda}} + \frac{a^{e-i}}{a^0} \left( \frac{\partial a^0}{\partial x_{\lambda}} - \frac{\partial a^1}{\partial t_{\lambda}} \right) + \sum_{j=0}^{e-1} Q_{ij}^{\lambda} g^j$$

 $i = 0, ..., e - 1, \lambda = 1, ..., n, \deg Q_{ij}^{\lambda} = e - i - j$  where  $Q_{ij}^{\lambda}$  is an antisymmetric matrix of polynomials.

Multiplying (23) by  $1/a^0$  we may assume  $a^0 \equiv 1$ . Then for i = e - 1 (27) becomes

(28) 
$$\frac{\partial a^1}{\partial x_{\lambda}} = \frac{\partial a^2}{\partial t_{\lambda}} - a \frac{\partial a^1}{\partial t_{\lambda}} + Q_{e^{-1,0}}^{\lambda} g^0 + Q_{e^{-1,1}}^{\lambda} g^1.$$

Consider the form

$$\Phi = \sum_{\mu} \frac{\partial a^1}{\partial t_{\mu}} dx_{\mu}, \qquad d\Phi = \sum_{\lambda \mu} \frac{\partial^2 a^1}{\partial x_{\lambda} dt_{\mu}} dx_{\lambda} \wedge dx_{\mu}.$$

Applying (28),

$$d\Phi = g^{0} \sum_{\lambda \mu} \frac{\partial Q_{e-1,0}^{\lambda}}{\partial t_{\mu}} dx_{\lambda} \wedge dx_{\mu} + \sum_{\lambda \mu} Q_{e-1,1}^{\lambda} \frac{\partial g^{1}}{\partial t_{\mu}} dx_{\lambda} \wedge dx_{\mu}.$$

Since  $\sum (\partial g^1 / \partial t_{\mu}) dx_{\mu} = dg^0$ ,  $\Phi$  is closed along  $(g^0 = 0)$ . So locally along  $(g^0 = 0)$  one can solve the equation  $d \log h(x) = \Phi$ . Multiply the  $a^i$ 's by h(x). Then

(29) 
$$\sum_{\lambda} \frac{\partial a^0}{\partial x_{\lambda}} dx_{\lambda} = \sum_{\lambda} \frac{\partial a^1}{\partial t_{\lambda}} dx_{\lambda} \mod g^0, \ dg^0.$$

Let  $\bar{x} \in X$ . Define a polynomial f(x) of degree  $\leq e - 1$  by

(30) 
$$f(x) = \sum_{i=0}^{e-1} \sum_{j=0}^{i} a^{i-j}(\bar{x}, x - \bar{x}) g^{j}(\bar{x}, x - \bar{x}).$$

It remains to show that f vanishes on X. Clearly

(31) 
$$0 = f^{0}(\bar{x}) = a^{0}(\bar{x})g^{0}(\bar{x}),$$
  

$$f^{r}(\bar{x};t) = \sum_{j=0}^{r} a^{r-j}(\bar{x};t)g^{j}(\bar{x};t), \quad r = 0, \dots, e-1, \text{ and}$$
  

$$f^{e}(x;t) \equiv 0.$$

**Define functions** 

$$f_{\lambda}^{r}(x;t) = \sum_{j=0}^{r-1} \frac{\partial a^{r-j}}{\partial t_{\lambda}}(x;t)g^{j}(x;t) + \sum_{j=1}^{r} a^{r-j}(x;t)\frac{\partial g^{j}}{\partial t_{\lambda}}(x;t),$$

$$r=1,\ldots,e, \lambda=1,\ldots,n.$$

In particular  $f_{\lambda}^{e} \equiv 0$  by (23), and  $f_{\lambda}^{r}$  is homogeneous of degree r - 1. Differentiate:

$$\frac{\partial f_{\mu}^{r}}{\partial x_{\lambda}} - \frac{\partial f_{\mu}^{r+1}}{\partial t_{\lambda}} \equiv \sum_{j=1}^{r} \left( \frac{\partial a^{r-j}}{\partial x_{\lambda}} - \frac{\partial a^{r+1-j}}{\partial t_{\lambda}} \right) \frac{\partial g^{j}}{\partial t_{\mu}} \mod g^{0}, \dots, g^{e-1}.$$

Then substituting in (27, 29) this becomes

(32) 
$$\sum_{\lambda} \left( \frac{\partial f_{\mu}^{r}}{\partial x_{\lambda}} - \frac{\partial f_{\mu}^{r+1}}{\partial t_{\lambda}} \right) dx_{\lambda} \equiv 0 \mod g^{0}, \dots, g^{e-1}, dg^{0}.$$

Let l(s) = (x + st, t) be a line in  $C^{e-1}$ . Then  $g^0, \ldots, g^{e-1}$  vanish on l. So by (32)

(33) 
$$\frac{d}{ds}\Big|_{0}f_{\mu}^{r}(x+st,t)=\sum_{\lambda}t_{\lambda}\frac{\partial f_{\mu}^{r}}{\partial x_{\lambda}}(x,t)=rf_{\mu}^{r+1}(x,t),$$

along *l*. Now it is easy to show that functions  $f_{\mu}^{r}$ , homogeneous of degree r-1 in *t*, satisfying (33) and the condition  $f_{\mu}^{e} \equiv 0$  are uniquely determined along a line by their values at a single point.

On the other hand the functions  $(\partial f'/\partial t_{\mu})(x; t)$  derived from the polynomial (30) also satisfy these relations, moreover they agree with the  $f_{\mu}^{r}$ 's at any point  $(\bar{x}, \bar{t})$  lying on a line in  $C^{e-1}$  through  $\bar{x}$  (differentiate (31) at  $\bar{x}$ ). By (22) the rulings of X are in general position, so by (12), (16)  $f_{\mu}^{r} = \partial f'/\partial t_{\mu}$  everywhere on  $C^{e-1}$ .

In particular  $\partial f^1 / \partial t_{\lambda} = f_{\lambda}^1$  on  $C^{e-1}$ . But  $df^0 = \sum (\partial f^1 / \partial t_{\lambda}) dx_{\lambda}$  and

$$\sum f_{\lambda}^{1} dx_{\lambda} = \sum \left( \frac{\partial a^{1}}{\partial t_{\lambda}} g^{0} + a^{0} \frac{\partial g^{1}}{\partial t_{\lambda}} \right) dx_{\lambda} \equiv 0 \mod g^{0}, dg^{0}.$$

Hence  $f^0$  is constant  $= f^0(\bar{x}) = 0$  on  $C^{e-1}$ . Since  $\pi C^{e-1} = X$  (18), f vanishes on X.

EXAMPLE. If  $C_p^r$  is not reduced then the conclusion of (17) may not hold.

Let  $X \subset \mathbf{P}^3$  be the cylinder

$$X = \{(x_1, x_2, x_3) | g(x_1, x_2) = 0\}$$

in affine coordinates. X may not be algebraic (if g is not).

$$g^{1}(x; dx) = g_{1} dx_{1} + g_{2} dx_{2}$$
  

$$g^{2}(x; dx) = \frac{1}{2} \left( g_{11} dx_{1}^{2} + 2g_{12} dx_{1} dx_{2} + g_{22} dx_{2}^{2} \right)$$

etc., where  $g_i = \partial g/\partial x_i$ . If  $g^1(x(p); dx) \neq 0$  and  $g^1(x(p); dx)$  does not divide  $g^2(x(p); dx)$  then  $g^1$ ,  $g^2$  are a regular sequence generating any homogeneous cubic in  $dx_1, dx_2$ . In particular  $g^3 \equiv 0 \mod g^1, g^2$ .  $C_p^2$  is supported on the point  $[dx_1, dx_2, dx_3] = [0, 0, 1]$  but it is not reduced, since  $\{dx_1, dx_2, \} \not\subset \mathcal{J}_x^2$ .

I would like to thank my teachers at UCLA, especially Mark Green, for their invaluable help and encouragement.
