# REGULARITY AT THE BOUNDARY AND TANGENTIAL REGULARITY OF SOLUTIONS OF THE CAUCHY-RIEMANN SYSTEM 

Tran Vu Khanh and Giuseppe Zampieri

#### Abstract

For a pseudoconvex domain $D \subset \mathbb{C}^{n}$, we prove the equivalence of the local hypoellipticity of the system ( $\bar{\partial}, \bar{\partial}^{*}$ ) with the system $\left(\bar{\partial}_{b}, \bar{\partial}_{b}^{*}\right)$ induced at the boundary. This develops a former result of ours in which the theory of harmonic extension by Kohn was used. This technique is inadequate for the purpose of the present paper and must be replaced by that of the holomorphic extension.

Let $D$ be a pseudoconvex domain of $\mathbb{C}^{n}$ defined by $r<0$ with $C^{\infty}$ boundary $b D$. We use the standard notation $\square=\bar{\partial} \bar{\partial} *+\bar{\partial} * \bar{\partial}$ for the complex Laplacian, $Q(u, u)=$ $\|\bar{\partial} u\|^{2}+\left\|\bar{\partial}^{*} u\right\|^{2}$ for the energy form, and some variants such as $Q_{\mathrm{Op}}(u, u)=$ $\|\mathrm{Op} \bar{\partial} u\|^{2}+\left\|\mathrm{Op} \bar{\partial}^{*} u\right\|^{2}$ for an operator Op. Here $u$ is a $(0, k)$ form belonging to $D_{\bar{\partial}^{*}}$. We similarly define the tangential versions as $\square_{b}, \bar{\partial}_{b}, \bar{\partial}_{b}^{*}$, and $Q_{\mathrm{Op}}^{b}$. We take local coordinates $(x, r)$ in $\mathbb{C}^{n}$, with $x \in \mathbb{R}^{2 n-1}$ being the tangential coordinates and $r$, the equation of $b D$, serving as the last coordinate. We define the tangential $s$-Sobolev norm by $\|u\|_{s}:=\left\|\Lambda^{s} u\right\|_{0}$, where $\Lambda^{s}$ is the standard tangential pseudodifferential operator with symbol $\Lambda_{\xi}^{s}=\left(1+|\xi|^{2}\right)^{s / 2}$. We note that

$$
\left\{\begin{array}{l}
\|\bar{\partial} u\|_{s}^{2}+\left\|\bar{\partial}^{*} u\right\|_{s}^{2}=\sum_{j \leq s} Q_{\Lambda^{s-j} \partial_{r}^{j}}(u, u),  \tag{1-1}\\
\|\bar{\partial} u\|_{s}^{2}+\left\|\bar{\partial}^{*} u\right\|_{s}^{2}=Q_{\Lambda^{s}}(u, u), \\
\left\|\bar{\partial}_{b} u_{b}\right\|_{s}^{2}+\left\|\bar{\partial}_{b}^{*} u_{b}\right\|_{s}^{2}=Q_{\Lambda^{s}}^{b}\left(u_{b}, u_{b}\right) .
\end{array}\right.
$$

We decompose $u$ into a tangential and normal component; that is,

$$
u=u^{\tau}+u^{\nu},
$$

and further decompose into microlocal components (see [Kohn 2002])

$$
u^{\tau}=u^{\tau+}+u^{\tau-}+u^{\tau 0} .
$$

We similarly decompose $u_{b}$ as $u_{b}^{+}+u_{b}^{-}+u_{b}^{0}$. We use the notation $\bar{L}_{n}$ for the normal $(0,1)$-vector field and $\bar{L}_{1}, \ldots, \bar{L}_{n-1}$ for the tangential ones. Therefore we have the

[^0]description for the totally real tangential and normal vector fields, denoted by $T$ and $\partial_{r}$ respectively:
\[

\left\{$$
\begin{array}{l}
T=i\left(L_{n}-\bar{L}_{n}\right), \\
\partial_{r}=L_{n}+\bar{L}_{n} .
\end{array}
$$\right.
\]

From this, we get back $\bar{L}_{n}=\frac{1}{2}\left(\partial_{r}+i T\right)$. We denote the symbol of a (pseudo)differential operator by $\sigma$ and the partial tangential Fourier transform of $u$ by $\tilde{u}$. We define a holomorphic extension (see [Khanh and Zampieri 2011]) $u^{\tau+(H)}$ of $\left.u^{\tau+}\right|_{b D}$ by

$$
\begin{equation*}
u^{\tau+(H)}=(2 \pi)^{-2 n+1} \int_{\mathbb{R}^{2 n-1}} e^{i x \xi} e^{r \sigma(\dot{T})} \psi^{+}(\xi) \tilde{u}(\xi, 0) d \xi \tag{1-2}
\end{equation*}
$$

where $\dot{T}:=T(x, 0)$. Note that $\sigma(T) \gtrsim\left(1+|\xi|^{2}\right)^{\frac{1}{2}}$ for $\xi$ in supp $\psi^{+}$and $(x, r)$ in a local patch; thus in the integral the exponential is dominated by $e^{\left.-|r|(1+\mid \xi)^{2}\right)^{1 / 2}}$ for $r<0$. Differently from the harmonic extension by Kohn, the present one is well defined only in positive microlocalization. We can think of $u^{\tau+(H)}$ in two different ways: as a modification of $u^{\tau+}$, or as an extension of $u_{b}^{+}$. The property which motivates the terminology of holomorphic extension is

$$
\begin{equation*}
\left\|\bar{L}_{n} u^{\tau+(H)}\right\|=\left\|r \operatorname{Tan} u^{\tau+(H)}\right\| \leq\left\|u_{b}^{\tau+}\right\|_{-\frac{1}{2}} . \tag{1-3}
\end{equation*}
$$

This follows from the relationships $\bar{L}_{n}=\frac{1}{2}\left(\partial_{r}+i T\right)$ and $T-\dot{T}=r$ Tan. We have our first relationship between a trace $v_{b}$ and the general extension $v$ ([Kohn 2002] p. 241); for any $\epsilon$ and suitable $c_{\epsilon}$,

$$
\begin{equation*}
\left\|v_{b}\right\|_{s} \lesssim c_{\epsilon}\|v\|_{s+\frac{1}{2}}+\epsilon\left\|\partial_{r} v\right\|_{s-\frac{1}{2}} . \tag{1-4}
\end{equation*}
$$

This is also seen in [Khanh and Zampieri 2011] as the small/large constant argument. As a specific property of our extension we have the reciprocal relation to (1-4):

$$
\begin{equation*}
\left\|r^{k} u^{\tau+(H)}\right\|_{s} \lesssim\left\|u_{b}^{+}\right\|_{s-k-\frac{1}{2}} . \tag{1-5}
\end{equation*}
$$

This is readily checked; see [Khanh and Zampieri 2011, (1.12)].
A combination of (1-3) and (1-4) shows that $\bar{L}_{n}$ acts on $u^{\tau+(H)}$ as an operator of order 0 . On the other hand, on the straightening of $b \Omega$ in which $r=x_{n}$, we have that $J \partial_{r}$-i.e., $T$-coincides with $\partial_{y_{n}}$, and therefore $\bar{L}_{n}$ is the Cauchy-Riemann operator $\partial_{\bar{z}_{n}}$. A reference to the related literature is in order. The extension of generalized functions to half-spaces or wedges of $\mathbb{C}^{n}$ using the decomposition of the $\delta$-function in plane waves as in (1-2) was introduced by Sato, Kashiwara, and Kawai in [Sato et al. 1973] as a general method for microlocal decomposition of the singularities. It has been used, among others, by Boutet de Monvel and Sjöstrand [1976] and by Hsiao [2010] in the study of the singularities of Szegő and Bergman kernels.

We denote by the symbol $\bar{\partial}^{\tau}$ the extension of the $\bar{\partial}_{b}$ from $b \Omega$ to $\Omega$, which stays tangential to the level surfaces $r \equiv$ const. It acts on tangential forms $u^{\tau}$ and its action is $\bar{\partial}^{\tau} u^{\tau}=\left(\bar{\partial} u^{\tau}\right)^{\tau}$. We denote its adjoint by $\bar{\partial}^{\tau *}$; thus $\bar{\partial}^{\tau *} u^{\tau}=\bar{\partial}^{*}\left(u^{\tau}\right)$. We use the notations $\square^{\tau}$ and $Q^{\tau}$ for the corresponding Laplacian and energy forms. We notice that

$$
\begin{equation*}
Q\left(u^{\tau+(H)}, u^{\tau+(H)}\right)=Q^{\tau}\left(u^{\tau+(H)}, u^{\tau+(H)}\right)+\left\|\bar{L}_{n} u^{\tau+(H)}\right\|_{0}^{2} \tag{1-6}
\end{equation*}
$$

We have to describe how (1-4) and (1-5) are affected by $\bar{\partial}$ and $\bar{\partial}^{*}$.
Proposition 1.1. We have for any extension $v$ of $v_{b}$ that

$$
\begin{equation*}
Q^{b}\left(v_{b}, v_{b}\right) \lesssim Q_{\Lambda^{\frac{1}{2}}}^{\tau}(v, v)+Q_{\partial_{r} \Lambda^{-\frac{1}{2}}}^{\tau}(v, v) \tag{1-7}
\end{equation*}
$$

and specifically for $u^{\tau+(H)}$,

$$
\begin{equation*}
Q^{\tau}\left(u^{\tau+(H)}, u^{\tau+(H)}\right) \lesssim Q_{\Lambda^{-\frac{1}{2}}}^{b}\left(u_{b}^{+}, u_{b}^{+}\right)+\left\|u_{b}^{+}\right\|_{-\frac{1}{2}}^{2} \tag{1-8}
\end{equation*}
$$

Proof. We have

$$
\left.\bar{\partial}^{\tau} v\right|_{b D}=\bar{\partial}_{b} v_{b},\left.\quad \bar{\partial} \tau * v\right|_{b D}=\bar{\partial}_{b}^{*} v_{b}
$$

Then, (1-7) follows from (1-4).
We proceed to prove (1-8). We have $\bar{\partial}^{\tau}=\bar{\partial}_{b}+r \operatorname{Tan}$, and $\bar{\partial}^{\tau *}=\bar{\partial}_{b}^{*}+r \operatorname{Tan}$, which yields

$$
\begin{align*}
\bar{\partial}^{\tau} u^{\tau+(H)} & =\left(\bar{\partial}_{b} u_{b}\right)^{\tau+(H)}+r \operatorname{Tan} u^{\tau+(H)}, \\
\bar{\partial}^{\tau *} u^{\tau+(H)} & =\left(\bar{\partial}_{b}^{*} u_{b}\right)^{\tau+(H)}+r \operatorname{Tan} u^{\tau+(H)} \tag{1-9}
\end{align*}
$$

Application of (1-5) yields

$$
\begin{aligned}
&\left\|\bar{\partial}^{\tau} u^{\tau+(H)}\right\|^{2}+\left\|\bar{\partial}^{\tau *} u^{\tau+(H)}\right\|^{2} \\
&=\left\|\left(\bar{\partial}_{b} u_{b}\right)^{\tau+(H)}\right\|^{2}+\left\|\left(\bar{\partial}_{b}^{*} u_{b}\right)^{\tau+(H)}\right\|^{2}+\left\|r \operatorname{Tan} u^{\tau+(H)}\right\|^{2} \\
& \lesssim\left\|\bar{\partial}_{b} u_{b}^{+}\right\|_{-\frac{1}{2}}^{2}+\left\|\bar{\partial}_{b}^{*} u_{b}^{+}\right\|_{-\frac{1}{2}}^{2}+\left\|u_{b}^{+}\right\|_{-\frac{1}{2}}^{2}
\end{aligned}
$$

We decompose $u^{\tau+}$ as $u^{\tau+(H)}+u^{\tau+(0)}$, which also serves as a definition of $u^{\tau+(0)}$. Let $\zeta$ and $\zeta^{\prime}$ be cut-offs with $\zeta \prec \zeta^{\prime}$ in the sense that $\left.\zeta^{\prime}\right|_{\text {supp } \zeta} \equiv 1$.
Proposition 1.2. Each of the forms $u^{\#}=u^{\nu}, u^{\tau-}, u^{\tau 0}, u^{\tau+(0)}, u_{b}^{-}$, and $u_{b}^{0}$ enjoy elliptic estimates; that is,

$$
\begin{equation*}
\left\|\zeta u^{\#}\right\|_{s} \lesssim\left\|\zeta^{\prime} \bar{\partial} u^{\#}\right\|_{s-1}+\left\|\zeta^{\prime} \bar{\partial}^{*} u^{\#}\right\|_{s-1}+\left\|u^{\#}\right\|_{0}, \quad s \geq 2 \tag{1-10}
\end{equation*}
$$

Proof. Estimate (1-10) follows by iteration from

$$
\begin{equation*}
\left\|\zeta u^{\#}\right\|_{s} \lesssim\left\|\zeta \bar{\partial} u^{\#}\right\|_{s-1}+\left\|\zeta \bar{\partial}^{*} u^{\#}\right\|_{s-1}+\left\|\zeta^{\prime} u^{\#}\right\|_{s-1} \tag{1-11}
\end{equation*}
$$

As for $u^{\nu}$ and $u^{\tau+(0)}$, this latter follows from $\left.u^{\nu}\right|_{b D} \equiv 0$ and $\left.u^{\tau+(0)}\right|_{b D} \equiv 0$. For the terms with - and 0 , this follows from the fact that $|\sigma(T)| \lesssim|\sigma(\bar{\partial})|$ in the region of 0 -microlocalization, and from $\sigma\left[\bar{\partial}, \bar{\partial}^{*}\right] \leq 0$ and $\sigma(T)<0$ in the negative microlocalization. We refer to (1) in the Main Theorem of [Folland and Kohn 1972] as a general reference, but also give an outline of the proof. We start from

$$
\begin{equation*}
\left\|\zeta u^{\#}\right\|_{1}^{2} \lesssim Q\left(\zeta u^{\#}, \zeta u^{\#}\right)+\left\|\zeta^{\prime} u^{\#}\right\|_{0}^{2} \tag{1-12}
\end{equation*}
$$

this is the basic estimate in the case of $u^{v}$ and $u^{\tau+(0)}$ (which vanish at $b D$ ), and it is Lemma 8.6 of [Kohn 2002] for $u^{\tau-}, u^{\tau 0}$ and $u_{b}^{-}, u_{b}^{0}$. Applying (1-12) to $\zeta \Lambda^{s-1} \zeta u^{\#}$ one gets the estimate of tangential norms for any $s$; that is, (1-11) with the usual norm replaced by the triplet norm. Finally, by noncharacteristicity of ( $\bar{\partial}, \bar{\partial}$ ) , one passes from tangential to full norms along the guidelines of [Zampieri 2008, Theorem 1.9.7]. The version of this argument for $\square$ can be found in [Kohn 2002, second part of p. 245].

Let $s$ and $l$ be indices.

## Theorem 1.3. Consider the estimates

(1-13) $\left\|\zeta u_{b}\right\|_{s} \lesssim\left\|\zeta^{\prime} \bar{\partial}_{b} u_{b}\right\|_{s+l}+\left\|\zeta^{\prime} \bar{\partial}_{b}^{*} u_{b}\right\|_{s+l}+\left\|u_{b}\right\|_{0} \quad$ for any $u_{b} \in C^{\infty}(b \Omega)$,
(1-14) $\|\zeta u\|_{s} \lesssim\left\|\zeta^{\prime} \bar{\partial} u\right\|_{s+l}+\left\|\zeta^{\prime} \bar{\partial}^{*} u\right\|_{s+l}+\|u\|_{0} \quad$ for any $u \in D_{\bar{\partial}^{*}} \cap C^{\infty}(\bar{\Omega})$,

$$
\begin{align*}
& \|\zeta u\|_{s} \leq \epsilon\left(\|\zeta \bar{\partial} u\|_{s}+\left\|\zeta \bar{\partial}^{*} u\right\|_{s}\right)+c_{\epsilon}\|u\|  \tag{1-15}\\
& \quad \text { for any } \epsilon, \text { for suitable } c_{\epsilon}, \text { and for any } u \in D_{\bar{\partial}^{*}} \cap C^{\infty}(\bar{\Omega}) .
\end{align*}
$$

Then (1-13) implies (1-14) and (1-15) implies (1-13) for $l=0$.
Remark 1.4. (i) The above estimates (1-13) and (1-14) for any $s, \zeta, \zeta^{\prime}$ and for suitable $l$, characterize the local hypoellipticity of the system $\left(\bar{\partial}_{b}, \bar{\partial}_{b}^{*}\right)$ and $\left(\bar{\partial}, \bar{\partial}^{*}\right)$ respectively (see [Kohn 2005]). When $l>0$, one says that the system has a loss of $l$ derivatives; when $l<0$, one says that it has a gain of $-l$ derivatives.
(ii) The point in (1-15), as opposed to (1-13) and (1-14), is that we have the same cut-off $\zeta$ in both sides, and also that there is a factor $\epsilon$ of compactness. Though (1-15) is stronger than (1-14), there are wide classes of domains $\Omega$ for which it holds, including all domains of infraexponential type, for which a superlogarithmic estimate holds (see [Baracco et al. 2014]). Indeed, let $R^{s}$ be the pseudodifferential operator defined by $\widetilde{R^{s} u}=\Lambda_{\xi}^{s \sigma(x)} \tilde{u}$ (see [Kohn 2002, p. 234]). On one hand, we have $R^{s} \sim \Lambda^{s}$ modulo operators of order $-\infty$ over $u$ such that $\left.\sigma\right|_{\text {supp } u} \equiv 1$. On the other, we have that $\left[R^{s}, \zeta^{\prime}\right]$ has order $-\infty$ if $\left.\zeta^{\prime}\right|_{\operatorname{supp} \sigma} \equiv 1$ and hence the supports of $\sigma$ and $\dot{\zeta}^{\prime}$ are disjoint. Finally, we have

$$
\left|\zeta^{\prime \prime}\left[\bar{\partial}, R^{s}\right] \zeta^{\prime}\right| \lesssim \log \Lambda R^{s} \zeta^{\prime}
$$

in the sense of operators when $\sigma \prec \zeta^{\prime} \prec \zeta^{\prime \prime}$. Using $R^{s}$ as a substitute for $\Lambda^{s}$, we can prove (1-15) whenever a superlogarithmic estimate holds (see [Kohn 2002, § 7]).
Proof. First, it is clearly not restrictive that $u$ and $u_{b}$ have compact support. Because of Proposition 1.2, it suffices to prove (1-13) for $u_{b}^{+}$and (1-14) for $u^{\tau+}$. It is also obvious that we can consider cut-off functions $\zeta$ and $\zeta^{\prime}$ only in tangential coordinates, not in $r$. We start by proving that (1-13) implies (1-14). We recall the decomposition

$$
u^{\tau+}=u^{\tau+(H)}+u^{\tau+(0)}
$$

and begin by estimating $u^{\tau+(H)}$. We then have

$$
\begin{align*}
\left\|\zeta u^{\tau+(H)}\right\| \|_{s}^{2} & \lesssim\left\|\zeta u_{b}^{+}\right\|_{s-\frac{1}{2}}^{2}  \tag{1-16}\\
& \underset{(1-5)}{\lesssim} Q_{\Lambda^{s+l-\frac{1}{2}} \zeta^{\prime}}^{b}\left(u_{b}^{+}, u_{b}^{+}\right)+\left\|u_{b}^{+}\right\|_{-\frac{1}{2}}^{2} \\
& \underset{(1-13)}{\lesssim} Q_{\Lambda^{s+l} \zeta^{\prime}}^{\tau}\left(u^{\tau+}, u^{\tau+}\right)+Q_{\partial_{r} \Lambda^{s+l-1} \zeta^{\prime}}^{\tau}\left(u^{\tau+}, u^{\tau+}\right)+\left\|u^{\tau+}\right\|_{0}^{2}
\end{align*}
$$

It remains to estimate $u^{\tau+(0)}$. Since $\left.u^{\tau+(0)}\right|_{b D} \equiv 0$, then by 1 -elliptic estimates
(1-17) $\left\|\mid \zeta u^{\tau+(0)}\right\|_{s}^{2}$

$$
\begin{aligned}
& \underset{(1-11)}{\lesssim} Q_{\Lambda^{s-1} \zeta}\left(u^{\tau+(0)}, u^{\tau+(0)}\right)+\| \| \zeta^{\prime} u^{\tau+(0)} \|_{s-1}^{2} \\
& \lesssim Q_{\Lambda^{s-1} \zeta}\left(u^{\tau+}, u^{\tau+}\right)+Q_{\Lambda^{s-1} \zeta}^{\tau}\left(u^{\tau+(H)}, u^{\tau+(H)}\right)+\| \| r \zeta u^{\tau+(H)}\left\|_{s}^{2}+\right\|\left\|\zeta^{\prime} u^{\tau+(0)}\right\|_{s-1}^{2} \\
& \lesssim Q_{\Lambda^{s-1} \zeta}\left(u^{\tau+}, u^{\tau+}\right)+\| \| \zeta u^{\tau+(H)}\left\|_{s}^{2}+\right\| \zeta^{\prime} u^{\tau+(H)}\left\|_{s-1}^{2}+\right\| \zeta^{\prime} u^{\tau+(0)} \|_{s-1}^{2},
\end{aligned}
$$

where we have used $Q=Q^{\tau}+O(r) \Lambda$ over $h^{\tau+(H)}$; that is, (1-6) in addition to $(1-3)$ in the second inequality, together with the estimate

$$
Q_{\Lambda^{s-1}}^{\tau} \lesssim \Lambda^{s}
$$

in the third. We estimate terms in the last line. First, the term $\left\|\left\|\zeta u^{\tau+(H)}\right\|_{s}^{2}\right.$ is estimated by means of (1-16). Next, the terms in $(s-1)$-norm can be brought to 0 -norm by combined inductive use of (1-16) and (1-17), and eventually their sum is controlled by $\left\|u^{\tau+}\right\|_{0}^{2}$. We put together (1-16) and (1-17) (with the above further reductions), recall the first part of (1-1) in order to estimate $Q_{\Lambda^{s+1} \zeta^{\prime}}^{\tau}+Q_{\partial_{r} \Lambda^{s+l-1} \zeta^{\prime}}^{\tau}$ in the right side of (1-16), and end up with

$$
\begin{equation*}
\left\|\zeta u^{\tau+}\right\|\left\|_{s} \lesssim\right\| \zeta^{\prime} \bar{\partial} u^{\tau+}\left\|_{s+l}+\right\| \zeta^{\prime} \bar{\partial}^{*} u^{\tau+}\left\|_{s+l}+\right\| u^{\tau+} \|_{0} . \tag{1-18}
\end{equation*}
$$

Finally, by noncharacteristicity of ( $\bar{\partial}, \bar{\partial}^{*}$ ), one passes from tangential to full norms in the left side of (1-18) along the guidelines of [Zampieri 2008, Theorem 1.9.7]. The version of this argument for $\square$ can be found in [Kohn 2002] in the second part of p . 245 . Thus we get (1-14).

We prove that (1-15) implies (1-13) for $l=0$. Thanks to $\partial_{r}=\bar{L}_{n}+$ Tan and to (1-3), we have

$$
\partial_{r} u^{\tau+(H)}=\operatorname{Tan} u^{\tau+(H)} \quad \text { and } \quad \bar{L}_{n} u^{\tau+(H)}=r \operatorname{Tan} u^{\tau+(H)} .
$$

It follows that
(1-19) $\left\|\zeta u_{b}^{+}\right\|_{s}^{2}$

$$
\begin{aligned}
& \underset{(1-4)}{\lesssim}\left\|\zeta u^{\tau+(H)}\right\|_{s+\frac{1}{2}}^{2}+\left\|\partial_{r} \zeta u^{\tau+(H)}\right\|_{s-\frac{1}{2}}^{2} \\
& \begin{array}{l}
\lesssim
\end{array}\left\|\zeta u^{\tau+(H)}\right\|_{s+\frac{1}{2}}^{2}+\left\|\bar{L}_{n} \zeta u^{\tau+(H)}\right\|_{s-\frac{1}{2}}^{2} \\
& \underset{(1-15)}{\lesssim \epsilon}\left(Q_{\Lambda^{s+\frac{1}{2} \zeta}}^{\tau}\left(u^{\tau+(H)}, u^{\tau+(H)}\right)+\left\|I \zeta \bar{L}_{n} u^{\tau+(H)}\right\|_{s+\frac{1}{2}}^{2}\right) \\
& \quad+c_{\epsilon}\left(\left\|\zeta^{\prime} u^{\tau+(H)}\right\|_{s-\frac{1}{2}}^{2}+\left\|u^{\tau+(H)}\right\|_{0}^{2}\right) \\
& \underset{(1-8)}{\lesssim} \epsilon\left(Q_{\Lambda^{s} \zeta}^{b}\left(u_{b}^{+}, u_{b}^{+}\right)+\left\|\zeta u_{b}^{+}\right\|_{s}^{2}\right)+c_{\epsilon}\left(Q_{\Lambda^{s-1} \zeta^{\prime}}^{b}\left(u_{b}^{+}, u_{b}^{+}\right)+\left\|\zeta^{\prime} u_{b}^{+}\right\|_{s-1}^{2}+\left\|u_{b}^{\tau+}\right\|_{-\frac{1}{2}}^{2}\right) \\
& \\
& \lesssim Q_{\Lambda^{s} \zeta^{\prime}}^{b}\left(u_{b}^{+}, u_{b}^{+}\right)+\epsilon\left\|\zeta u_{b}^{+}\right\|_{s}^{2}+c_{\epsilon}\left(\left\|\zeta^{\prime} u_{b}^{+}\right\|_{s-1}^{2}+\left\|u_{b}^{\tau+}\right\|_{-\frac{1}{2}}^{2}\right),
\end{aligned}
$$

where in the second-to-last line we have calculated $\left[\zeta, \#^{(H)}\right.$, which yields

$$
\left\|\zeta u^{\tau+(H)}\right\|_{s+\frac{1}{2}} \lesssim\left\|\zeta u_{b}^{+}\right\|_{s}+\left\|\zeta^{\prime} u_{b}^{+}\right\|_{s-1}
$$

(and similarly for $\left[\zeta, Q^{(H)}\right]$ ). We absorb the term with $\epsilon$ and get (1-13).
Since on a pseudoconvex domain the $H^{0}$-ranges of $\square$ and $\square_{b}$ are closed by basic estimates and by [Kohn 1986] respectively, then there are well defined $H^{0}$-inverses denoted by $N$ and $G$, and named the Neumann and Green operators.

Remark 1.5. Equations (1-13) and (1-14) imply local regularity in degree $\geq 2$ of $G$ and $N$ respectively. We first prove regularity for $N$. We start by remarking that

$$
\begin{array}{cl}
\bar{\partial}^{*} N_{q} \text { is regular over Ker } \bar{\partial} & \text { if } q \geq 2,  \tag{1-20}\\
\bar{\partial} N_{q} \text { is regular over Ker } \bar{\partial}^{*} & \text { if } q \geq 0 .
\end{array}
$$

In the first case, we set $u=\bar{\partial}^{*} N f$ for $f \in \operatorname{Ker} \bar{\partial}$. We have ( $\bar{\partial} u=f, \bar{\partial}^{*} u=0$ ), and hence by (1-14)

$$
\|\zeta u\|_{s} \lesssim\left\|\zeta^{\prime} f\right\|_{s+l}+\|u\|_{0} .
$$

To prove the second case, we simply set $u=\bar{\partial} N f$ for $f \in \operatorname{Ker} \bar{\partial}^{*}$ and reason likewise. It follows from (1-20) that the Bergman projection $B_{q}$ is regular in any degree $q \geq 0$. (Notice that even if one started from exact regularity by assuming (1-15), this is perhaps lost by taking the additional $\bar{\partial}$ in $B:=\mathrm{Id}-\bar{\partial}^{*} N \bar{\partial}$.) Finally,
we exploit formula (5.36) in [Straube 2010] in unweighted norms; that is, for $t=0$ :

$$
\begin{align*}
N_{q}=B_{q}\left(N_{q} \bar{\partial}\right)\left(\operatorname{Id}-B_{q-1}\right)\left(\bar{\partial}^{*}\right. & \left.N_{q}\right) B_{q}  \tag{1-21}\\
& +\left(\operatorname{Id}-B_{q}\right)\left(\bar{\partial}^{*} N_{q+1}\right) B_{q+1}\left(N_{q+1} \bar{\partial}\right)\left(\operatorname{Id}-B_{q}\right)
\end{align*}
$$

Now, in the right side, the $\bar{\partial} N$ 's and $\bar{\partial} * N$ 's are evaluated over Ker $\bar{\partial}^{*}$ and Ker $\bar{\partial}$ respectively; thus they are regular for $q \geq 2$. The $B$ 's are also regular and therefore such is $N$. This concludes the proof of the regularity of $N$. The proof of the regularity of $G$ is similar, apart from replacing (1-21) by its version for the Green operator $G$ stated in Section 5 of [Khanh 2010].

These supporting institutions contribute to the cost of publication of this Journal, but they are not owners or publishers and have no responsibility for its contents or policies.

See inside back cover or msp.org/pjm for submission instructions.
The subscription price for 2013 is US $\$ 400 /$ year for the electronic version, and $\$ 485 /$ year for print and electronic.
Subscriptions, requests for back issues and changes of subscribers address should be sent to Pacific Journal of Mathematics, P.O. Box 4163, Berkeley, CA 94704-0163, U.S.A. The Pacific Journal of Mathematics is indexed by Mathematical Reviews, Zentralblatt MATH, PASCAL CNRS Index, Referativnyi Zhurnal, Current Mathematical Publications and the Science Citation Index.

The Pacific Journal of Mathematics (ISSN 0030-8730) at the University of California, c/o Department of Mathematics, 798 Evans Hall \#3840, Berkeley, CA 94720-3840, is published twelve times a year. Periodical rate postage paid at Berkeley, CA 94704, and additional mailing offices. POSTMASTER: send address changes to Pacific Journal of Mathematics, P.O. Box 4163, Berkeley, CA 94704-0163.

PJM peer review and production are managed by EditFLOW ${ }^{\circledR}$ from Mathematical Sciences Publishers.

## PACIFIC JOURNAL OF MATHEMATICS

Volume 265 No. $2 \quad$ October 2013
Singularity removability at branch points for Willmore surfaces ..... 257
Yann Bernard and Tristan Rivière
On Bach flat warped product Einstein manifolds ..... 313
Qiang Chen and Chenxu He
On plane sextics with double singular points ..... 327
Alex Degtyarev
A computational approach to the Kostant-Sekiguchi correspondence ..... 349
Heiko Dietrich and Willem A. De Graaf
Landau-Toeplitz theorems for slice regular functions over quaternions ..... 381
Graziano Gentili and Giulia Sarfatti
On surgery curves for genus-one slice knots ..... 405
Patrick M. Gilmer and Charles Livingston
Characterizing abelian varieties by the reduction of the Mordell-Weil ..... 427
group
Chris Hall and Antonella Perucca
Variation of complex structures and the stability of Kähler-Ricci ..... 441
Solitons
Stuart J. Hall and Thomas Murphy
On crossed homomorphisms of the volume preserving diffeomorphism ..... 455
groups
Ryoji Kasagawa
Regularity at the boundary and tangential regularity of solutions of the ..... 491
Cauchy-Riemann system
Tran Vu Khanh and Giuseppe Zampieri
On the Steinberg character of a semisimple $p$-adic group ..... 499Ju-LeE Kim and George Lusztig

[^0]:    MSC2010: 32F10.
    Keywords: $\bar{\partial}$-Neumann problem, tangential $\bar{\partial}$ system.
