GLOBAL EXISTENCE OF SMOOTH SOLUTIONS OF A 3D LOG-LOG ENERGY-SUPERCRITICAL WAVE EQUATION

TRISTAN ROY

We prove global existence of smooth solutions of the 3D log-log energy-supercritical wave equation
\[ \partial_{tt} u - \Delta u = -u^5 \log c (\log(10 + u^2)) \]
with \(0 < c < 8/225\) and smooth initial data \((u(0) = u_0, \partial_t u(0) = u_1)\). First we control the \(L^4_t L^1_\infty x\) norm of the solution on an arbitrary size time interval by an expression depending on the energy and an a priori upper bound of its \(L^\infty_t \tilde{H}^2(\mathbb{R}^3)\) norm, with \(\tilde{H}^2(\mathbb{R}^3) := H^2(\mathbb{R}^3) \cap H^1(\mathbb{R}^3)\). The proof of this long time estimate relies upon the use of some potential decay estimates and a modification of an argument by Tao. Then we find an a posteriori upper bound of the \(L^\infty_t \tilde{H}^2(\mathbb{R}^3)\) norm of the solution by combining the long time estimate with an induction on time of the Strichartz estimates.

1. Introduction

We shall consider the defocusing log-log energy-supercritical wave equation
\[ \partial_{tt} u - \Delta u = -f(u) \quad (1-1) \]
where \(u : \mathbb{R} \times \mathbb{R}^3 \to \mathbb{R}\) is a real-valued scalar field and \(f(u) := u^5 g(u)\) with \(g(u) := \log c (\log(10 + u^2))\), \(0 < c < 8/225\). Classical solutions of (1-1) are solutions that are infinitely differentiable and compactly supported in space for each fixed time \(t\). It is not difficult to see that classical solutions of (1-1) satisfy the energy conservation law
\[ E := \frac{1}{2} \int_{\mathbb{R}^3} (\partial_t u(t, x))^2 \, dx + \frac{1}{2} \int_{\mathbb{R}^3} |\nabla u(t, x)|^2 \, dx + \int_{\mathbb{R}^3} F(u(t, x)) \, dx \quad (1-2) \]
where \(F(u) := \int_0^u f(v) \, dv\). Classical solutions of (1-1) enjoy three symmetry properties that we use throughout this paper:

- **time translation invariance**: if \(u\) is a solution of (1-1) and \(t_0\) is a fixed time then \(\tilde{u}(t, x) := u(t-t_0, x)\) is also a solution of (1-1);

- **space translation invariance**: if \(u\) is a solution of (1-1) and \(x_0\) is a fixed point lying in \(\mathbb{R}^3\) then \(\tilde{u}(t, x) := u(t, x-x_0)\) is also a solution of (1-1);

- **time reversal invariance**: if \(u\) is a solution to (1-1) then \(\tilde{u}(t, x) := u(-t, x)\) is also a solution.

**MSC2000**: 35Q55.

**Keywords**: global regularity, log-log energy supercritical wave equation.
The defocusing log-log energy-supercritical wave equation (1-1) is closely related to the power-type defocusing wave equations, namely,

$$\dot{\partial}_t u - \Delta u = -|u|^{p-1} u.$$  \tag{1-3}$$

Solutions of (1-3) have an invariant scaling

$$u(t, x) \to u^{\lambda}(t, x) := \frac{1}{\lambda^{2/(p-1)}} u\left(\frac{t}{\lambda}, \frac{x}{\lambda}\right)$$  \tag{1-4}$$

and (1-3) is $s_c$-critical, where $s_c := \frac{3}{2} - \frac{2}{p-1}$. Thus the $H^{s_c}(\mathbb{R}^3) \times \dot{H}^{s_c-1}(\mathbb{R}^3)$ norm of $(u(0), \partial_t u(0))$ is invariant under scaling, i.e.,

$$\|u^{\lambda}(0)\|_{H^{s_c}(\mathbb{R}^3)} = \|u(0)\|_{H^{s_c}(\mathbb{R}^3)},$$

$$\|\partial_t u^{\lambda}(0)\|_{\dot{H}^{s_c-1}(\mathbb{R}^3)} = \|\partial_t u(0)\|_{\dot{H}^{s_c-1}(\mathbb{R}^3)}.$$  

If $p = 5$, then $s_c = 1$ and this is why the quintic defocusing cubic wave equation

$$\dot{\partial}_t u - \Delta u = -u^5$$  \tag{1-5}$$

is called the energy-critical equation. If $1 < p < 5$ then $s_c < 1$ and (1-3) is energy-subcritical while if $p > 5$ then $s_c > 1$ and (1-3) is energy-supercritical. Notice that for every $p > 5$ there exists two positive constant $\lambda_1(p), \lambda_2(p)$ such that

$$\lambda_1(p) |u|^{5} \leq |F(u)| \leq \lambda_2(p) \max(1, |u|^p).$$  \tag{1-6}$$

This is why (1-1) is said to belong to the group of barely supercritical equations. There is another way to see that. Notice that a simple integration by part shows that

$$F(u) \sim \frac{u^6}{6} g(u),$$  \tag{1-7}$$

and consequently the nonlinear potential term of the energy $\int_{\mathbb{R}^3} F(u) \, dx \sim \int_{\mathbb{R}^3} u^6 g(u) \, dx$ just barely fails to be controlled by the linear component, in contrast to (1-5).

The energy-critical wave equation (1-5) has received a great deal of attention. Grillakis [1990; 1992] established global existence of smooth solutions (global regularity) of this equation with smooth initial data $u(0) = u_0$, $\partial_t u(0) = u_1$. His work followed that of Rauch [1981, part I] for small data and that of Struwe [1988] on the spherically symmetric case. Later Shatah and Struwe [1993] gave a simplified proof of this result. Kapitanski [1994] and, independently, Shatah and Struwe [1994] proved global existence of solutions with data $(u_0, u_1)$ in the energy class.

We are interested in proving global regularity of (1-1) with smooth initial data $(u_0, u_1)$. By standard persistence of regularity results it suffices to prove global existence of solutions

$$u \in \mathcal{C}\left([0, T], \dot{H}^2(\mathbb{R}^3)\right) \cap \mathcal{C}\left([0, T], H^1(\mathbb{R}^3)\right),$$

with data $(u_0, u_1) \in \dot{H}^2(\mathbb{R}^3) \times H^1(\mathbb{R}^3)$. Here the following space

$$\dot{H}^2(\mathbb{R}^3) := \dot{H}^2(\mathbb{R}^3) \cap \dot{H}^1(\mathbb{R}^3).$$  \tag{1-8}$$
In view of the local well-posedness theory [Lindblad and Sogge 1995], standard limit arguments and the finite speed of propagation it suffices to find an a priori upper bound of the form

$$\| (u(T), \partial_t u(T)) \|_{\dot{H}^2(\mathbb{R}^3) \times H^1(\mathbb{R}^3)} \leq C_1(\| u_0 \|_{\dot{H}^2(\mathbb{R}^3)}, \| u_1 \|_{H^1(\mathbb{R}^3)}, T)$$

(1-9)

for all times $T > 0$ and for classical solutions $u$ of (1-1) with smooth and compactly supported data $(u_0, u_1)$. Here $C_1$ is a constant depending only on $\| u_0 \|_{\dot{H}^2(\mathbb{R}^3)}$, $\| u_1 \|_{H^1(\mathbb{R}^3)}$ and the time $T$.

The global behavior of the solutions of the supercritical wave equations is poorly understood, mostly because of the lack of conservation laws in $\dot{H}^2(\mathbb{R}^3)$. Nevertheless Tao [2007] was able to prove global regularity for another barely supercritical equation, namely

$$\partial_{tt} u - \Delta u = -u^5 \log(2 + u^2),$$

(1-10)

with radial data. The main result of this paper is:

**Theorem 1.** The solution of (1-1) with smooth data $(u_0, u_1)$ exists for all time. Moreover there exists a nonnegative constant $M_0 = M_0(\| u_0 \|_{\dot{H}^2(\mathbb{R}^3)}, \| u_1 \|_{H^1(\mathbb{R}^3)})$ depending only on $\| u_0 \|_{\dot{H}^2(\mathbb{R}^3)}$ and $\| u_1 \|_{H^1(\mathbb{R}^3)}$ such that

$$\| u \|_{L^\infty_t \dot{H}^2(\mathbb{R}^3 \times \mathbb{R}^3)} + \| \partial_t u \|_{L^\infty_t H^1(\mathbb{R}^3 \times \mathbb{R}^3)} \leq M_0.$$  

(1-11)

We recall some basic properties and estimates. Let $Q$ be a function, let $J$ be an interval and let $t_0 \in J$ be a fixed time. If $u$ is a classical solution of the more general problem $\partial_{tt} u - \Delta u = Q$ then $u$ satisfies the Duhamel formula

$$u(t) = u_{l,t_0}(t) + u_{nl,t_0}(t), \quad t \in J,$$

(1-12)

with $u_{l,t_0}, u_{nl,t_0}$ denoting the linear part and the nonlinear part respectively of the solution starting from $t_0$. Recall that

$$u_{l,t_0}(t) = \cos \frac{(t - t_0)D}{D} u(t_0) + \sin \frac{(t - t_0)D}{D} \partial_t u(t_0)$$

(1-13)

and

$$u_{nl,t_0}(t) = -\int_{t_0}^t \sin \frac{(t - t')D}{D} Q(t') dt',$$

(1-14)

with $D$ the multiplier defined by $D f(\xi) := |\xi| \hat{f}(\xi)$. An explicit formula for $((\sin (t - t')D)/D) Q(t')$ and $t \neq t'$ is

$$\left[ \frac{\sin (t - t')D}{D} Q(t') \right](x) = \frac{1}{4\pi |t - t'|} \int_{|x - x'| = |t - t'|} Q(t', x') dS(x').$$

(1-15)

For a proof see [Sogge 1995]. We recall that $u_{l,t_0}$ satisfies

$$\partial_{tt} u_{l,t_0} - \Delta u_{l,t_0} = 0, \quad u_{l,t_0}(t_0) = u(t_0), \quad \partial_t u_{l,t_0}(t_0) = \partial_t u(t_0),$$

while $u_{nl,t_0}$ is the solution of

$$\partial_{tt} u_{nl,t_0} - \Delta u_{nl,t_0} = Q, \quad u_{nl,t_0}(t_0) = 0, \quad \partial_t u_{nl,t_0}(t_0) = 0.$$

We recall the Strichartz estimate [Ginibre and Velo 1995; Keel and Tao 1998; Lindblad and Sogge 1995; Sogge 1995]

$$\| u \|_{L^q_t L^r_x (J \times \mathbb{R}^3)} \lesssim \| \partial_t u(t_0) \|_{L^2(\mathbb{R}^3)} + \| \nabla u(t_0) \|_{L^2(\mathbb{R}^3)} + \| Q \|_{L^q_t L^r_x (\mathbb{R}^3 \setminus J \times \mathbb{R}^3)},$$

(1-16)
if \((q, r)\) is wave admissible, that is, \((q, r) \in (2, \infty] \times [2, \infty)\) and \(1/q + 3/r = 1/2\).

We set some notation that appears throughout the paper. We write \(C = C(a_1, \ldots, a_n)\) if \(C\) only depends on the parameters \(a_1, \ldots, a_n\). We write \(A \lesssim B\) if there exists a universal nonnegative constant \(C' > 0\) such that \(A \leq C'B\). \(A = O(B)\) means \(A \lesssim B\). More generally we write \(A \lesssim a_1, \ldots, a_n B\) if there exists a nonnegative constant \(C' = C(a_1, \ldots, a_n)\) such that \(A \leq C'B\). We say that \(C''\) is the constant determined by \(\lesssim\) in \(A \lesssim a_1, \ldots, a_n B\) if \(C''\) is the smallest constant among the \(C\)'s such that \(A \leq C'B\). We write \(A \ll a_1, \ldots, a_n B\) if there exists a universal nonnegative small constant \(c = c(a_1, \ldots, a_n)\) such that \(A \leq cB\). Similar notions are defined for \(A \gtrsim B, A \gtrsim a_1, \ldots, a_n B\) and \(A \gg B\). In particular we say that \(C''\) is the constant determined by \(\gtrsim\) in \(A \gtrsim B\) if \(C''\) is the largest constant among the \(C\)'s such that \(A \geq C'B\). If \(x\) is number then \(x^+\) and \(x^-\) are slight variations of \(x\): \(x^+ := x + \alpha \epsilon\) and \(x^- := x - \beta \epsilon\) for some \(\alpha > 0, \beta > 0\) and \(0 < \epsilon \ll 1\).

Let \(\Gamma_+\) denote the forward light cone
\[
\Gamma_+ = \{(t, x) : t > |x|\}, \tag{1-17}
\]
and if \(J = [a, b]\) is an interval, let \(\Gamma_+(J)\) denote the light cone truncated to \(J\), that is,
\[
\Gamma_+(J) := \Gamma_+ \cap (J \times \mathbb{R}^3). \tag{1-18}
\]

Let \(e(t)\) denote the local energy, that is,
\[
e(t) := \frac{1}{2} \int_{|x| \leq t} (\partial_t u(t, x))^2 \, dx + \frac{1}{2} \int_{|x| \leq t} |\nabla u(t, x)|^2 \, dx + \int_{|x| \leq t} F(u(t, x)) \, dx. \tag{1-19}
\]
If \(u\) is a solution of (1-1) then by using the finite speed of propagation and the Strichartz estimates we have
\[
\|u\|_{L^q_t L^r_x(\Gamma_+(J))} \lesssim \|\nabla u(b)\|_{L^q_t L^r_x(\mathbb{R}^3)} + \|\partial_t u(b)\|_{L^q_t L^r_x(\mathbb{R}^3)} + \|Q\|_{L^q_t L^r_x(\Gamma_+(J))} \tag{1-20}
\]
if \((q, r)\) is wave admissible. If \(J_1 := [a_1, a_2]\) and \(J_2 := [a_2, a_3]\) then we also have
\[
\|u\|_{L^q_t L^r_x(\Gamma_+(J_1 \cup J_2))} \lesssim \|\nabla u(a_3)\|_{L^q_t L^r_x(\mathbb{R}^3)} + \|\partial_t u(a_3)\|_{L^q_t L^r_x(\mathbb{R}^3)} + \|Q\|_{L^q_t L^r_x(\Gamma_+(J_1 \cup J_2))}. \tag{1-21}
\]

We recall also the well-known Sobolev embeddings. If \(h\) is a smooth function then
\[
\|h\|_{L^\infty(\mathbb{R}^3)} \lesssim \|h\|_{\dot{H}^2(\mathbb{R}^3)} \tag{1-22}
\]

and
\[
\|h\|_{L^8(\mathbb{R}^3)} \lesssim \|\nabla h\|_{L^2(\mathbb{R}^3)}. \tag{1-23}
\]
If \(u\) is the solution of (1-1) with data \((u_0, u_1) \in \dot{H}^2(\mathbb{R}^3) \times H^1(\mathbb{R}^3)\), then we get from (1-22)
\[
E \lesssim \|u_0\|_{\dot{H}^2(\mathbb{R}^3)}^2 \max(1, \|u_0\|_{\dot{H}^2(\mathbb{R}^3)}^8 v(\|u_0\|_{\dot{H}^2(\mathbb{R}^3)})). \tag{1-24}
\]

We shall use the Paley–Littlewood technology. Let \(\phi(\zeta)\) be a bump function adapted to \(\{\zeta \in \mathbb{R}^3 : |\zeta| \leq 2\}\) and equal to one on \(\{\zeta \in \mathbb{R}^3 : |\zeta| \leq 1\}\). If \((M, N) \in \mathbb{Z}^2 \times 2\mathbb{Z}\) are dyadic numbers then the Paley–Littlewood projection operators \(P_M, P_{<N}\) and \(P_{\geq N}\) are defined in the Fourier domain by
\[
\widehat{P_M f}(\zeta) := \left(\phi\left(\frac{\zeta}{M}\right) - \phi\left(\frac{\zeta}{2M}\right)\right) \hat{f}(\zeta), \quad \widehat{P_{<N} f}(\zeta) := \sum_{M \leq N} \widehat{P_M f}(\zeta), \quad \widehat{P_{\geq N} f}(\zeta) := \sum_{M \geq N} \widehat{P_M f}(\zeta).
\]
The inverse Sobolev inequality can be stated as follows:
Proposition 2 (Inverse Sobolev inequality [Tao 2006]). Let $g$ be a smooth function such that
\[ \|g\|_{\dot{H}^1(\mathbb{R}^3)} \lesssim E^{1/2}I, \quad \|P_{\geq N} g\|_{L^6_s(\mathbb{R}^3)} \gtrsim \eta, \]
for some real number $\eta > 0$ and for some dyadic number $N > 0$. Then there exists a ball $B(x, r) \subset \mathbb{R}^3$ with $r = O(1/N)$ such that we have the mass concentration estimate
\[ \int_{B(x,r)} |g(y)|^2 \, dy \gtrsim \eta^3 E^{-1/2} r^2. \]  
(1-25)

We also recall a result that shows that the mass of solutions of (1-1) can be locally in time controlled.

Proposition 3 (Local mass is locally stable [Tao 2006]). Let $J$ be a time interval, let $t, t' \in J$ and let $B(x, r)$ be a ball. Let $u$ be a solution of (1-1). Then
\[ \left( \int_{B(x,r)} |u(t', y)|^2 \, dy \right)^{1/2} = \left( \int_{B(x,r)} |u(t, y)|^2 \, dy \right)^{1/2} + O(E^{1/2}|t - t'|). \]  
(1-26)

This result, proved for (1-5) in [Tao 2006], is also true for (1-1). Indeed the proof relied upon the fact that the $L^2(\mathbb{R}^3)$ norm of the velocity of the solution of (1-5) at time $t$ is bounded by the square root of its energy, which is also true for the solution of (1-1) (by (1-2) and (1-7)).

Now we make some comments with respect to Theorem 1. If the function $g$ were a positive constant, it would be easy to prove that the solution of (1-1) with data $(u_0, u_1)$ lies in $\dot{H}^2(\mathbb{R}^3) \times H^1(\mathbb{R}^3)$, since we have a good global theory for (1-5). Therefore we can hope to prove global well-posedness for $g$ slowly increasing to infinity, by extending the technology to prove global well-posedness for (1-5). Notice also that Tao [2006] found that the solution $u$ of (1-5) satisfies
\[ \|u\|_{L^4_t L^{12}_y(\mathbb{R}^3 \times \mathbb{R}^3)} \lesssim \tilde{E}^{O(1)}, \]  
(1-27)
with $\tilde{E}$ the energy of $u$. The structure of $g$ is a double log: it is, roughly speaking, the inverse function of the towel exponential bound in (1-27).

Now we explain the main ideas of this paper.

Tao [2006] was able to bound on arbitrary long time intervals the $L^4_t L^{12}_y$ norm of solutions of the energy-critical equation (1-5) by a quantity that depends exponentially on their energy. This estimate can be viewed as a long time estimate. Unfortunately we cannot expect to prove a similar result for (1-1) since we are not in the energy-critical regime. However we shall prove the following proposition:

Proposition 4 (Long time estimate). Let $J = [t_1, t_2]$ be a time interval. Let $u$ be a classical solution of (1-1). Assume that
\[ \|u\|_{L^\infty_t \dot{H}^2(J \times \mathbb{R}^3)} \leq M \]  
(1-28)
for some $M \geq 0$. Then there exist three constants $C_{L,0} > 0$, $C_{L,1} > 0$ and $C_{L,2} > 0$ such that

- if $E \ll \frac{1}{g^{1/2}(M)}$ (small energy regime) then
  \[ \|u\|_{L^4_t L^{12}_y(J \times \mathbb{R}^3)} \lesssim C_{L,0}; \]  
  (1-29)

- if $E \gtrsim \frac{1}{g^{1/2}(M)}$ (large energy regime) then
  \[ \|u\|_{L^4_t L^{12}_y(J \times \mathbb{R}^3)} \lesssim \left( C_{L,1}(Eg(M)) \right)^{C_{L,2}(E^{193/4} + g^{225/8} + M)}. \]  
  (1-30)
This proposition shows that we can control the $L^4_t L^{12}_x (J \times \mathbb{R}^3)$ norm of solutions of (1-1) by their energy and an a priori bound of their $L^\infty_t \tilde{H}^2 (J \times \mathbb{R}^3)$ norm. We would like to control the pointwise-in-time $\tilde{H}^2 (\mathbb{R}^3) \times H^1 (\mathbb{R}^3)$ norm of $u$ on an interval $[0, T]$, with $T$ arbitrarily large. This is done by an induction on time. We assume that this norm is controlled on $[0, T]$ by a number $M_0$. Then by continuity we can find a slightly larger interval $[0, T']$ such that this norm is bounded by (say) $2M_0$ on $[0, T']$. This is our a priori bound. We subdivide $[0, T']$ into subintervals where the $L^4_t L^{12}_x$ norm of $u$ is small and we control the pointwise-in-time $\tilde{H}^2 (\mathbb{R}^3) \times H^1 (\mathbb{R}^3)$ norm of $u$ on each of these subintervals (see Lemma 6). Since $g$ varies slowly we can estimate the number of intervals of this partition by using Proposition 4 and we can prove a posteriori that $\|u(t)\|_{\tilde{H}^2 (\mathbb{R}^3)} + \|\partial_t u(t)\|_{\tilde{H}^1 (\mathbb{R}^3)}$ is bounded on $[0, T']$ by $M_0$, provided that $M_0$ is large enough; see Section 2.

The proof of Proposition 4 is a modification of the argument used in [Tao 2006] to establish a tower-exponential bound of the $L^4_t L^{12}_x (J \times \mathbb{R}^3)$ norm of $v$, the solution of (1-5). We divide $J$ into subintervals $J_i$ where the $L^4_t L^{12}_x$ norm of $u$, the solution of (1-1), is “substantial”. Then by using the Strichartz estimates and the Sobolev embedding (1-22) we notice that the $L^\infty_t L^6_x (J_i \times \mathbb{R}^3)$ norm of $u$ is also substantial, more precisely, we find a lower bound that depends on the energy $E$ and $g(M)$. Then by Proposition 2 we can localize a bubble where the mass concentrates and we prove that the size of these subintervals is also substantially large. Tao [2006] used the mass concentration to construct a solution $\tilde{u}$ of (1-5) that has a smaller energy than $v$ and that coincides with $v$ outside a cone. The idea behind that is to use an induction on the levels of energy, due to Bourgain [1999], and the small energy theory following from the Strichartz estimates in order to control the $L^4_t L^{12}_x$ norm of $v$ outside a cone. Unfortunately it seems almost impossible to apply this procedure to our problem. Indeed the energy of the constructed solution $\tilde{u}$ is smaller than the energy $E$ of $u$ by an amount that depends on $E$ but also on $g(M)$ and therefore an induction on the levels of the energy is possible if the $L^\infty_t \tilde{H}^2 (J \times \mathbb{R}^3)$ norm of $\tilde{u}$ can be controlled by $M$, which is far from being trivial. It turns out that we do not need to use the Bourgain induction method. Indeed since we know that the size of the subintervals $J_i$ is substantially large and since we have a good control of the $L^4_t L^{12}_x$ norm on these subintervals it suffices to find an upper bound of the size of their union in order to conclude. To this end we divide a cone containing the ball where the mass concentrates and the $J_i$s into truncated-in-time cones where the $L^4_t L^{12}_x$ norm of $u$ is substantial. Let $\tilde{J}_1, \tilde{J}_2, \ldots$ be the sequence of time intervals resulting from this partition. The mass concentration helps us to control the size of the first time interval $\tilde{J}_1$. By using an asymptotic stability result we can prove, roughly speaking, that if we consider two successive subintervals $\tilde{J}_j, \tilde{J}_{j+1}$ resulting from this partition of the cone then the size of $\tilde{J}_{j+1}$ can be controlled by the size of $\tilde{J}_j$; see (3-34). But a potential energy decay estimate shows that if the size of the union of the $J_i$ is too large then we can find a large subinterval $[t'_1, t'_2]$ such that the $L^4_t L^{12}_x$ norm of $u$ on the cone truncated to $[t'_1, t'_2]$ is small. Therefore $[t'_1, t'_2]$ cannot be covered by many $\tilde{J}_j$s and one of them is very large in comparison with its predecessor, which contradicts (3-34). At the end of the process we can find an upper bound of the size of the union of the subintervals $J_i$ and consequently we can control the $L^4_t L^{12}_x$ norm of $u$ on the interval $J$.

Remark 5. We will frequently use the $x+$ and $x-$ notations. Indeed the point $(2, \infty)$ is not wave admissible. Therefore we will work with the point $(2+, \infty-)$: see (5-6) and (7-9). This generates slight variations of many quantities throughout this paper. Sometimes we might deal with quantities like $z := x+/y-$. We cannot conclude directly that $z = (x/y)+$. In this case we create a variation of $y$ so
2. Proof of Theorem 1

The proof relies upon Proposition 4 and the following lemma, which we prove on page 268.

**Lemma 6** (Local boundedness). Let \( J = [t_1, t_2] \) be an interval. Assume that \( u \) is a classical solution of (1-1). Let \( Z(t) := \| (u(t), \partial_t u(t)) \|_{H^2(\mathbb{R}^3) \times H^1(\mathbb{R}^3)} \). There exists \( 0 < \epsilon \ll \text{constant} \) such that

\[
\| u \|_{L_t^4 L_x^{12}(J \times \mathbb{R}^3)} \leq \frac{\epsilon}{g^{1/4}(Z(t_1))}, \tag{2-1}
\]

then there exists \( C_l > 0 \) such that

\[
Z(t) \leq 2C_l Z(t_1) \quad \text{for } t \in J. \tag{2-2}
\]

We claim that the set

\[
\mathcal{F} := \{ T \in [0, \infty) : \sup_{t \in [0, T]} \| (u(t), \partial_t u(t)) \|_{H^2(\mathbb{R}^3) \times H^1(\mathbb{R}^3)} \leq M_0 \} \tag{2-3}
\]

is equal to \([0, \infty)\) for some constant \( M_0 := M_0(\| u_0 \|_{H^2(\mathbb{R}^3)}, \| u_1 \|_{H^1(\mathbb{R}^3)}) \) large enough. Indeed, \( 0 \in \mathcal{F} \) (this is clear); \( \mathcal{F} \) is closed, by continuity; and \( \mathcal{F} \) is open. To see this last fact, let \( T \in \mathcal{F} \). Then by continuity there exists \( \delta > 0 \) such that

\[
\sup_{t \in [0, T')} \| (u(t), \partial_t u(t)) \|_{H^2(\mathbb{R}^3) \times H^1(\mathbb{R}^3)} \leq 2M_0 \tag{2-4}
\]

for every \( T' \in [0, T + \delta) \). By (1-29) and (1-30) we have

\[
\| u \|_{L_t^4 L_x^{12}([0, T] \times \mathbb{R}^3)} \leq \max \left( C_{L,0}, (C_{L,1} E g(2M_0))^{C_{L,2}(E^{(193/4)} + 8^{(225/8)})(2M_0)) \right). \tag{2-5}
\]

Let \( N \geq 1 \) and let \( Z(0) := \max (Z(0), 1) \). Without loss of generality we can assume that \( C_l \gg 1 \) so that \( 2C_l Z(0) \gg 1 \) and \( \log^c (2C_l Z(0)) \gg 1 \). We have, by the elementary rules of the logarithm and the inequality \( \log^c (2nx) \leq \log^c ((2n)^x) \) for \( n \geq 1 \) and \( x \gg 1 \):

\[
\sum_{n=1}^{N} \frac{\epsilon^4}{g((2C_l)^n Z(0))} \geq \sum_{n=1}^{N} \frac{\epsilon^4}{\log^c (2n \log^c (2C_l Z(0)))} \geq \sum_{n=1}^{N} \frac{1}{\log^c (2n \log^c (2C_l Z(0)))} \geq \log^c (2C_l Z(0)) \sum_{n=1}^{N} \frac{1}{\log^c (2n \log (2C_l Z(0)))} \geq \log^c (2C_l Z(0)) \int_{1}^{N+1} \frac{1}{\log^c (2t)} dt \geq \log^c (2C_l Z(0)) \int_{1}^{N+1} \frac{1}{t^{1/2}} dt \geq \frac{N^{1/2}}{\log^c (2C_l Z(0))}. \tag{2-6}
\]
By Lemma 6, (2-5) and (2-6) we can construct a partition \((J_n)_{1 \leq n \leq N}\) of \([0, T']\) such that

\[
\|u\|_{L_t^4 L_x^2(\mathbb{R}^3)} = \frac{\epsilon}{g^{1/4} ((2C)^n Z_0)}, \quad 1 \leq n < N,
\]

\[
\|u\|_{L_t^4 L_x^2(\mathbb{R}^3)} \leq \frac{\epsilon}{g^{1/4} ((2C)^n Z_0)}, \quad Z(t) \leq (2C)^n Z(0),
\]

for \(t \in J_1 \cup \cdots \cup J_n\) and

\[
\frac{N^{1/2}}{\log^2 (2C_i Z(0))} \leq \max \left( C_{L,0}, (C_{L,1} E g(2M_0)) C_{L,2} (E^{193/4} + g^{225/8} + (2M_0)) \right). \tag{2-7}
\]

Since \(c < 8/225\) we have by (1-24)

\[
\log N \lesssim \log (2C_i Z(0)) + \log (C_{L,0}) + C_{L,2} E^{(193/4)} + \log \left( \frac{225c}{8} + \log \left( 10 + 4M_0^2 \right) \log \left( C_{L,1} E \log^\epsilon \log (10 + 4M_0^2) \right) \right)
\]

\[
\leq \log \left( \frac{\log (M_0/Z(0))}{\log (2C_i)} \right), \tag{2-8}
\]

if \(M_0 = M_0(\|u_0\|_{L^2(\mathbb{R}^3)}, \|u_1\|_{H^1(\mathbb{R}^3)})\) is large enough. To prove the last inequality in (2-8) it is enough, by using (1-24), to notice that \(\lim_{M_0 \to \infty} f(M_0) = 0\) with

\[
f(M_0) := \frac{\log^2 (2C_i Z(0)) + \log (C_{L,0}) + C_{L,2} E^{(193/4)} + \log \left( \frac{225c}{8} + \log \left( 10 + 4M_0^2 \right) \log \left( C_{L,1} E \log^\epsilon \log (10 + 4M_0^2) \right) \right)}{\log \left( \frac{\log (M_0/Z(0))}{\log (2C_i)} \right)}.
\]

Therefore we conclude that

\[
\sup_{t \in [0, T']} \|u(t), \partial_t u(t)\|_{H^2(\mathbb{R}^3) \times H^1(\mathbb{R}^3)} \leq (2C_i)^N Z(0) \leq M_0. \tag{2-10}
\]

**Proof of Lemma 6.** By the Strichartz estimates (1-16), the Sobolev embeddings (1-22) and (1-23) and the elementary estimate \(|u^5 \nabla (g(u))| \lesssim |u^4 \nabla u g(u)|\), we have

\[
Z(t) \lesssim Z(t_1) + \|u^5 g(u)\|_{L_t^4 L_x^2([t_1, t] \times \mathbb{R}^3)} + \|u^4 \nabla u g(u)\|_{L_t^4 L_x^2([t_1, t] \times \mathbb{R}^3)} + \|u^5 \nabla (g(u))\|_{L_t^4 L_x^2([t_1, t] \times \mathbb{R}^3)}
\]

\[
\lesssim Z(t_1) + \|u^5 g(u)\|_{L_t^4 L_x^2([t_1, t] \times \mathbb{R}^3)} + \|u^4 \nabla u g(u)\|_{L_t^4 L_x^2([t_1, t] \times \mathbb{R}^3)}
\]

\[
\lesssim Z(t_1) + \|u^4 \|_{L_t^4 L_x^2([t_1, t] \times \mathbb{R}^3)} \|u\|_{L_t^\infty L_x^\infty([t_1, t] \times \mathbb{R}^3)} g(\|u\|_{L_t^\infty L_x^\infty([t_1, t] \times \mathbb{R}^3)}) + \|u^4 \|_{L_t^4 L_x^2([t_1, t] \times \mathbb{R}^3)} \|\nabla u\|_{L_t^\infty L_x^\infty([t_1, t] \times \mathbb{R}^3)} g(\|u\|_{L_t^\infty L_x^\infty([t_1, t] \times \mathbb{R}^3)})
\]

\[
\lesssim Z(t_1) + \|u^4 \|_{L_t^4 L_x^2([t_1, t] \times \mathbb{R}^3)} Z(t) g(Z(t)). \tag{2-11}
\]

Let \(C_i\) be the constant determined by the last inequality in (2-11). From (2-1), (2-11) and a continuity argument, we have (2-2). □

**3. Proof of Proposition 4**

The proof relies upon five lemmas, which we state here and then prove in subsequent sections, after seeing how they imply the proposition.
Lemma 7 (Long time estimate if energy small). Let \( J = [t_1, t_2] \) be a time interval. Let \( u \) be a classical solution of (1-1). Assume that (1-28) holds. If
\[
E \ll \frac{1}{g^{1/2}(M)},
\]
then
\[
\|u\|_{L^4_t L^{12}_x(J \times \mathbb{R}^3)} \lesssim 1.
\] (3-2)

Lemma 8 (If \( \|u\|_{L^4_t L^{12}_x(J \times \mathbb{R}^3)} \) is nonnegligible a mass concentration bubble exists and the size of \( J \) is bounded from below). Let \( u \) be a classical solution of (1-1). Let \( J \) be a time interval. Assume that (1-28) holds. Let \( \eta \) be a positive number such that
\[
\eta \leq \frac{E^{1/12}}{g^{5/24}(M)}.
\] (3-3)

If \( \|u\|_{L^4_t L^{12}_x(J \times \mathbb{R}^3)} \geq \eta \), then
\[
\|u\|_{L^\infty_t L^6_x(J \times \mathbb{R}^3)} \gtrsim \eta^{2+} E^{-(1/2)+}.
\] (3-4)

Moreover, there exist a point \( x_0 \in \mathbb{R}^3 \), a time \( t_0 \in J \) and a positive number \( r \) such that we have the mass concentration estimate in the ball \( B(x_0, r) \)
\[
\int_{B(x_0, r)} |u(t_0, y)|^2 \, dy \gtrsim \eta^{6+} E^{-(2+)r^2},
\] (3-5)

and the following lower bound on the size of \( J \):
\[
|J| \gtrsim \eta^4 E^{-2/3} r.
\] (3-6)

Lemma 9 (Potential energy decay estimate). Let \( u \) be a classical solution of (1-1). Let \( [a, b] \) be an interval. Then we have the potential energy decay estimate
\[
\int_{|x| \leq b} F(u(b, x)) \, dx \lesssim \frac{a}{b} (e(a) + e^{1/3}(a)) + e(b) - e(a) + (e(b) - e(a))^{1/3}.
\] (3-7)

Lemma 10 (\( L^4_t L^{12}_x \) norm of \( u \) is small on a large truncation of the forward light cone). Let \( J = [t_1, t_2] \) be an interval. Let \( u \) be a classical solution of (1-1). Assume that (1-28) holds. Let \( \eta \) be a positive number such that
\[
\eta \ll \min\left( E^{1/4}, E^{5/18}, \frac{E^{1/12}}{g^{5/24}(M)} \right).
\] (3-8)

Assume also that there exists \( C_2 \gg 1 \) such that
\[
[t_1, (C_2 E^{10+} \eta^{-(36+)})^4 C_2 E^{10+} \eta^{-(36+)} t_1] \subset J.
\] (3-9)

Then there exists a subinterval \( J' = [t'_1, t'_2] \) such that \( |t'_2/t'_1| \sim E^{10+} \eta^{-(36+)} \) and
\[
\|u\|_{L^4_t L^{12}_x(t'_1, t'_2)} \lesssim \eta.
\] (3-10)

Lemma 11 (Asymptotic stability). Let \( J = [t_1, t_2] \) be a time interval. Let \( J' = [t'_1, t'_2] \subset J \) and let \( t \in J/J' \). Let \( u \) be a classical solution of (1-1). Assume that (1-28) holds. Then
\[
\|u(t, t') - u(t, t')\|_{L^\infty_t L^6_x(\mathbb{R}^3)} \lesssim \frac{E^{5/6} g^{1/6}(M)}{\text{dist}^{1/2}(t, J')},
\] (3-11)
We are ready to prove Proposition 4. We assume that we have an a priori bound $M$ of the $L^\infty_t \dot H^2_x(J \times \mathbb{R}^3)$ norm of the solution $u$. There are two steps:

- If $E \ll \frac{1}{g^{1/2}}(M)$, then we know from Lemma 7 that (1-29) holds.
- Therefore we assume that the energy is large, that is,

$$E \gtrsim \frac{1}{g^{1/2}}(M). \quad (3-12)$$

We can assume without loss of generality that

$$\|u\|_{L^4_t L^4_x(J \times \mathbb{R}^3)} \gtrsim \frac{E^{1/12}}{g^{5/24}(M)}. \quad (3-13)$$

From (3-13) we can partition $J$ into subintervals $J_1, \ldots, J_l$ such that for $i = 1, \ldots, l - 1$,

$$\|u\|_{L^4_t L^4_x(J_i \times \mathbb{R}^3)} \leq \frac{E^{1/12}}{g^{5/24}(M)} \quad \text{and} \quad \|u\|_{L^4_t L^4_x(J_{l-1} \times \mathbb{R}^3)} \leq \frac{E^{1/12}}{g^{5/24}(M)}. \quad (3-14)$$

Before moving forward we say that an interval $J_i$ is *exceptional* if

$$\|u_{l_1 l_2} \|_{L^4_t L^4_x(J_i \times \mathbb{R}^3)} + \max_{l_1, l_2} \|u_{l_1 l_2} \|_{L^4_t L^4_x(J_i \times \mathbb{R}^3)} \gtrsim \frac{1}{(C_3 E g(M))^{C_4 (E^{(193/4)} + g^{(225/8)}) + (M)}}. \quad (3-15)$$

for some $C_3 \gg 1$, $C_4 \gg 1$ to be chosen later. (The numbers $193/4$ and $225/8$ will play an important role in (3-44).) Otherwise $J_i$ is *unexceptional*. Let $\mathcal{E}$ denote the set of $J_i$ s that are exceptional and let $\mathcal{E}^c$ denote the set of nonempty sequences of consecutive unexceptional intervals $J_i$. By (1-16), (3-12) and (3-15),

$$\text{card } (\mathcal{E}) \lesssim E^2 \left[ O(E g(M)) \right]^{O(E^{(193/4)} + g^{(225/8)} + (M))} \lesssim \left[ O(E g(M)) \right]^{O(E^{(193/4)} + g^{(225/8)} + (M))}. \quad (3-16)$$

Since $\text{card } (\mathcal{E}^c) \lesssim \text{card } (\mathcal{E})$ we have

$$\|u\|^4_{L^4_t L^4_x(J \times \mathbb{R}^3)} \lesssim \left[ O(E g(M)) \right]^{O(E^{(193/4)} + g^{(225/8)} + (M))} \left( \frac{E^{1/3}}{g^{5/6}(M)} + \sup_{K \in \mathcal{E}^c} \|u\|^4_{L^4_t L^4_x(K \times \mathbb{R}^3)} \right). \quad (3-17)$$

Let $K = J_{i_0} \cup \cdots \cup J_{i_1}$ be a sequence of consecutive unexceptional intervals. If $N(K)$ is the number of $J_i$ s making $K$ then by (3-12), (3-14) and (3-17) we have

$$\|u\|_{L^4_t L^4_x(J \times \mathbb{R}^3)} \lesssim \left( \sup_{K \in \mathcal{E}^c} N(K) \right) \left[ O(E g(M)) \right]^{O(E^{(193/4)} + g^{(225/8)} + (M))}. \quad (3-18)$$

Therefore it suffices to estimate $N(K)$ for every $K = J_{i_0} \cup \cdots \cup J_{i_1}$. We will do that by first determining a lower bound for the size of the elements $J_i$ s and then by estimating the size of $K$. By (3-12), (3-14) and Lemma 8, there exists for $i \in \left[ i_0, \ldots, i_1 \right]$ a $(t_i, r_i, x_i) \in (J_i \times (0, \infty) \times \mathbb{R}^3)$ such that

$$\frac{1}{r_i^3} \int_{B(x_i, r_i)} |u(t_i, y)|^2 dy \gtrsim \frac{E^{-(3/2)+}}{g^{5/4}(M)} \quad (3-19)$$

and

$$|J_i| \gtrsim \frac{E^{-1/3} r_i}{g^{5/6}(M)}. \quad (3-20)$$
Let $k \in [i_0, \ldots, i_1]$ be such that $r_k = \min_{i \in [i_0, i_1]} r_i$; let $f(t, r, x) := \frac{1}{r^2} \int_{B(x, r)} |u(t, y)|^2 \, dy$; let $C_5$ be the constant determined by (3-19); and let $r_0 = r_0(M)$ be defined by

$$r_0M^2 = \frac{C_5E^{-(3/2)+}}{4g^{(5/4)+}(M)}.$$ 

Since $f(t, r, x) \leq rM^2$ we have

$$f(t, r_0, x) \leq \frac{C_5E^{-(3/2)+}}{4g^{(5/4)+}(M)}.$$ 

The set $A := \{(t, r, x) : t \in K, r_0 \leq r \leq r_k, x \in \mathbb{R}^3\}$ is connected. Therefore its image is connected by $f$ and there exists $(\tilde{t}, \tilde{r}, \tilde{x}) \in K \times [r_0, r_k] \times \mathbb{R}^3$ such that $f(\tilde{t}, \tilde{r}, \tilde{x}) = (C_5E^{-(3/2)+})/(2g^{(5/4)+}(M))$. In other words we have the following mass concentration

$$\frac{1}{\tilde{r}^2} \int_{B(\tilde{x}, \tilde{r})} u^2(\tilde{t}, x) \, dx = \frac{C_5E^{-(3/2)+}}{2g^{(5/4)+}(M)}. \quad (3-21)$$

Moreover we have the useful lower bound for the size of $J_i$,$^1$ $i_0 \leq i \leq i_1$:

$$|J_i| \gtrsim \tilde{r}E^{-1/3}g^{5/6}(M). \quad (3-22)$$

At this point we need to use the following lemma, which gives information about the size of $K$.

**Lemma 12.** Let $K$ be a sequence of unexceptional intervals. Assume there exist $\tilde{t} \in K$, $\tilde{x} \in \mathbb{R}^3$ and $\tilde{r} \in (0, \infty)$ such that

$$\frac{1}{\tilde{r}^2} \int_{B(\tilde{x}, \tilde{r})} u^2(\tilde{t}, y) \, dy \gtrsim E^{-(3/2)+}g^{(5/4)+}(M). \quad (3-23)$$

Then there exist two constants $C_6 \gg 1, C_7 \gg 1$ such that

$$|K| \leq (C_6Eg(M))^{C_7E^{(19)(4)+}g^{(225)(8)+}(M)}\tilde{r}. \quad (3-24)$$

If we combine the lemma with (3-22) we can estimate $N(K)$. More precisely, by Lemma 12, (3-22) and (3-12) we have

$$N(K) \lesssim \frac{(C_6Eg(M))^{C_7E^{(19)(4)+}g^{(225)(8)+}(M)}\tilde{r}}{\tilde{r}E^{-(3/2)+}g^{5/6}(M)} \lesssim (O(Eg(M)))^{O(E^{(19)(4)+}g^{(225)(8)+}(M))}. \quad (3-25)$$

Plugging this upper bound for $N(K)$ into (3-18) we get (1-30), completing the proof of the proposition (modulo the lemmas).

**Proof of Lemma 12.** By using the space translation invariance of (1-1) we can reduce to the case where $\tilde{x}$ vanishes.$^2$ By using the time reversal invariance and the time translation invariance$^3$ it suffices to estimate $|K \cap [\tilde{t}, \infty]|$. By using the time translation invariance again$^4$ we can assume that $\tilde{t} = \tilde{r}$ and

---

$^1$Notice that we have the lower bound $\tilde{r} \gtrsim C_5E^{-(3/2)+}/(4M^2g^{(5/4)+}(M))$. One might think that the presence of $\tilde{r}$ in (3-22) is annoying since this lower bound is crude. However we will see that $\tilde{r}$ disappears at the end of the process: see (3-25). Therefore a sharp lower bound is not required.

$^2$We consider the function $u_1(t, x) = u(t, x - \tilde{x})$ and we abuse notation in the sequel by writing $u_1$ for $u$.

$^3$We consider the function $u_2(t, x) := u(2\tilde{t} - t, x)$ and we abuse notation in the sequel by writing $u_2$ for $u$.

$^4$We consider the function $u_3(t, x) := u(t + (\tilde{t} - \tilde{r}), x)$ and we abuse notation in the sequel by writing $u_3$ for $u$. 

---
therefore $\tilde{r} \in K$. Let $K_+ := K \cap [\tilde{r}, \infty)$. We are interested in estimating $|K_+|$. We would like to use Lemma 10. Therefore, we consider the set $\Gamma_+ (K_+)$. We have

$$\frac{1}{\tilde{r}^2} \int_{B(0, \tilde{r})} |u(\tilde{r}, y)|^2 \, dy \gtrsim \frac{E^{-((3/2)+)}}{g^{(5/4)+}(M)}.$$  

(3-26)

Therefore by Proposition 3 and (3-26) we have

$$\int_{B(0, \tilde{r})} |u(t, y)|^2 \, dy \gtrsim \frac{E^{-((3/2)+)} \tilde{r}^2}{g^{(5/4)+}(M)}.$$  

(3-27)

if $(t-\tilde{r})E^{1/2} \leq (c_0 E^{-((3/4)+)} \tilde{r} / g^{(5/8)+}(M))$ for some $c_0 \ll 1$. Therefore by Hölder there exists $0 < c_1 \ll 1$ small enough such that

$$\|u\|_{L^4_t L^2_y (\Gamma_+ (K_+))} \geq c_1 \frac{E^{-((17/16)+)}}{g^{(5/8)+}(M)}.$$  

(3-28)

Suppose first that $\|u\|_{L^4_t L^2_y (\Gamma_+ (K_+))} \leq c_1 \frac{E^{-((17/16)+)}}{g^{(5/8)+}(M)}$. In this case we get from (3-28)

$$K_+ \subset \left[ \tilde{r}, \tilde{r} + \frac{c_0 E^{-((5/4)+)} \tilde{r}}{g^{(5/8)+}(M)} \right],$$  

(3-29)

and, using also (3-12), we get (3-24).

Now suppose instead that $\|u\|_{L^4_t L^2_y (\Gamma_+ (K_+))} \geq c_1 \frac{E^{-((17/16)+)}}{g^{(5/8)+}(M)}$. Define

$$\tilde{\eta} := \frac{c_1 E^{-((17/16)+)}}{4 \ g^{(25/32)+}(M)},$$  

(3-30)

and divide $\Gamma_+ (K_+)$ into consecutive cone truncations $\Gamma_+ (\tilde{J}_1), \ldots, \Gamma_+ (\tilde{J}_k)$ such that, for $j = 1, \ldots, k-1$,

$$\|u\|_{L^4_t L^2_y (\Gamma_+ (\tilde{J}_j))} = \tilde{\eta}$$  

(3-31)

and

$$\|u\|_{L^4_t L^2_y (\Gamma_+ (\tilde{J}_k))} \leq \tilde{\eta}.$$  

(3-32)

We get from (3-28)

$$\tilde{J}_1 \subset \left[ \tilde{r}, \tilde{r} + \frac{c_0 E^{-((5/4)+)} \tilde{r}}{g^{(5/8)+}(M)} \right].$$  

(3-33)

**Result 13.** If $j \in [1, \ldots, k-1]$ we either have

$$|\tilde{J}_{j+1}| \lesssim |\tilde{J}_j| \tilde{\eta}^{-4} E^{8/3} g^{1/3}(M)$$  

(3-34)

or

$$|\tilde{J}_j| \geq (C_6 E g(M))^{C_7} E^{(193/4)+} g^{(225/8)+}(M) \tilde{r}.$$  

(3-35)

for some constants $C_6 \gg 1$, $C_7 \gg 1$. 
Proof. We get from (1-21), (3-12) and (3-30)
\[ \|u - u_{t,j+1}\| L^2_t L^1_x(\Gamma_+(J_j)) \lesssim \|u^5 g(u)\| L^1_t L^2_x(\Gamma_+(J_j)) \]
\[ \lesssim \|u^4\| L^1_t L^2_x(\Gamma_+(J_j)) \|ug^{1/6}(u)\| L^\infty_t L^1_x(\Gamma_+(J_j)) g^{5/6}(M) \]
\[ \lesssim \bar{\eta}^4 E^{1/6} g^{5/6}(M) \]
\[ \ll \bar{\eta}, \quad (3-36) \]
with \( J_j = [t_{j-1}, t_j] \). Therefore by (3-31) we have \( \|u_{t,j+1}\| L^2_t L^1_x(\Gamma_+(J_j)) \sim \bar{\eta} \). This implies that
\[ \|u_{t,j+1} - u_{t,\tilde{t}}\| L^2_t L^1_x(\Gamma_+(J_j)) \gtrsim \bar{\eta} \quad (3-37) \]
or
\[ \|u_{t,\tilde{t}}\| L^2_t L^1_x(\Gamma_+(J_j)) \gtrsim \bar{\eta}. \quad (3-38) \]

Case 1. \( \|u_{t,j+1} - u_{t,\tilde{t}}\| L^2_t L^1_x(\Gamma_+(J_j)) \gtrsim \bar{\eta} \). By Lemma 11 and Hölder we have
\[ \|u_{t,j+1} - u_{t,\tilde{t}}\| L^2_t L^1_x(\Gamma_+(J_j)) \lesssim \left| \tilde{J}_j \right|^{1/4} \|u_{t,j+1} - u_{t,\tilde{t}}\| L^\infty_t L^1_x(\Gamma_+(J_j)) \]
\[ \lesssim \left| \tilde{J}_j \right|^{1/4} \|u_{t,j+1} - u_{t,\tilde{t}}\| L^\infty_t L^\infty_x(\Gamma_+(J_j)) \|u_{t,j+1} - u_{t,\tilde{t}}\| L^2_t L^1_x(\Gamma_+(J_j)) \]
\[ \lesssim \frac{\left| \tilde{J}_j \right|^{1/4} E^{2/3} g^{1/12}(M)}{\left| \tilde{J}_{j+1} \right|^{1/4}}. \quad (3-39) \]
We get (3-34) from (3-37) and (3-39).

Case 2. \( \|u_{t,\tilde{t}}\| L^2_t L^1_x(\Gamma_+(J_j)) \gtrsim \bar{\eta} \). In this case \( \|u_{t,\tilde{t}}\| L^2_t L^1_x(\Gamma_+(J_j)) \gtrsim \bar{\eta} \). Recall that \( K_+ \) is a subinterval of \( K = J_{i_0} \cup \cdots \cup J_{i_1} \), sequence of unexceptional intervals \( J_i, i_0 \leq i \leq i_1 \). Consequently there are at least \( \bar{\eta}(C_3 E\bar{g}(M))^{C_4 E^{(193/4)+} g^{(225/8)+}(M)} \) intervals \( J_j \) that cover \( \tilde{J}_j \). Therefore we get (3-35) from (3-22) and (3-12). \( \square \)

Using Result 13 and Lemma 10 we can get an upper bound on the size \( |K_+| \):

Result 14. We have
\[ |K_+| \leq (C_6 E\bar{g}(M))^{C_7 (E^{(193/4)+} g^{(225/8)+}(M))} \bar{r}. \quad (3-40) \]

Proof. Let \( B := (C_6 E\bar{g}(M))^{C_7 (E^{(193/4)+} g^{(225/8)+}(M))} \). Assume that (3-40) fails. Let \( \tilde{J}_{j_1} \) be the first interval for which \( |\tilde{J}_1 \cup \cdots \cup \tilde{J}_{j_1}| \) exceeds \( B\bar{r} \). Then \( j_1 \neq 1, \left| \tilde{J}_{j_1} \right| \lesssim \left| \tilde{J}_{j_1-1} \right| \bar{\eta}^{-4} E^{8/3} g^{1/3}(M) \) and we have
\[ \frac{c_1 E^{-5/4}}{g^{(5/8)}(M)} + T_2 - T_1 + (T_2 - T_1) \eta^{-4} E^{8/3} g^{1/3}(M) \gtrsim \eta_1 + \cdots + \left| \tilde{J}_{j_1} \right| \geq B\bar{r}, \quad (3-41) \]
if \( [T_1, T_2] := \tilde{J}_2 \cup \cdots \cup \tilde{J}_{j_1-1} \). Therefore by (3-12) and (3-41) we have
\[ T_2 - T_1 \gtrsim \frac{\eta_1}{g^{1/3}(M)} \cdot \frac{E^{-(8/3)}}{B\bar{r}} \quad (3-42) \]
Moreover \( T_1 \leq \bar{r} + (c_1 E^{-(5/4)+})/(g^{(5/8)+}(M)) \). Therefore by (3-12) we have
\[ T_1 = O(\bar{r}). \quad (3-43) \]
By (3-42) and (3-43) we have

$$\frac{T_2}{T_1} \geq \left( C_2 E^{10^+} \left( \frac{\tilde{\eta}}{4} \right)^{-36^+} \right)^4 C_2 E^{10^+ (\tilde{\eta}/4)^{-36^+}}$$

with $C_2$ defined in Lemma 10, provided that $C_6, C_7 \gg \max (C_1, C_2)$. Therefore we can apply Lemma 10 and find a subinterval $[t'_1, t'_2] \subset J_2 \cup \cdots \cup J_{j-1}$ with $|t'_2/t'_1| \sim E^{10^+ \tilde{\eta}^{-36^+}}$ and $\|u\|_{L^\infty_t L^2_x([t'_1, t'_2])} \leq \tilde{\eta}/4$. This means that $[t'_1, t'_2] \subset [T_1, T_2]$ is covered by at most two consecutive intervals. It is convenient to introduce $[t'_1, t'_2]_g$, the geometric mean of $t'_1$ and $t'_2$. We have $[t'_1, t'_2]_g \sim \tilde{\eta}^{-18} E^5 t'_1$. There are two cases.

**Case 1.** $[t'_1, t'_2]$ is covered by one interval $\tilde{J}_j = [a_j, b_j]$, $2 \leq j \leq j_1 - 1$. Then $|\tilde{J}_j| \gtrsim \tilde{\eta}^{-36^+} E^{10^+ t'_1}$ and $|\tilde{J}_{j-1}| \leq t'_1$. Therefore $|\tilde{J}_j| \gtrsim \tilde{\eta}^{-36^+} E^{10^+} |\tilde{J}_{j-1}|$. Contradiction with (3-12) and (3-34).

**Case 2.** $[t'_1, t'_2]$ is covered by two intervals $\tilde{J}_j = [a_j, b_j]$ and $\tilde{J}_{j+1} = [a_{j+1}, b_{j+1}]$ for some $2 \leq j \leq j_1 - 2$. Then there are two subcases.

**Case 2a.** $b_j \leq [t'_1, t'_2]_g$. In this case $|\tilde{J}_{j+1}| \gtrsim \tilde{\eta}^{-36^+} E^{10^+ t'_1}$ and $|\tilde{J}_j| \leq \tilde{\eta}^{-18^+} E^{5^+} t'_1$. Therefore by (3-12) we have $|\tilde{J}_{j+1}| \gtrsim \tilde{\eta}^{-18^+} E^{5^+} |\tilde{J}_j|$. Contradiction with (3-12) and (3-34).

**Case 2b.** $b_j \geq [t'_1, t'_2]_g$. In this case by (3-12) $|\tilde{J}_j| \gtrsim \tilde{\eta}^{-18^+} E^{5^+} t'_1$ and $|\tilde{J}_{j-1}| \leq t'_1$. Therefore $|\tilde{J}_j| \gtrsim \tilde{\eta}^{-18^+} E^{5^+} |\tilde{J}_{j-1}|$. Contradiction with (3-12) and (3-34).

This exhausts all cases. Thus we have proved Result 14 and so also Lemma 12.

**Remark 15.** It seems likely that we can find a better upper bound for $|K_+|$ than (3-40) by exploiting Lemma 11 in a better way. For instance we can consider $k$ successive time intervals $\tilde{J}_{j+1}, \ldots, \tilde{J}_{j+k}$, $k > 1$ and prove an estimate like

$$|\tilde{J}_{j+1}| + \cdots |\tilde{J}_{j+k}| \lesssim |\tilde{J}_j| \tilde{\eta}^{-4} E^{8/3} g^{1/3}(M).$$

(3-45)

This estimate is stronger than (3-34). We can probably find a smaller $B$ such that (3-44) holds with $\tilde{\eta}$ substituted for something like $k \tilde{\eta}$ and, by modifying the argument above, find a contradiction with (3-45). At the end of the process we can probably prove global existence of smooth solutions to (1-1) for $0 < c < c_0$, with $c_0 > 8/225$ to be determined. We will not pursue these matters.

### 4. Proof of Lemma 7

Applying the Strichartz estimates and the Hölder inequality,

$$\|u\|_{L_t^4 L_x^4(J \times \mathbb{R}^3)} \lesssim E^{1/2} + \|u^4\|_{L_t^2 L_x^2(J \times \mathbb{R}^3)} \|u g^{1/6}(u)\|_{L_t^\infty L_x^2(J \times \mathbb{R}^3)} \|g^{5/6}(u)\|_{L_t^\infty L_x^\infty(J \times \mathbb{R}^3)}$$

$$\lesssim E^{1/2} + E^{1/6} g^{5/6}(M) \|u\|_{L_t^4 L_x^4(J \times \mathbb{R}^3)}^4.$$  

(4-1)

Hence (3-2) by (3-1) and a continuity argument.
5. Proof of Lemma 8

Let $J' = [t_1', t_2'] \subset J$ be such that $\|u\|_{L^1_t L^{12}_x(J' \times \mathbb{R}^3)} = \eta$. Then by (1-22) and (3-3)

$$
\|f(u)\|_{L^1_t L^{12}_x(J' \times \mathbb{R}^3)} \lesssim \|u g^{1/6}(u)\|_{L^\infty_t L^{6}_x(J' \times \mathbb{R}^3)} \|u\|_{L^4_t L^{24}_x(J' \times \mathbb{R}^3)} \|g^{5/6}(u)\|_{L^\infty_t L^{12}_x(J' \times \mathbb{R}^3)} \\
\lesssim E^{1/6} \eta^{4} g^{5/6}(M) \lesssim E^{1/2}.
$$

(5-1)

It is slightly unfortunate that $(2, \infty)$ is not wave admissible. Therefore we consider the admissible pair $(2 + \epsilon, \ 6(2+\epsilon)/\epsilon)$ with $\epsilon \ll 1$. By the Strichartz estimates and (5-1), we have

$$
\|u\|_{L^4_t L^{12}_x(J' \times \mathbb{R}^3)} \lesssim \|\nabla u(t_1')\|_{L^2(\mathbb{R}^3)} + \|u(t_1')\|_{L^2(\mathbb{R}^3)} + \|f(u)\|_{L^1_t L^{12}_x(J' \times \mathbb{R}^3)} \lesssim E^{1/2}.
$$

(5-2)

Let $N$ be a frequency to be chosen later. By the Bernstein inequality and (1-7) we have

$$
\|P_{<N}u\|_{L^4_t L^{12}_x(J' \times \mathbb{R}^3)} \lesssim N^{1/4} |J'|^{1/4} \|u\|_{L^\infty_t L^{6}_x(J' \times \mathbb{R}^3)} \lesssim N^{1/4} |J'|^{1/4} E^{1/6}.
$$

(5-3)

Therefore

$$
\|P_{<N}u\|_{L^4_t L^{12}_x(J' \times \mathbb{R}^3)} \lesssim |J'|^{1/4} N^{1/4} E^{1/6}.
$$

(5-4)

Let $c_2 \ll 1$. Then if $N = c_2^4 (\eta^4 / (|J'| E^{2/3}))$ we have

$$
\|P_{\geq N}u\|_{L^4_t L^{12}_x(J' \times \mathbb{R}^3)} \gtrsim \eta \quad \text{and} \quad \|u\|_{L^4_t L^{12}_x(J' \times \mathbb{R}^3)} \sim \|P_{\geq N}u\|_{L^4_t L^{12}_x(J' \times \mathbb{R}^3)}.
$$

(5-5)

By (5-2) and (5-5) we have

$$
\eta \sim \|P_{\geq N}u\|_{L^4_t L^{12}_x(J' \times \mathbb{R}^3)}
\lesssim \|P_{\geq N}u\|^2_{L^4_t L^{12}_x(J' \times \mathbb{R}^3)} \|P_{\geq N}u\|^{1-(2+\epsilon)/4}_{L^\infty_t L^{6}_x(J' \times \mathbb{R}^3)}
\lesssim E^{(2+\epsilon)/8} \|P_{\geq N}u\|^{1-(2+\epsilon)/4}_{L^\infty_t L^{6}_x(J' \times \mathbb{R}^3)}.
$$

(5-6)

Therefore we conclude that $\|P_{\geq N}u\|_{L^\infty_t L^{6}_x(J' \times \mathbb{R}^3)} \gtrsim \eta^{2+} E^{-((1/2)+)}$. Applying Proposition 2 we get (3-5).

6. Proof of Lemma 9

Bahouri and Gerard [1999, page 171] used arguments from Grillakis [1990; 1992] and Shatah–Struwe [1993] to derive an a priori estimate of the solution $u$ to the 3D quintic defocusing wave equation, that is, $\partial_t u - \Delta u + u^5 = 0$. More precisely they were able to prove

$$
\int_{|x| \leq b} |u(b, x)|^6 \, dx \lesssim \frac{a}{b} (\tilde{e}(a) + \tilde{e}^{1/3}(a)) + \tilde{e}(b) - \tilde{e}(a) + (\tilde{e}(b) - \tilde{e}(a))^{1/3},
$$

(6-1)

with

$$
\tilde{e}(t) := \frac{1}{2} \int_{|x| \leq t} (\partial_t u)^2 \, dx + \frac{1}{2} \int_{|x| \leq t} |\nabla u|^2 \, dx + \frac{1}{6} \int_{|x| \leq t} u^6 \, dx.
$$

(6-2)

Since we apply their ideas to the potential $f$ we just sketch the proof. Given the cone $\Gamma_+([a, b])$ we denote by $\partial \Gamma_+([a, b])$ the mantle of the cone $\Gamma_+([a, b])$, that is,

$$
\partial \Gamma_+([a, b]) := \{(t', x) \in [a, b] \times \mathbb{R}^3, \ t = |x|\}.
$$

(6-3)
The local energy identity

\[ e(b) - e(a) = \frac{1}{2\sqrt{2}} \int_{\partial \Gamma_+(\{a, b\})} \left| \frac{x \partial_t u}{t} + \nabla u \right|^2 + \frac{1}{\sqrt{2}} \int_{\partial \Gamma_+(\{a, b\})} F(u) \]  

(6-4)

results from the integration of the identity \( \partial_t u (\partial_t u - \Delta u + f(u)) = 0 \) on the cone \( \Gamma_+(\{a, b\}) \). We have [Shatah and Struwe 1998]

\[ \partial_t \left( \frac{t}{2} (\partial_t u)^2 + \frac{t}{2} |\nabla u|^2 + (x \cdot \nabla u) \partial_t u + t F(u) + u \partial_t u \right) \]

\[ - \text{div} \left( t \nabla u \partial_t u + (x \cdot \nabla u) \partial_t u + t F(u) + u \partial_t u + t \frac{\nabla u \cdot x}{|x|} \partial_t u + \frac{|\nabla u|^2}{|x|} \right) \]

\[ \text{div} \left( -\frac{|\nabla u|^2}{2} \frac{|\partial_t u|^2}{|x|} + \frac{2 \partial_t u}{|x|} \frac{\partial_t u}{|x|} \right) \]

\[ \partial_t \left( \frac{t}{2} (\partial_t u)^2 + \frac{t}{2} |\nabla u|^2 + (x \cdot \nabla u) \partial_t u + t F(u) + u \partial_t u + t \frac{\nabla u \cdot x}{|x|} \partial_t u + \frac{|\nabla u|^2}{|x|} \right) \]

(6-5)

Integrating this identity on \( \Gamma_+(\{a, b\}) \), we have

\[ X(b) - X(a) + Y(a, b) = \int_{\Gamma_+(\{a, b\})} 4F(u) - uf(u), \]

(6-6)

with

\[ X(t) := \int_{|x| \leq t} \left( \frac{t}{2} (\partial_t u)^2 + \frac{t}{2} |\nabla u|^2 + (x \cdot \nabla u) \partial_t u + t F(u) + u \partial_t u \right) \]

and

\[ Y(a, b) := -\frac{1}{\sqrt{2}} \int_{\partial \Gamma_+(\{a, b\})} \left( \frac{t}{2} (\partial_t u)^2 + \frac{t}{2} |\nabla u|^2 + (x \cdot \nabla u) \partial_t u + t F(u) + u \partial_t u + t \frac{\nabla u \cdot x}{|x|} \partial_t u + \frac{|\nabla u|^2}{|x|} \right) \]

\[ -\frac{|\nabla u|^2}{2} \frac{|\partial_t u|^2}{|x|} + \frac{2 \partial_t u}{|x|} \frac{\partial_t u}{|x|} \]

(6-7)

In fact we have [Shatah and Struwe 1993]

\[ X(t) = \int_{|x| \leq t} \left[ \frac{1}{2} (\partial_t u)^2 + \frac{1}{2} \left( \nabla u + \frac{ux}{|x|^2} \right)^2 \right] + \partial_t u (x \cdot \nabla u + u) + t F(u) - \int_{|x| = t} \frac{u^2}{2}. \]

(6-9)

Since \( t = |x| \) on \( \partial \Gamma_+(\{a, b\}) \) we have

\[ Y(a, b) = -\frac{1}{\sqrt{2}} \int_{\partial \Gamma_+(\{a, b\})} \left[ |x| (\partial_t u)^2 + 2 (x \cdot \nabla u) \partial_t u + u \partial_t u + \frac{(x \cdot \nabla u)^2}{|x|} \right] + \frac{\nabla u \cdot x}{|x|} + u \frac{\nabla u \cdot x}{|x|}, \]

(6-10)

and after some computations [Shatah and Struwe 1993], we get

\[ Y(a, b) = -\frac{1}{\sqrt{2}} \int_{\partial \Gamma_+(\{a, b\})} \left[ \frac{1}{2} (t \partial_t u + (\nabla u \cdot x) + u)^2 + \int_{|x| = b} \frac{u^2}{2} - \int_{|x| = a} \frac{u^2}{2} \right]. \]

(6-11)

Therefore, if

\[ H(t) := \int_{|x| \leq t} \left[ \frac{1}{2} (\partial_t u)^2 + \frac{1}{2} \left( \nabla u + \frac{ux}{|x|^2} \right)^2 \right] + \partial_t u (x \cdot \nabla u + u) + t F(u), \]

(6-12)

then

\[ H(b) - H(a) = \frac{1}{\sqrt{2}} \int_{\partial \Gamma_+(\{a, b\})} \frac{1}{t} (t \partial_t u + \nabla u \cdot x + u)^2 + \int_{\Gamma_+(\{a, b\})} 4F(u) - uf(u). \]

(6-13)
We estimate $H(t)$, following [Bahouri and Gérard 1999]. We have

$$|\partial_t u(x, \nabla u + u)| \leq \frac{t}{2} \left((\partial_t u)^2 + |\nabla u + \frac{ux}{|x|^2}|^2\right) \lesssim t \left((\partial_t u)^2 + |\nabla u|^2 + \frac{u^2}{|x|^2}\right).$$  \hspace{1cm} (6-14)

Therefore by (6-14), the Hölder inequality and (1-7), we have

$$H(t) \lesssim t \left(e(t) + \int_{|x| \leq t} \frac{u^2}{|x|^2}\right) \lesssim t \left(e(t) + \left(\int_{|x| \leq t} u^6\right)^{1/3}\right) \lesssim t(e(t) + e^{1/3}(t)).$$  \hspace{1cm} (6-15)

Moreover by (6-4), the Hölder inequality and (1-7), we have

$$\frac{1}{\sqrt{2}} \int_{\partial \Gamma_+(I(a,b))} \frac{1}{t} (\partial_t u + \nabla u \cdot x + u)^2 \lesssim \frac{b}{\sqrt{2}} \int_{\partial \Gamma_+(I(a,b))} \left(\frac{\nabla u \cdot x}{t} + \partial_t u\right)^2 + \frac{1}{2\sqrt{2}} \int_{\partial \Gamma_+(I(a,b))} \left|\partial_0 u\right|^2 t^2$$

$$\lesssim b \int_{\partial \Gamma_+(I(a,b))} \left|\frac{x}{t} \partial_t u + \nabla u\right|^2 + \frac{1}{2\sqrt{2}} \left(\int_{\partial \Gamma_+(I(a,b))} u^6\right)^{1/3} \lesssim b \left((e(b) - e(a)) + (e(b) - e(a))^{1/3}\right).$$  \hspace{1cm} (6-16)

We get from (1-7)

$$4F(u) - uf(u) \leq 0.$$  \hspace{1cm} (6-17)

By (6-13), and (6-15)–(6-17), we have

$$\int_{|x| \leq b} F(u) \lesssim \frac{H(b)}{b} \lesssim \frac{H(a) + \frac{1}{\sqrt{2}} \int_{\partial \Gamma_+(I(a,b))} \frac{1}{t} (\partial_t u + \nabla u \cdot x + u)^2}{b}$$

$$\lesssim \frac{a}{b} \left(e(a) + e^{1/3}(a)\right) + e(b) - e(a) + (e(b) - e(a))^{1/3}.$$  \hspace{1cm} (6-18)

### 7. Proof of Lemma 10

The proof relies upon two results that we prove in the subsections.

**Result 16.** Let $u$ be a classical solution of (1-1). Assume that (1-28) holds. Let $\eta$ be a positive number such that (3-3) holds. If $\|u\|_{L^\infty_t L^2_x(\Gamma_+(J))} \geq \eta$ then

$$\|u\|_{L^\infty_t L^2_x(\Gamma_+(J))} \gtrsim \eta^{2} + E^{-(1/2)-1)}.$$  \hspace{1cm} (7-1)

**Result 17.** Let $u$ be a smooth solution to (1-1). Assume that (1-28) holds. Let $\eta$ be a positive number such that

$$\eta \leq \min(1, E^{1/18}).$$  \hspace{1cm} (7-2)

Let $J = [t_1, t_2]$ be an interval such that $[t_1, t_1(E\eta^{-18})^4E\eta^{-18}] \subset J$. Then there exists a subinterval $J' = [t'_1, t'_2]$ such that $|t'_2/t'_1| = E \eta^{-18}$ and

$$\|u\|_{L^\infty_t L^2_x(\Gamma_+(J'))} \lesssim \eta.$$  \hspace{1cm} (7-3)
Let $C_9$ be the constant determined by $\gtrsim$ in (7-1). Let $C_{10}$ be the constant determined by $\lesssim$ in (7-3). We get from (3-9):
\[
[t_1, t_1 \left( E \left( \frac{C_9 \eta^2 E^{-(1/2)+}}{2C_{10}} \right)^{-18} \right)^{4E} \left( \frac{C_9 \eta^2 E^{-(1/2)+}}{2C_{10}} \right)^{-18}] \subset [t_1, C_2 (E^{10+\eta^{-36+}})^4 C_2 E^{10+\eta^{-36+}} t_1] \subset J,
\]
(7-4)
if $C_2 \gg \max (C_9, C_{10})$. Therefore, since $(C_9 \eta^2 E^{-(1/2)+})/(2C_{10})$ satisfies (7-2) by (3-8), we can use Result 17 and show that there exists a subinterval $J' = [t_1', t_2']$ such that $|t_2' - t_1'| \sim E^{10+\eta^{-36+}}$ and
\[
\|u\|_{L^{t,\infty} L^6 (\Gamma_+ (J'))} \lesssim \frac{C_9 \eta^2 E^{-(1/2)+}}{2C_{10}} \leq \frac{C_9 \eta^2 E^{-(1/2)+}}{2}.
\]
(7-5)
Now we claim that $\|u\|_{L^{t,\infty} L^6 (\Gamma_+ (J'))} \lesssim \eta$. If not by (3-8) and Result 16 we have
\[
\|u\|_{L^{t,\infty} L^6 (\Gamma_+ (J'))} \gtrsim C_9 \eta^2 E^{-(1/2)+}.
\]
(7-6)
Contradiction with (7-5).

**Proof of Result 16.** We substitute $J'$ for $\Gamma_+ (J')$ in (5-1) to get
\[
\|f(u)\|_{L^{t,\infty} L^2 (\Gamma_+ (J'))} \lesssim E^{1/2}.
\]
(7-7)
By the Strichartz estimates (1-20) on the truncated cone $\Gamma_+ (J')$ we have
\[
\|u\|_{L^{t,\infty} L^{6^{(2+\epsilon)/\epsilon}} (\Gamma_+ (J'))} \lesssim E^{1/2},
\]
(7-8)
after following similar steps to prove (5-2). Therefore
\[
\eta = \|u\|_{L^{t,\infty} L^2 (\Gamma_+ (J'))} \lesssim \|u\|_{L^{t,\infty} L^{6^{(2+\epsilon)/\epsilon}} (\Gamma_+ (J'))}^{1-(2+\epsilon)/4} \|u\|_{L^{t,\infty} L^2 (\Gamma_+ (J'))}^{(2+\epsilon)/4} \lesssim E^{(2+\epsilon)/8} \|u\|_{L^{t,\infty} L^2 (\Gamma_+ (J'))}^{1-(2+\epsilon)/4} \lesssim E^{(2+\epsilon)/8} \|u\|_{L^{t,\infty} L^2 (\Gamma_+ (J'))}^{1-(2+\epsilon)/4}.
\]
(7-9)
Therefore (7-1) holds.

**Proof of Result 17.** By (7-2) we have $E \eta^{-18} \geq 1$. Let $n$ be the largest integer such that $2n \leq 4E \eta^{-18}$. This implies that $n \geq E \eta^{-18}$. Let $A := E \eta^{-18}$. Now we consider the interval $[t_1, A^{2n} t_1] \subset J$. We write $[t_1, A^{2n} t_1] = [t_1, A^2 t_1] \cup \cdots \cup [A^{2(n-1)} t_1, A^{2n} t_1]$. We have
\[
\sum_{i=1}^n e(A^{2^i} t_1) - e(A^{2^{(i-1)} t_1}) \leq 2E,
\]
(7-10)
and by the pigeonhole principle there exists $i_0 \in [1, n]$ such that
\[
e(A^{2^0 t_1}) - e(A^{2^{(i_0-1)} t_1}) \lesssim \eta^{18}.
\]
(7-11)
Now we choose $a := A^{2^{(i_0-1)} t_1}$ and $b \in [A^{2^{i_0-1} t_1}, A^{2^{i_0} t_1}]$. Let $t'_1 := A^{2^{(i_0-1)} t_1}$, $t'_1 := A^{2^{i_0-1} t_1}$ and $J' := [t'_1, t'_2]$. We apply (3-7) and (7-2) to get
\[
\|u\|_{L^{t,\infty} L^6 (\Gamma_+ ([t'_1, t'_2]))} \lesssim \|F(u)\|_{L^{t,\infty} L^6 (\Gamma_+ ([t'_1, t'_2]))} \lesssim (E^{-1} \eta^{18} (E + E^{1/3}) + \eta^{18} + \eta^6)^{1/6} \lesssim \eta.
\]
Proof of Lemma 11

We have after computation of the derivative of $e(t)$

$$\partial_t e(t) \geq \int_{|x|=r} F(u) \, dS,$$  \quad (7-12)

and integrating with respect of time

$$\int_I \int_{|x| \leq r} g(u)u_6(t', x') \, dS \, dt' \lesssim E.$$  \quad (7-13)

By using the space and time translation invariance

$$\int_J \int_{|x' - x|=|t' - t|} g(u)u_6(t', x') \, dS \, dt' \lesssim E.$$  \quad (7-14)

Therefore (1-15), (1-22), (7-14) and the Hölder inequality give us

$$\left| - \int_{J'} \frac{\sin (t - t')D}{D} g(u)u_5 \, dt' \right| = \left| \frac{1}{4\pi |t - t'|} \int_{|x' - x|=|t' - t|} g^{5/6}(u)u_5 g^{1/6}(u) \, dS \, dt' \right|
\lesssim \int_{J'} \left( \int_{|x' - x|=|t' - t|} u_6 g(u) \, dS \right)^{5/6} \left( \int_{|x' - x|=|t' - t|} g(u) \, dS \right)^{1/6} \, dt'
\lesssim g^{1/6}(M) \int_{J'} \frac{1}{|t - t'|^{2/3}} \left( \int_{|x' - x|=|t' - t|} u_6 g(u) \, dS \right)^{5/6} \, dt'
\lesssim g^{1/6}(M) E^{5/6} \left( \int_{J'} \frac{1}{|t - t'|^4} \right)^{1/6} \lesssim g^{1/6}(M) \frac{E^{5/6}}{\text{dist}^{1/2}(t, J')}.$$  \quad (7-15)

Notice that

$$u(t) = u_{i,0}(t) - \int_{t_0}^t \frac{\sin (t - t')D}{D} u_5(t')g(u(t')) \, dt',$$  \quad (7-16)

for $i = 1, 2$. We get (3-11) from (7-15) and (7-16).

PERIODIC STOCHASTIC KORTEWEG–DE VRIES EQUATION WITH ADDITIVE SPACE-TIME WHITE NOISE

TADAHIRO OH

We prove the local well-posedness of the periodic stochastic Korteweg–de Vries equation with the additive space-time white noise. To treat low regularity of the white noise in space, we consider the Cauchy problem in the Besov-type space \( \hat{b}^s_{p,\infty}(\mathbb{T}) \) for \( s = -\frac{1}{2} + \), \( p = 2 + \) such that \( sp < -1 \). In establishing local well-posedness, we use a variant of the Bourgain space adapted to \( \hat{b}^s_{p,\infty}(\mathbb{T}) \) and establish a nonlinear estimate on the second iteration on the integral formulation. The deterministic part of the nonlinear estimate also yields the local well-posedness of the deterministic KdV in \( M(\mathbb{T}) \), the space of finite Borel measures on \( \mathbb{T} \).

1. Introduction

In this paper, we prove the local well-posedness of the periodic stochastic Korteweg–de Vries (SKdV) equation with additive space-time white noise:

\[
\begin{align*}
    du + (\partial_x^3 u + u \partial_x u) dt &= dW, \\
    u(x, 0) &= u_0(x),
\end{align*}
\]

where \( u \) is a real-valued function, \((x, t) \in \mathbb{T} \times \mathbb{R}^+ \) with \( \mathbb{T} = [0, 2\pi) \), and \( W(t) = \partial B / \partial x \) is a cylindrical Wiener process on \( L^2(\mathbb{T}) \). With \( e_n(x) = \frac{1}{\sqrt{2\pi}} e^{inx} \), we have \( W(t) = \beta_0(t) e_0 + \sum_{n \neq 0} \frac{1}{\sqrt{2}} \beta_n(t) e_n(x) \), where \( \{\beta_n\}_{n \geq 0} \) is a family of mutually independent complex-valued Brownian motions (here we take \( \beta_0 \) to be real-valued) in a fixed probability space \((\Omega, \mathcal{F}, P)\) associated with a filtration \( \{\mathcal{F}_t\}_{t \geq 0} \) and \( \beta_n(t) = \beta_n(t) \) for \( n \geq 1 \). Note that \( \text{Var}(\beta_n(1)) = 2 \) for \( n \geq 1 \).

De Bouard et al. [2004] considered

\[
\begin{align*}
    du + (\partial_x^3 u + u \partial_x u) dt &= \phi dW, \\
    u(x, 0) &= u_0(x),
\end{align*}
\]

where \( \phi \) is a bounded linear operator in \( L^2(\mathbb{T}) \). They showed that (2) is locally well posed when \( \phi \) is a Hilbert–Schmidt operator from \( L^2(\mathbb{T}) \) to \( H^s(\mathbb{T}) \) for \( s > -\frac{1}{2} \). See the references in their paper for earlier work in the periodic and nonperiodic settings.

In this work, we consider the case when \( \phi \) is the identity operator on \( L^2(\mathbb{T}) \), that is, we take the additive noise to be the space-time white noise \( \partial^2 B / \partial t \partial x \), where \( B(x, t) \) is a two parameter Brownian motion on \( \mathbb{T} \times \mathbb{R}^+ \). Note that \( \phi \) is a Hilbert–Schmidt operator from \( L^2(\mathbb{T}) \) to \( H^s(\mathbb{T}) \) for \( s < -\frac{1}{2} \) but not for \( s \geq -\frac{1}{2} \).

MSC2000: 35Q53, 60H15.

Keywords: stochastic KdV, white noise, local well-posedness.
Suppose that \( u \) is the solution to (1), or equivalently to (2) with \( \phi = \text{Id} \), the identity operator on \( L^2(\mathbb{T}) \). Let \( v_1(x, t) = u(x + a_0 t, t) - a_0 \), where \( a_0 \) is the mean of \( u_0 \). Then, \( v_1 \) satisfies (1) with the mean-zero initial condition \( u_0 - a_0 \). Now, let \( P_0 \) be the projection onto the spatial frequency 0, and \( P_{n \neq 0} = \text{Id} - P_0 \). Note that \( P_0 W(t) = \beta_0(t)e_0(x) = \frac{1}{\sqrt{2\pi}}\beta_0(t) \). By letting \( v_2 = v_1 - \frac{1}{\sqrt{2\pi}}\beta_0(t) \), we see that \( u \) satisfies (1) if and only if \( v_2 \) satisfies
\[
\begin{cases}
    dv_2 + (\partial_x^3 v_2 + (v_2 + \frac{1}{\sqrt{2\pi}}\beta_0(t))\partial_x v_2)dt = P_{n \neq 0} dW, \\
v_2(x, 0) = u_0(x) - a_0,
\end{cases}
\]
avoidly surely since \( \beta_0(0) = 0 \) a.s. By setting \( v_3(x, t) = v_2(x + c_o(t), t) \) with \( c_o(t) = \int_0^t \frac{1}{\sqrt{2\pi}}\beta_0(t')dt' \), it follows that \( v_3 \) satisfies
\[
\begin{cases}
    dv_3 + (\partial_x^3 v_3 + v_3\partial_x v_3)dt = d\hat{W}, \\
v_3(x, 0) = u_0(x) - a_0,
\end{cases}
\]
where
\[
\hat{W}(x, t) = \sum_{n \neq 0} \frac{1}{\sqrt{2}}\beta_n(t)e_n(x + c_o(t)) = \sum_{n \neq 0} \frac{1}{\sqrt{2}}\beta_n(t)e^{i\omega_0(t)}e_n(x);
\]
that is, \( v_3 \) solves (2), where
\[
\phi = \text{diag}(\phi_n; n \neq 0) \quad \text{with} \quad \phi_n(t) = e^{i\omega_0(t)} \quad \text{and} \quad c_o(t) = \int_0^t \frac{1}{\sqrt{2\pi}}\beta_0(t')dt'
\]
(with respect to the basis \( \{e_n\}_{n \in \mathbb{Z}} \)). Moreover, \( v_3 \) has spatial mean 0 (as long as it exists) since \( e_0 \) does not lie in the range of \( \phi \). Therefore, in the remainder of the paper, we concentrate on studying the local well-posedness of (2) with \( \phi \) given by (3) and the mean-zero initial condition \( u_0 \) (which implies that \( u \) has spatial mean 0 as long as it exists).

Recall that \( u \) is called a (local-in-time) mild solution to (2) if \( u \) satisfies
\[
u(t) = S(t)u_0 - \frac{1}{2} \int_0^t S(t - t')\partial_x u^2(t')dt' + \int_0^t S(t - t')(\tau - n^3)\partial_x u(t')dW(t')
\]
at least for \( t \in [0, T] \) for some \( T > 0 \), where \( S(t) = e^{-t\partial_x^3} \).

Note that the first two terms in (4) also appear in the deterministic KdV theory. Thus, we briefly review recent well-posedness results of the periodic (deterministic) KdV.

\[
\begin{cases}
u_t + u_{xxx} + uu_x = 0, \\
u_{t=0} = u_0,
\end{cases}
\quad (x, t) \in \mathbb{T} \times \mathbb{R}.
\]

Bourgain [1993] introduced a new weighted space-time Sobolev space \( X^{s,b} \) whose norm is given by
\[
\|u\|_{X^{s,b}(\mathbb{T} \times \mathbb{R})} = \|\langle \tau \rangle^s (\tau - n^3)^b \tilde{u}(n, \tau)\|_{L^2_{n,\tau}(\mathbb{Z} \times \mathbb{R})},
\]
where \( \langle \cdot \rangle = 1 + |\cdot| \). He proved the local well-posedness of (5) in \( L^2(\mathbb{T}) \) via the fixed point argument, immediately yielding the global well-posedness in \( L^2(\mathbb{T}) \) thanks to the conservation of the \( L^2 \) norm. Kenig et al. [1996] improved Bourgain’s result and established the local well-posedness in \( H^{-\frac{1}{2}}(\mathbb{T}) \) by establishing the bilinear estimate
\[
\|\partial_x (uv)\|_{X^{s,b}} \lesssim \|u\|_{X^{s,b}} \|v\|_{X^{s,b}}
\]
for \( s \geq -\frac{1}{2} \) under the mean-zero assumption on \( u \) and \( v \). Colliander et al. [2003] proved the corresponding global well-posedness result via the \( I \)-method.

There are also results on (5) which exploit its complete integrability. Bourgain [1997] proved the global well-posedness of (5) in the class \( M(\mathbb{T}) \) of measures \( \mu \), assuming that its total variation \( \| \mu \| \) is sufficiently small. His proof is based on the trilinear estimate on the second iteration of the integral formulation of (5), assuming an a priori uniform bound on the Fourier coefficients of the solution \( u \) of the form

\[
\sup_{n \in \mathbb{Z}} |\hat{u}(n, t)| < C \quad \text{for all } t \in \mathbb{R}.
\]  

He then established (8) using complete integrability. More recently, Kappeler and Topalov [2006] proved the global well-posedness of the KdV in \( H^{-1}(\mathbb{T}) \) via the inverse spectral method.

There are also results on the necessary conditions on the regularity with respect to smoothness or uniform continuity of the solution map: \( u_0 \in H^s(\mathbb{T}) \mapsto u(t) \in H^s(\mathbb{T}) \). Bourgain [1997] showed that if the solution map is \( C^3 \), then \( s \geq -\frac{1}{2} \). Christ et al. [2003] proved that if the solution map is uniformly continuous, then \( s \geq -\frac{1}{2} \). (See also [Kenig et al. 2001].) These results, in particular, imply that we cannot hope to have a local-in-time solution of KdV via the fixed point argument in \( H^s \), \( s < -\frac{1}{2} \). Recall that, for each fixed \( t \), the space-time white noise \( \hat{\sigma}^2/\hat{\sigma} b/\hat{\sigma} x \) lies in \( \mathcal{L}_{L^s} H^s \setminus H^{-\frac{1}{2}} \) almost surely. Hence, these results for KdV cannot be applied to study the local well-posedness of (1).

Now, let us discuss the spaces which capture the regularities of the spatial and space-time white noise. Recently, we proved the invariance of the (spatial) white noise for the (deterministic) KdV in [Oh 2009a] (also see [Oh 2009b]) by first establishing the local-in-time white noise in an appropriate Banach space containing the support of the (spatial) white noise. Define the Besov-type space via the norm

\[
\| f \|_{\mathring{b}_{p, \infty}^s} := \| \hat{f} \|_{b_{p, \infty}^s} = \sup_n \| (n)^s \hat{f}(n) \|_{L^p_{|n|^{-2j}}} = \sup_j \left( \sum_{|n| \sim 2^j} |(n)^s \hat{f}(n)|^p \right)^{1/p}.
\]

In [Oh 2009a], using the theory of abstract Wiener spaces, we showed that \( \mathring{b}_{p, \infty}^s \) contains the full support of the (spatial) white noise for \( sp < -1 \). (The statement also holds true for \( sp = -1 \).)

Let’s consider the stochastic convolution \( \Phi(t) \) given by

\[
\Phi(t) = \int_0^t S(t - t') \phi(t') dW(t'),
\]

where \( \phi \) is given by (3). Define a variant of the \( X^{s, b}_{p, q} \) space adjusted to \( \mathring{b}_{p, \infty}^s(\mathbb{T}) \). Let \( X^{s, b}_{p, q} \) be the completion of the Schwartz class \( \mathcal{F}(\mathbb{T} \times \mathbb{R}) \) under the norm

\[
\| u \|_{X^{s, b}_{p, q}} := \| (n)^s \langle \tau - n^3 \rangle^b \hat{u}(n, \tau) \|_{b_{p, \infty}^s L_t^q}.
\]

Note that \( X^{s, b}_{p, q} \) defined in (11) is the space of functions \( u \) such that \( S(-t)u(\cdot, t) \in (\mathring{b}_{p, \infty}^s, \mathcal{F}L^{b, q})_t \), where \( \mathcal{F}L^{b, q} \) is defined via the norm

\[
\| f \|_{\mathcal{F}L^{b, q}} := \| \langle \tau \rangle^b \hat{f}(\tau) \|_{L_t^q}.
\]

In the same paper we also showed that the local-in-time white noise is supported on \( \mathcal{F}L^{c, q} \) for \( cq < -1 \). This implies that the Brownian motion belongs locally in time to \( \mathcal{F}L^{b, q} \) for \( (b - 1)q < -1 \). Hence, with
b < \frac{1}{2} \) and \( q = 2 \), we see that the local-in-time stochastic convolution \( \eta(t) \Phi(t) \) lies in \( X_{p,q}^b \) almost surely, with \( sp < -1 \), \( b < \frac{1}{2} \) and \( q = 2 \), where \( \eta(t) \) is a smooth cutoff supported on \([-1, 2] \) with \( \eta(t) \equiv 1 \) on \([0, 1] \).

The argument in [De Bouard et al. 2004] is based on the result by Roynette [1993] on the endpoint regularity of the Brownian motion, which states that the Brownian motion \( \beta(t) \) belongs to the Besov space \( B^{1/2}_{p,q} \) if and only if \( q = \infty \) (with \( 1 \leq p < \infty \)). The authors then proved a variant of the bilinear estimate (7) by Kenig, Ponce and Vega, adjusted to their Besov space setting, establishing the local well-posedness via the fixed point theorem. The use of a variant of the bilinear estimate (7) required a slight regularization of the noise in space via \( \phi \) so that the smoothed noise has the spatial regularity \( s > -\frac{1}{2} \).

Thus, they could not treat the space-time white noise, that is, \( \phi \equiv \text{Id} \).

Our result is based on two observations. First, our \( l_n^b \)-based function spaces \( \hat{b}^s_{p,\infty} \) in (9) and \( X_{p,q}^b \) in (11) capture the regularity of the spatial and space-time white noise for \( sp < -1 \), \( b < \frac{1}{2} \) and \( q = 2 \). The second is that we can indeed carry out the argument in [Bourgain 1997], a nonlinear estimate on the second iteration, without assuming the a priori bound (8), if we take the initial data \( u_0 \in \hat{b}^s_{p,\infty} \) for \( s > -\frac{1}{2} \) with \( p > 2 \). Then, we construct a solution \( u \) as a strong limit of the smooth solutions \( u^N \) (with smooth \( u_0^N \) and \( \phi^N \)) of (2). Note that our nonlinear estimate on the second iteration in Section 5 depends on the stochastic term, whereas the bilinear estimate in [De Bouard et al. 2004] is entirely deterministic.

Finally, we present our main results.

**Theorem 1.** Let \( \phi \) be as in (3) and \( p = 2+ \). Let \( s = -\frac{1}{2} + \delta \) with \( (p-2)/(4p) < \delta < (p-2)/(2p) \), so \( sp < -1 \). Also, let \( u_0 \) be \( \mathbb{F}_0 \)-measurable such that it has mean 0 and belongs to \( \hat{b}^s_{p,\infty}(\mathbb{T}) \) almost surely. Then, there exists a stopping time \( T_o > 0 \) and a unique process \( u \in C([0, T_o]; \hat{b}^s_{p,\infty}(\mathbb{T})) \) satisfying (2) on \([0, T_o]\) almost surely.

As a corollary, we obtain:

**Theorem 2.** The stochastic KdV (1) with the additive space-time white noise is locally well posed almost surely (with the prescribed mean on \( u_0 \)).

**Remark 1.1.** Our argument provides an answer to the question posed in [Bourgain 1997, remark on p. 120], at least in the local-in-time setting. The deterministic part of the nonlinear estimate in Section 5 can be used to establish the local well-posedness of (5) for a finite Borel measure \( u_0 = \mu \in M(\mathbb{T}) \) with \( \|\mu\| < \infty \) without the complete integrability or the smallness assumption on \( \mu \). Note that \( \mu \in \hat{b}^s_{p,\infty} \) for \( sp \leq -1 \) since \( \sup_n |\hat{\mu}(n)| < \|\mu\| < \infty \). Hence, it can be used to study the Cauchy problem on \( M(\mathbb{T}) \) for nonintegrable KdV-variants. Also, see [Oh 2009b].

**Remark 1.2.** Let \( \mathcal{F}L^{s,p}(\mathbb{T}) \) be the space of functions on \( \mathbb{T} \) defined via the norm \( \|f\|_{\mathcal{F}L^{s,p}} = \|n^s \hat{f}(n)\|_{L^p}. \)
Recall from [Oh 2009a] that \( \mathcal{F}L^{s,p}(\mathbb{T}) \) contains the support of the (spatial) white noise when \( sp < -1 \). Then, Theorems 1 and 2 can also be established in \( \mathcal{F}L^{s,p}(\mathbb{T}) \) for \( s = -\frac{1}{2} +, \ p = 2+ \) with \( sp < -1 \). The modification is straightforward once we note that \( \|f\|_{\mathcal{F}L^{s-\varepsilon,p}} \lesssim \|f\|_{\hat{b}^s_{p,\infty}} \) for any \( \varepsilon > 0 \), and thus we omit the details.

This paper is organized as follows: In Section 2, we introduce some notations. In Section 3, we introduce function spaces along with their embeddings and state deterministic linear estimates from [Bourgain 1993] and [Oh 2009a]. In Section 4, we study some basic properties of the stochastic convolution. In Section 5, we prove Theorem 1 by establishing the nonlinear estimate on the second iteration of the integral formulation (4).
2. Notation

In the periodic setting on $\mathbb{T}$, the spatial Fourier domain is $\mathbb{Z}$. Let $dn$ be the normalized counting measure on $\mathbb{Z}$. We say that $f \in L^p(\mathbb{Z})$, where $1 \leq p < \infty$, if
\[
\|f\|_{L^p(\mathbb{Z})} = \left(\int_{\mathbb{Z}} |f(n)|^p dn\right)^{1/p} = \left(\frac{1}{2\pi} \sum_{n \in \mathbb{Z}} |f(n)|^p\right)^{1/p} < \infty.
\]
If $p = \infty$, we have the obvious definition involving the supremum. We often drop $2\pi$ for simplicity. If a function depends on both $x$ and $t$, we use $\wedge_x$ (and $\wedge_t$) to denote the spatial (and temporal) Fourier transform, respectively. However, when there is no confusion, we simply use $\wedge$ to denote the spatial Fourier transform, the temporal Fourier transform, and the space-time Fourier transform, depending on the context.

For a Banach space $X \subset \mathcal{S}'(\mathbb{T} \times \mathbb{R})$, we use $\hat{X}$ to denote the space of the Fourier transforms of the functions in $X$, which is a Banach space with the norm $\|f\|_{\hat{X}} = \|\mathcal{F}^{-1}_n f\|_X$, where $\mathcal{F}^{-1}$ denotes the inverse Fourier transform (in $n$ and $\tau$). Also, for a space $Y$ of functions on $\mathbb{Z}$, we use $\hat{Y}$ to denote the space of the inverse Fourier transforms of the functions in $Y$ with the norm $\|f\|_{\hat{Y}} = \|\mathcal{F} f\|_Y$. Now, define $\hat{b}^{s,q}_{p,q}(\mathbb{T})$ by the norm
\[
\|f\|_{\hat{b}^{s,q}_{p,q}(\mathbb{T})} = \|\hat{f}\|_{\hat{b}^{s,q}_{p,q}(\mathbb{Z})} := \|\langle n \rangle^{s} \hat{f}(n)\|_{L^p_{|\tau|^{-2j}}}^{1/p} \sup_{j} \left(\sum_{|n| \sim 2^j} \langle n \rangle^{qs} |\hat{f}(n)|^p\right)^{1/q}.
\]
for $q < \infty$ and by (9) when $q = \infty$.

Throughout the paper, $\eta(t)$ denotes a smooth cutoff supported on $[-1, 2]$ with $\eta(t) \equiv 1$ on $[0, 1]$, and let $\eta_{s}(t) = \eta(T^{-1} t)$. We use $c$, $C$ to denote various constants, usually depending only on $s$, $p$, and $\delta$. If a constant depends on other quantities, we make it explicit. We use $A \lesssim B$ to denote an estimate of the form $A \leq CB$. Similarly, we use $A \sim B$ to denote $A \lesssim B$ and $B \lesssim A$ and use $A \ll B$ when there is no general constant $C$ such that $B \leq CA$. We also use $a+$ and $a-$ to denote $a + \varepsilon$ and $a - \varepsilon$, respectively, for arbitrarily small $\varepsilon \ll 1$.

3. Function spaces and basic embeddings

Let $X^{s,b}$ denote the usual periodic Bourgain space defined in (6). We often use the shorthand notation $\| \cdot \|_{s,b}$ to denote the $X^{s,b}$ norm. Now, define $X^{s,b}_{p,q}$, the Bourgain space adapted to $\hat{b}^{s,q}_{p,\infty}$, to be the completion of the Schwartz functions on $\mathbb{T} \times \mathbb{R}$ with respect to the norm given by
\[
\|u\|_{X^{s,b}_{p,q}} = \|\langle n \rangle^{s} (\tau - n^3)^b \hat{u}(n, \tau)\|_{L^p_{|\tau|^{-2j}}^{q/p}} = \sup_j \|\langle n \rangle^{s} (\tau - n^3)^b \hat{u}(n, \tau)\|_{L^p_{|\tau|^{-2j}}^{q/p}}.
\]
In the following, we take $p = 2+$ and $s = -\frac{1}{2} + \delta$ with $\delta < (p-2)/2p$ (and $\delta > (p-2)/4p$) such that $sp < -1$. Lastly, given $T > 0$, we define $X^{s,b,T}_{p,q}$ as a restriction of $X^{s,b}_{p,q}$ on $[0, T]$ by
\[
\|u\|_{X^{s,b,T}_{p,q}} = \|u\|_{X^{s,b}_{p,q}[0,T]} = \inf\{\|\tilde{u}\|_{X^{s,b}_{p,q}} : \tilde{u}|_{[0,T]} = u\}.
\]
We define the local-in-time versions of the other function spaces analogously.
Now, we discuss the basic embeddings. For $p \geq 2$, we have $\|a_n\|_{L^p} \leq \|a_n\|_{L^2}$ for details of the proofs. We first present the homogeneous and nonhomogeneous linear estimates. See [Bourgain 1993; Kenig et al. 1993; Oh 2009a] for details of the proofs.

**Lemma 3.1.** For any $s \in \mathbb{R}$ and $b < \frac{1}{2}$, we have $\|S(t)u_0\|_{X^{s,b,\frac{1}{2}}} \lesssim T^{(1/2) - b} \|u_0\|_{\dot{B}^b_{p,\infty}}$.

**Lemma 3.2.** For any $s \in \mathbb{R}$ and $b \leq \frac{1}{2}$, we have

$$\left\| \int_0^t S(t - t') F(x, t') dt' \right\|_{X^{s,b,\frac{1}{2}}} \lesssim \|F\|_{X^{s,b-1}} + \|F\|_{X^{s,-1}}.$$  

Also, we have $\left\| \int_0^t S(t - t') F(x, t') dt' \right\|_{X^{s,b,\frac{1}{2}}} \lesssim \|F\|_{X^{s,b-1}}$ for $b > \frac{1}{2}$.

The next lemma is the periodic $L^4$ Strichartz estimate due to Bourgain [1993].

**Lemma 3.3.** Let $u$ be a function on $\mathbb{T} \times \mathbb{R}$. Then, we have $\|u\|_{L^4_{x,t}} \lesssim \|u\|_{X^{0,\frac{1}{4}}}$.  

Lastly, recall that by restricting the Bourgain spaces onto a small time interval $[0, T]$, we can gain a small power of $T$. See [Colliander and Oh 2009] for the proof.

**Lemma 3.4.** For $0 \leq b' < b \leq \frac{1}{2}$, we have

$$\|u\|_{X^{s,b',T}} = \|\eta_T u\|_{X^{s,b',T}} \lesssim T^{b - b'} \cdot \|u\|_{X^{s,b}}.$$  

### 4. Stochastic convolution

In this section, we study basic properties of the stochastic convolution $\Phi(t)$ defined in (10). In particular, we prove that $\eta \Phi$ belongs to $X^{s,b,T}$ and is continuous from $[0, T]$ into $\dot{B}^b_{p,\infty}$ for $T \leq 1$ almost surely for $s < -\frac{1}{2}$ and $(b - 1) \cdot 2 < -1$, where $\eta(t)$ is a smooth cutoff supported on $[-1, 2]$ with $\eta(t) \equiv 1$ on $[0, 1]$.

Before stating the main results, we point out the following. Let $\phi$ be the identity operator on $L^2(\mathbb{T})$ or be as in (3). Then, we know that such $\phi$ is Hilbert–Schmidt from $L^2(\mathbb{T})$ into $H^1(\mathbb{T})$ if and only if $s < -\frac{1}{2}$. In other words, with a slight abuse of notation, define

$$\phi := \sum_{n \in \mathbb{Z}} \phi_n e_n = \sum_{n \in \mathbb{Z}} \phi_n e_n$$  

(18)
in view of $\phi = \text{diag}(\phi_n; n \neq 0)$. Then, we have $\phi \in H^s(\mathbb{T})$ if and only if $s < -\frac{1}{2}$. Moreover, we have $\|\phi\|_{HS(L^2;H^s)} = \|\phi\|_{H^s}$, where $\cdot \rightarrow_{HS(L^2;H^s)}$ denotes the Hilbert–Schmidt norm from $L^2(\mathbb{T})$ to $H^s(\mathbb{T})$. For such $\phi$, we also have $\phi \in \dot{\mathcal{B}}_{\beta,\infty}(\mathbb{T})$ if and only if $sp \leq -1$, and we can use $\|\phi\|_{\dot{\mathcal{B}}_{\beta,\infty}}$ to discuss the regularity of $\phi$ in place of the Hilbert–Schmidt norm. This is one of the reasons for using this space. (We need only $sp \leq -1$ for our purpose since the nonlinear estimate in Section 5 holds for $s = -\frac{1}{2}$ and $p = 2+\text{ with } sp < -1$.)

**Proposition 4.1.** Let $0 < T \leq 1$ and $p = 2+$. Let $s = -\frac{1}{2}+\delta$ and $b = \frac{1}{2} - \delta$, with $(p-2)/4p < \delta < (p-2)/2p$ such that $sp < -1$ and $(b-1) \cdot 2 < -1$. Then, for the stochastic convolution $\Phi(t)$ defined in (10) with $\phi$ as in (3), we have

$$
\mathbb{E}[\|\eta\Phi\|_{X_{p,2}^{s,b,T}}] \leq C(\eta, s, p) < \infty. \tag{19}
$$

In particular, $\Phi \in X_{p,2}^{-\frac{1}{2}+\delta,\frac{1}{2}-\delta,T}$ almost surely.

Before going into the proof of Proposition 4.1, recall the following. Let $\beta_1$ and $\beta_2$ be independent real-valued Brownian motions on $(\Omega, \mathcal{F}, P)$, and $f_1(t, \omega)$ and $f_2(t, \omega)$ be real-valued stochastic processes independent of $\beta_1$ and $\beta_2$. Then, we can regard $b_j$ and $f_j$ as $b_j(t, \omega) = b_j(t, \omega_1)$ and $f_j(t, \omega) = f_j(t, \omega_2)$, where $\omega = (\omega_1, \omega_2) \in \Omega_1 \times \Omega_2 = \Omega$. Thus, in taking an expectation, we can first integrate over $\omega_1 \in \Omega_1$. Then, for $m \in \mathbb{N}$, we have

$$
\mathbb{E}
\left[
\left|
\int_a^b f_1(t) d\beta_1(t) + \int_a^b f_2(t) d\beta_2(t)
\right|^2
\right]^{\frac{2m}{2n}}
\mathbb{E}
\left[
\sum_{k=0}^{2m} \binom{2m}{k} \left(r_a^b f_1(t) d\beta_1(t)\right)^k \left(r_a^b f_2(t) d\beta_2(t)\right)^{2m-k}
\right]^{\frac{2n}{2n}}
\mathbb{E}
\left[
\sum_{m=0}^{m} \binom{m}{2m} (2n)! \left(f_1(\cdot, \omega_2)\right)^{\frac{2n}{2m}} \left(f_2(\cdot, \omega_2)\right)^{\frac{2m-n}{2m-n}(m-n)!}
\right]. \tag{20}
$$

In the computation above, we used the fact that, for each fixed $\omega_2$, $\int_a^b f_j(t, \omega_2) d\beta_j(t, \omega_1)$ is a Gaussian random variable on $\Omega_1$ with variance $\|f_j(\cdot, \omega_2)\|_{L^2(a,b)}^2$.

**Proof.** By the Hölder inequality, we have

$$
\left\|\tau - n^3\right\|_{L^2_i} \leq \left\|\tau - n^3\right\|_{L^2_i}^{-2\delta} \left\|\tau - n^3\right\|_{L^2_i}^{-2\delta} \left\|n^3\right\|_{L^2_i}^{2\delta} \left\|\tau - n^3\right\|_{L^2_i}^{-2\delta},
$$

that is, we have $\|\eta\Phi\|_{X_{p,2}^{s,1/2-\delta}} \leq \|\eta\Phi\|_{X_{p,2}^{s,1/2+\delta}}$ as long as $\delta > (p-2)/4p$. Thus, we will work in $X_{p,2}^{s,1/2+\delta}$ in the following.

Define $g(t) = \eta(t) \int_0^t S(-\tau) \phi(\tau) dW(\tau)$ such that $\eta(t) \Phi(\cdot, t) = S(t) g(\cdot, t)$. Assume that each $\beta_n$ is extended to a Brownian motion on $\mathbb{R}$ in such a way that the family $\{\beta_n\}_{n \geq 0}$ is still independent. Note that for $t \in [0, T]$, we have

$$
\hat{g}(n, t) = \eta(t) \int_0^t \eta(\tau) e^{-ir^3 \phi_n(\tau)} \chi_{[0,T]}(\tau) \frac{1}{\sqrt{2}} d\beta_n(\tau). \tag{21}
$$

We have inserted $\eta(r)$ and $\chi_{[0,T]}(r)$ in the integrand since $\eta(r) \chi_{[0,T]}(r) \equiv 1$ for $r \in [0, T] \subset [0, T]$. For notational simplicity, we use $\phi_n(r)$ to denote $\phi_n(r) \chi_{[0,T]}(r)$ in the following, that is, we assume that $\phi_n$ is supported on $[0, T]$. By (3), we have $|\phi_n(r)| \leq 1$ for $r \in \mathbb{R}$.
Now, we write the left-hand side of (19) as
\[ \mathbb{E} \left[ \|\eta\Phi\|_{X^{s,1+\delta,\tau}} \right] \lesssim \mathbb{E} \left[ \sup_j 2^{js} \left( \sum_{|n| \sim 2^j} \sum_{k=1}^{\infty} 2^{kp(\frac{1}{2}+\delta)} \int_{|\tau| \sim 2^k} |\hat{g}(n, \tau)|^p d\tau \right)^{1/p} \right] \]
\[ + \mathbb{E} \left[ \sup_j 2^{js} \left( \sum_{|n| \sim 2^j} \int_{|\tau| \lesssim 2} |\hat{g}(n, \tau)|^p d\tau \right)^{1/p} \right]. \quad (22) \]

**Part 1.** First, we estimate the second term in (22). Let
\[ G_n(r, \tau) = \eta(r) e^{-irn^3} \phi_n(r) \int_{-\infty}^{\infty} \eta(t) e^{-irit} dt. \quad (23) \]
Also write \( \beta_n = \beta_n^{(r)} + i\beta_n^{(i)} \) where \( \beta_n^{(r)} = \text{Re} \beta_n \) and \( \beta_n^{(i)} = \text{Im} \beta_n \). Then, by the stochastic Fubini Theorem, we have, for \( m \in \mathbb{N} \),
\[ \mathbb{E} \left[ |\hat{g}(n, \tau)|^{2m} \right] = \mathbb{E} \left[ \left| \int_{\mathbb{R}} \eta(t) e^{-it\tau} \int_{-\infty}^{t} \eta(r) e^{-irn^3} \phi_n(r) \frac{1}{\sqrt{2}} d\beta_n(r) dt \right|^{2m} \right] \]
\[ = 2^{-m} \mathbb{E} \left[ \left| \int_{-1}^{2} G_n(r, \tau) d\beta_n(r) \right|^{2m} \right] \]
\[ \lesssim \mathbb{E} \left[ \left| \int_{-1}^{2} \text{Re} G_n(r, \tau) d\beta_n^{(r)}(r) \right|^{2m} \right] \]
\[ + \mathbb{E} \left[ \left| \int_{-1}^{2} \text{Im} G_n(r, \tau) d\beta_n^{(i)}(r) \right|^{2m} \right]. \quad (24) \]
Note that \( |\text{Re} G_n(r, \tau)|, |\text{Im} G_n(r, \tau)| \leq |G_n(r, \tau)| \leq \|\eta\|_{L^1} |\phi_n(r)| \lesssim \|\eta\|_{L^1} \chi_{[0, \tau]}(r) \). Thus, we have
\[ \|\text{Re} G_n(r, \tau)\|_{L^2_{\tau}}^{2k} \|\text{Im} G_n(r, \tau)\|_{L^2_{\tau}}^{2(m-k)} \lesssim \|\eta\|_{L^1}^{2m} \]
for \( k = 0, \ldots, m \). Then, by (20) along with the independence of \( \phi_n, \beta_n^{(r)}, \) and \( \beta_n^{(i)} \), we have
\[ \|\hat{g}(n, \tau)\|_{L^{2m}(\Omega)} \leq C = C(\eta, m) \]
independent of \( n \) and \( \tau \). Hence, for \( p \in (2, 4) \), we have
\[ \left( \mathbb{E} \left[ |\hat{g}(n, \tau)|^p \right] \right)^{1/p} \leq \|\hat{g}(n, \tau)\|_{L^2_{\tau}(\Omega)}^{\theta} \|\hat{g}(n, \tau)\|_{L^{2m}_{\tau}(\Omega)}^{1-\theta} \lesssim 1 \quad (25) \]
by interpolation, where \( \theta \in (0, 1) \) such that \( \frac{1}{p} = \frac{\theta}{2} + \frac{1-\theta}{4} \). Then, the second term in (22) is estimated by
\[ (22) \leq \left( \sum_{j=0}^{\infty} 2^{jsp} \sum_{|n| \sim 2^j} \int_{|\tau| \lesssim 2} \mathbb{E} \left[ |\hat{g}(n, \tau)|^p \right] d\tau \right)^{1/p} \]
\[ \lesssim \left( \sum_{j=0}^{\infty} 2^{jsp} \sum_{|n| \sim 2^j} \right)^{1/p} \left( \sum_{j=0}^{\infty} 2^{j(2+p)} \right)^{1/p} \leq C < \infty, \quad (26) \]
since \( sp < -1 \).
Part 2. Next, we estimate the first term in (22). Let

\[
\begin{align*}
G_n^{(1)}(r, \tau) &= \eta(r)e^{-i\tau r^3}\phi_n(r) \int_{r^3}^{\infty} \eta'(t)(e^{-it}/i\tau)dt, \\
G_n^{(2)}(r, \tau) &= \eta^2(r)e^{-i\tau r^3}\phi_n(r)(e^{-it}/i\tau).
\end{align*}
\]

(27)

Then, by the stochastic Fubini theorem and integration by parts, we have

\[
\sqrt{2}\hat{g}(n, \tau) = \int_{-1}^{1} G_n(r, \tau)d\beta_n(r) = \int_{-1}^{1} G_n^{(1)}(r, \tau)d\beta_n(r) + \int_{-1}^{1} G_n^{(2)}(r, \tau)d\beta_n(r)
\]

=: I_n^{(1)}(\tau) + I_n^{(2)}(\tau).

Thus \(|\hat{g}(n, \tau)|^p \lesssim |I_n^{(1)}(\tau)|^p + |I_n^{(2)}(\tau)|^p\).

First, we estimate the contribution from \(G_n^{(1)}(r, \tau)\). For \(|\tau| \sim 2^k\), we have

\[
\left|\int_{r}^{\infty} \eta'(t) e^{-it}/i\tau dt\right| \leq |\tau^{-2} \eta'(r)| + \left|\int_{r}^{\infty} \eta''(t) e^{-it}/\tau^2 dt\right| \leq C_\eta 2^{-2k}
\]

(29)

by partial integration. Thus, we have \(|G_n^{(1)}(r, \tau)| \lesssim 2^{-2k}\). Then, repeating a similar computation as in Part 1, we obtain

\[
\left(\mathbb{E}[|I_n^{(1)}(\tau)|^p]\right)^{1/p} \leq \|I_n^{(1)}(\tau)\|_{L^2(\Omega)}^0 \|I_n^{(1)}(\tau)\|_{L^4(\Omega)}^{1/2} \lesssim 2^{-2k},
\]

(30)

by (20) and interpolation. Hence, the contribution to (22) is estimated by

\[
(22) \lesssim \left(\sum_{j=0}^{\infty} 2^{jsp} \sum_{|n| \sim 2^j} \sum_{k=1}^{\infty} 2^{kp(1+\delta)} \int_{|\tau| \sim 2^k} \mathbb{E}[|I_n^{(1)}(\tau)|^p] d\tau\right)^{1/p}
\]

\[
\lesssim \left(\sum_{j=0}^{\infty} 2^{j(sp+1)} \sum_{k=1}^{\infty} 2^{k((-3p/2)+\delta p+1)}\right)^{1/p} \leq C < \infty,
\]

(31)

since \(sp < -1\) and \(-3/2 + \delta p + 1 < 0\).

Now, we consider the contribution from \(I_n^{(2)}(\tau)\). With \(\beta_n = \beta_n^{(r)} + i\beta_n^{(i)}\), we have \(|I_n^{(2)}(\tau)|^2 \lesssim \left|\int_{-1}^{1} G_n^{(2)}(r, \tau)d\beta_n^{(r)}(r)\right|^2 + \left|\int_{-1}^{1} G_n^{(2)}(r, \tau)d\beta_n^{(i)}(r)\right|^2\). We only estimate the first term since the second term is estimated in the same way. By the Ito formula (see [De Bouard et al. 2004]), we have

\[
\left|\int_{-1}^{1} G_n^{(2)}(r, \tau)d\beta_n^{(r)}(r)\right|^2 = \int_{-1}^{1} \eta^4(t)\phi_n(t)^2 dt + 2 \text{Re} \int_{-1}^{1} \int_{-\infty}^{t} G_n^{(2)}(r, \tau)d\beta_n^{(r)}(r)G_n^{(2)}(t, \tau)d\beta_n^{(r)}(t)
\]

=: \(I_n^\prime(\tau) + I_n^{''}(\tau)\).

The contribution from \(I_n^\prime(\tau)\) is at most

\[
(22) \lesssim \left(\sum_{j=0}^{\infty} 2^{jsp} \sum_{|n| \sim 2^j} \sum_{k=1}^{\infty} 2^{kp(1+\delta)} \int_{|\tau| \sim 2^k} |\tau|^{-p} d\tau \left(\int_{-1}^{1} \eta^4(t) dt\right)^{p/2}\right)^{1/p}
\]

\[
\lesssim \|\eta\|_{L^4}^2 \left(\sum_{j=0}^{\infty} 2^{j(sp+1)} \sum_{k=1}^{\infty} 2^{k((-3p/2)+\delta p+1)}\right)^{1/p} \leq C < \infty,
\]

(32)

since \(sp < -1\) and \(\delta < (p-2)/2p\).
We finally estimate the contribution from $I''_n(\tau)$. Write

$$I''_n(\tau) = \int_{-1}^{2} H_n(t) d\beta_n^{(r)}(t),$$

where $H_n(t) = \int_{-\infty}^{t} \tilde{H}_n(r, t) d\beta_n^{(r)}(r)$ with

$$\tilde{H}_n(r, t) = 2\tau^{-2} \Re(\eta^2(r)\eta^2(t)e^{i(t-r)\beta(r)}e^{i(t-r)\tau}).$$

(33)

Then, by the Ito isometry and $|\phi_n(\omega, t)| \leq 1$ for all $(\omega, t) \in \Omega \times \mathbb{R}$, we have

$$\mathbb{E}[|I''_n(\tau)|^2] = \mathbb{E}\left[\left(\int_{-1}^{2} H_n(t) d\beta_n^{(r)}(t)\right)^2\right] \sim \int_{-1}^{2} \mathbb{E}[H_n^2(t)] dt$$

$$= \int_{-1}^{2} \mathbb{E}\left[\left(\int_{-\infty}^{t} \tilde{H}_n(r, t) d\beta_n^{(r)}(r)\right)^2\right] dt = \int_{-1}^{2} \int_{-\infty}^{t} \mathbb{E}[|\tilde{H}_n(r, t)|^2] dr dt$$

$$\lesssim \tau^{-4} \int_{-1}^{2} \int_{-\infty}^{t} \eta^4(r)\eta^4(t) dr dt \lesssim \tau^{-4}.$$  

(34)

Hence, the contribution from $I''_n(\tau)$ is at most

$$(22) \lesssim \left(\sum_{j=0}^{\infty} 2^{jsp} \sum_{|n| \sim 2^j} \sum_{k=1}^{\infty} 2^{kp(\frac{1}{2} + \delta)} \int_{|\tau| \sim 2^k} \mathbb{E}[|I''_n(\tau)|^{p/2}] d\tau\right)^{1/p}$$

$$\lesssim \left(\sum_{j=0}^{\infty} 2^{jsp} \sum_{|n| \sim 2^j} \sum_{k=1}^{\infty} 2^{kp(\frac{1}{2} + \delta)} \int_{|\tau| \sim 2^k} \left(\mathbb{E}[|I''_n(\tau)|^2]\right)^{p/4} d\tau\right)^{1/p}$$

$$\lesssim \left(\sum_{j=0}^{\infty} 2^{j(s+p+1)} \sum_{k=1}^{\infty} 2^{k(-\frac{5}{2} + \phi p + 1)}\right)^{1/p} \leq C < \infty,$$

(35)

for $p \leq 4$, $sp < -1$, and $\delta < (p-2)/2p$.

We state a corollary to the proof of Proposition 4.1 for a general diagonal covariance operator $\phi(t, \omega) = \text{diag}(\phi_n(t, \omega); n \in \mathbb{Z})$, which is independent of $\{\beta_n\}_{n \geq 1}$.

**Corollary 4.2.** Let $0 < T \leq 1$, $p = 2+$, and $s, s' \in \mathbb{R}$ with $s < s'$. Moreover, let $b = \frac{1}{2} - \delta$ with $(p-2)/4p < \delta < (p-2)/2p$, so $(b-1) \cdot 2 < -1$. Then, for the stochastic convolution $\Phi(t)$ defined in (10) with $\phi \in L^p([0, T] \times \Omega; \hat{\gamma}^s_{p, \infty})$, independent of $\{\beta_n\}_{n \geq 1}$, we have

$$\mathbb{E}\left[\|\eta\Phi\|_{X^{s, p, 2}_{\beta, T}}\right] \leq C(\eta, s, s', p)\|\phi\|_{L^p([0, T] \times \Omega; \hat{\gamma}^s_{p, \infty})}.$$  

(36)

In particular, $\Phi \in X^{s, 1-\delta, T}_{p, 2}$ almost surely.

**Proof.** In the proof of Proposition 4.1, we used $|\phi_n(t)| \leq 1$ whenever $\phi_n(t)$ appeared. Now, we briefly go through that proof, keeping track of $\phi_n(t)$. Since $\phi$ is independent of $\{\beta_n\}_{n \geq 1}$, we regard $\beta_n$ and $\phi_n$ as $\beta_n(t, \omega) = \beta_n(t, \omega_1)$ and $\phi_n(t, \omega) = \phi_n(t, \omega_2)$, where $\omega = (\omega_1, \omega_2) \in \Omega_1 \times \Omega_2 = \Omega$. 

In (25), we have $\mathbb{E}[|\hat{g}(n, \tau)|^p] \lesssim \mathbb{E}_{\Omega_2} \|\phi_n(\cdot, \omega_2)\|_{L^2[0,T]}^p$. Then, in (26), we have

$$
(22) \leq \left( \sum_{j=0}^{\infty} 2^{jsp} \sum_{|n| \sim 2^j} \int_{|r| \leq 2} \mathbb{E}_{\Omega_2} \|\phi_n(\cdot, \omega_2)\|_{L^2[0,T]}^p dr \right)^{1/p} \\
\leq \left( \sum_{j=0}^{\infty} 2^{(s-s')p} 2^{jsp} \sum_{|n| \sim 2^j} \|\phi_n(\cdot, \omega_2)\|_{L^p([0,T] \times \Omega_2)}^p \right)^{1/p} \lesssim \|\phi\|_{L^p([0,T] \times \Omega; \mathbb{H}_{p, \infty})},
$$

since $s-s' < 0$. A similar modification in (30) and (31) (alternatively, (32)) takes care of the contribution from $I_n^{(1)}(\tau)$ (alternatively, $I_n'(\tau)$). Now, as for $I_n''(\tau)$, we first integrate only over $\Omega_1$ in (34) and obtain

$$
\mathbb{E}_{\Omega_1}[|I_n''(\tau)|^2] \lesssim r^{-4} \int_{-1}^2 \int_{-1}^r \eta^4(r) \eta^4(t) |\phi_n(r)|^2 |\phi_n(t)|^2 dr dt \lesssim r^{-4} \|\phi_n\|_{L^2[0,T]}^4.
$$

Then, in (35), we have

$$
\mathbb{E}[|I_n''(\tau)|^{p/2}] = \mathbb{E}_{\Omega_1}[|I_n''(\tau)|^{p/2}] \leq \mathbb{E}_{\Omega_1}[\|I_n''(\tau)\|_{L^2(\Omega_1)}^{p/2}] \lesssim r^{-p} \mathbb{E}_{\Omega_1}[\|\phi_n(\cdot, \omega_2)\|_{L^2[0,T]}^p]
$$

for $p \in [2, 4]$. The rest follows as before. \( \square \)

Now, we discuss the continuity of the stochastic convolution. In the remaining of this section, we show that the stochastic convolution $\Phi(t)$ defined in (10) belongs to $C([0, T]; \mathbb{H}_{p, \infty}(\mathbb{T})$ almost surely. With $\beta_n = \beta_n^{(r)} + i \beta_n^{(i)}$, we have

$$
\Phi(t) = \frac{1}{\sqrt{2}} \sum_{n \neq 0} \int_0^t S(t-r) \phi_n(r) e_n d\beta_n^{(r)}(r) + i \frac{1}{\sqrt{2}} \sum_{n \neq 0} \int_0^t S(t-r) \phi_n(r) e_n d\beta_n^{(i)}(r),
$$

(37)

since $\phi_0 = 0$ and $\phi_n e_n = \phi_n e_n$, $n \neq 0$. In the following, we only show the continuity of the first stochastic convolution in (37), which we denote by $\Phi^{(r)}(t)$. Also, let $W^{(r)}(t) = \frac{1}{\sqrt{2}} \sum_0^\infty \beta_n^{(r)}(t) e_n$. As in [Da Prato 2004], we use the factorization method based on the elementary identity

$$
\int_{r}^{t} (t-t')^{a-1}(t'-r)^{-a} dt' = \frac{\pi}{\sin \pi a}
$$

(38)

with $a \in (0, 1)$ for $0 \leq r \leq t' \leq t$. Using (38), we can write the first term in (37) as

$$
\Phi^{(r)}(t) = \frac{\sin \pi a}{\pi} \int_0^t S(t-t')(t-t')^{a-1} Y(t') dt',
$$

(39)

where

$$
Y(t') = \int_0^{t'} S(t' - r)(t' - r)^{-a} \phi(r) dW^{(r)}(r).
$$

(40)

First, we present a lemma that provides a criterion for the continuity of (39) in terms of the $L^{2m}$-integrability of $Y(t')$.

**Lemma 4.3** [Da Prato 2004, Lemma 2.7]. Let $T > 0$, $a \in (0, 1)$, and $m > \frac{1}{2a}$. For $f \in L^{2m}([0, T]; \mathbb{H}_{p, \infty}(\mathbb{T}))$, let

$$
F(t) = \int_0^t S(t-t')(t-t')^{a-1} f(t') dt', \quad 0 \leq t \leq T.
$$
Then, \( F \in C([0, T]; \hat{b}^s_{p, \infty}(\mathbb{T})) \). Moreover, there exists \( C = C(m, T) \) such that
\[
\|F(t)\|_{\hat{b}^s_{p, \infty}} \leq C\|f\|_{L^{2m}([0, T]; \hat{b}^s_{p, \infty})}, \quad 0 \leq t \leq T.
\]

**Remark 4.4.** Although Da Prato states his Lemma 2.7 for a Hilbert space \( H \), his proof makes no use of the Hilbert space structure of \( H \). Thus the same result holds for \( \hat{b}^s_{p, \infty}(\mathbb{T}) \) as well.

In view of Lemma 4.3, it suffices to show that \( Y(t') \in L^{2m}([0, T]; \hat{b}^s_{p, \infty}(\mathbb{T})) \) a.s.

**Proposition 4.5.** Let \( T > 0, m \geq 2, s = -\frac{1}{2} +, \) and \( p = 2 + \) such that \( sp < -1 \). Let \( \phi \) be as in (3). Then, the stochastic convolution \( \Phi^{(r)}(t) \) is continuous from \( [0, T] \) into \( \hat{b}^s_{p, \infty} \) almost surely. Moreover, there exists
\[
\mathbb{E}\left( \sup_{t \in [0, T]} \|\Phi^{(r)}(t)\|^{2m}_{\hat{b}^s_{p, \infty}} \right) \leq C(m, T, s, p) < \infty.
\]

**Proof.** Let \( \alpha \in (\frac{1}{2m}, \frac{1}{2}) \) and \( Y \) as in (40). First, note that \( Y \) is real-valued since \( \phi_{-n}(s)e_{-n} = \overline{\phi_n(s)}e_n \) and \( \beta_n^{(r)} = \beta_n^{(r)} \). Note that \( \{\beta_n^{(r)}\}_{n \neq 0} \) and \( \phi \) are independent since \( \phi \) depends only on \( \beta_0 \). Thus, we can regard \( \beta_n^{(r)} \) and \( \phi \) as \( \beta_n^{(r)}(\omega) = \beta_n^{(r)}(\omega_1) \) and \( \phi(\omega) = \phi(\omega_2) \), where \( \omega = (\omega_1, \omega_2) \in \Omega_1 \times \Omega_2 = \Omega \). Then, for each fixed \( \omega_2 \) and \( t' \in [0, t] \), \( Y(t')(n) \) is a Gaussian random variable on \( \Omega_1 \) with \( \text{Var}_{\Omega_1}(Y(t')(n)) = \mathbb{E}_{\Omega_1}[|Y(t')(n)|^2] \).

Let \( \beta_n(r, \omega_2) = (t' - r)^{-\alpha} e^{i(t' - r)\alpha} \phi_n(r, \omega_2) \). Note that \( |G_n(r, \omega_2)| = (t' - r)^{-\alpha} \) for \( 0 < r < t' \) and \( n \neq 0 \). By the Itô isometry, we have
\[
\mathbb{E}_{\Omega_1}[|Y(t')(n)|^2] = \frac{1}{2} \mathbb{E}_{\Omega_1} \left[ \int_0^{t'} |G_n(r, \omega_2)| d\beta(r, \omega_1) \right]^2 = \frac{1}{2} \int_0^{t'} |G_n(r, \omega_2)|^2 dr \sim \int_0^{t'} (t' - r)^{-2\alpha} dr.
\]

By the Minkowski integral inequality (with \( p = 2 + < 2m \)) after replacing \( \sup_j \) by \( \sum_j \), we have
\[
\mathbb{E}_{\Omega_1}(\|Y(t', \cdot, \omega_2)\|^{2m}_{\hat{b}^s_{p, \infty}}) = \mathbb{E}_{\Omega_1} \left[ \left( \sup_j \sum_{|n| \leq 2^j} \langle n \rangle^{sp} |Y(t')(n)|^p \right)^{2m/p} \right]
\leq \left( \sum_{j=0}^{\infty} \sum_{|n| \leq 2^j} 2^{jsp} \mathbb{E}_{\Omega_1}[|Y(t')(n)|^{2m}] \right)^{p/2m} \left( \sum_{j=0}^{\infty} 2^{j(s+1)p/2m} \left( \int_0^{t'} (t' - r)^{-2\alpha} dr \right)^{m} \right)^{m} \lesssim \left( \frac{(t')^{1-2\alpha}}{1-2\alpha} \right)^{m},
\]
since \( sp < -1 \). Therefore
\[
\int_0^T \mathbb{E}_{\Omega_2}(\|Y(t')\|^{2m}_{\hat{b}^s_{p, \infty}}) dt' = \int_0^T \mathbb{E}_{\Omega_2} \mathbb{E}_{\Omega_1}(\|Y(t')\|^{2m}_{\hat{b}^s_{p, \infty}}) dt' \lesssim \int_0^T \left( \frac{(t')^{1-2\alpha}}{1-2\alpha} \right)^m dt' \lesssim T^{(1-2\alpha)m+1} < C(m, T, s, p) < \infty.
\]

In particular, it follows that \( Y(\cdot, \omega) \in L^{2m}([0, T]; \hat{b}^s_{p, \infty}) \) almost surely. Then, the desired result follows from Lemma 4.3.

\[\Box\]
5. Nonlinear estimate on the second iteration

Now, we present the crucial nonlinear analysis. First, we briefly go over Bourgain’s argument [1997]. By writing the integral equation, the deterministic KdV (5) is equivalent to

\[ u(t) = S(t)u_0 - \frac{1}{2} \mathcal{N}(u, u)(t), \]

where \( \mathcal{N}(\cdot, \cdot) \) is given by

\[ \mathcal{N}(u_1, u_2)(t) := \int_0^t S(t - t')\partial_x(u_1u_2)(t')dt'. \]

In the following, we assume that the initial condition \( u_0 \) has mean 0, which implies that \( u(t) \) has spatial mean 0 for each \( t \in \mathbb{R} \). We use \((n, \tau), (n_1, \tau_1), \) and \((n_2, \tau_2)\) to denote the Fourier variables for \( uu \), the first factor, and the second factor \( u \) of \( uu \) in \( \mathcal{N}(u, u) \), respectively, thus we have \( n = n_1 + n_2 \) and \( \tau = \tau_1 + \tau_2 \). By the mean-zero assumption on \( u \) and since we have \( \partial_x(uu) \) in the definition of \( \mathcal{N}(u, u) \), we assume \( n, n_1, n_2 \neq 0 \). We also use the following notation:

\[ \sigma_0 := \langle \tau - n^3 \rangle \quad \text{and} \quad \sigma_j := \langle \tau_j - n_j^3 \rangle. \]

One of the main ingredients is the observation due to Bourgain [1993]:

\[ n^3 - n_1^3 - n_2^3 = 3nn_1n_2 \quad \text{for} \quad n = n_1 + n_2, \]

which in turn implies that

\[ \text{MAX} := \max(\sigma_0, \sigma_1, \sigma_2) \gtrsim \langle nn_1n_2 \rangle. \]

Now, define

\[ A_j = \{(n, n_1, n_2, \tau, \tau_1, \tau_2) \in \mathbb{Z}^3 \times \mathbb{R}^3 : \sigma_j = \text{MAX} \}, \]

and let \( \mathcal{N}_j(u, u) \) denote the contribution of \( \mathcal{N}(u, u) \) on \( A_j \). By the standard bilinear estimate as in [Bourgain 1993; Kenig et al. 1996], we have

\[ \|\mathcal{N}(u, u)\|_{\frac{1}{2} + \frac{1}{2} - \frac{1}{2} - \frac{1}{2}} \leq o(1)\|u\|^2_{\frac{1}{2} - \frac{1}{2} - \frac{1}{2} - \frac{1}{2}}, \]

where \( o(1) = T^\theta \) with some \( \theta > 0 \) by considering the estimate on a short time interval \([-T, T]\) (for example, Lemma 3.4). See (2.17), (2.26), and (2.68) in [Bourgain 1997]. Here, we abuse the notation and use \( \| \cdot \|_{s, b} = \| \cdot \|_{X^{s, b}} \) to denote the local-in-time version as well. Note that the temporal regularity \( b \) equals \( \frac{1}{2} - \delta < \frac{1}{2} \). This allows us to improve the spatial regularity by \( 2\delta \). Clearly, we cannot expect to do the same for \( \mathcal{N}_1(u, u) \). (By symmetry, we do not consider \( \mathcal{N}_2(u, u) \) in the following.) The bilinear estimate (7) is known to fail for any \( s \in \mathbb{R} \) if \( b < \frac{1}{2} \) due to the contribution from \( \mathcal{N}_1(u, u) \) [Kenig et al. 1996]. Following the notation in [Bourgain 1997], let

\[ I_{s, b} = \|\mathcal{N}_1(u, u)\|_{X^{s, b}} \quad \text{and} \quad \alpha := \frac{1}{2} - \delta < \frac{1}{2}. \]

Then, by Lemma 3.2 and duality with \( \|d(n, \tau)\|_{L^2_{s, t}} \leq 1 \), we have

\[ I_{-\alpha, 1-\alpha} = \|\mathcal{N}_1(u, u)\|_{-\alpha, 1-\alpha} \lesssim \sum_{n=n_1+n_2} \int_0^1 d\tau d\tau_1 \frac{(n)_1^{1-\alpha}d(n, \tau)}{\sigma_0^\alpha} \hat{u}(n, \tau_1) \frac{(n_2)_2^{1-\alpha}c(n_2, \tau_2)}{\sigma_2^\alpha}, \]
where
\[ c(n_2, \tau_2) = \langle n_2 \rangle^{-(1-\alpha)} \sigma_2^a \hat{\sigma}(n_2, \tau_2) \] so that \( \|c\|_{L^2_\alpha} = \|u\|_{-(1-\alpha),a} = \|u\|_{-\frac{1}{2} - \delta, \frac{1}{2} - \delta}. \) (49)

The main idea here is to consider the second iteration, that is, substitute (41) for \( \hat{u}(n_1, \tau_1) \) in (48), thus leading to a trilinear expression. Since \( \sigma_1 = \text{MAX} \gtrsim \langle nn_1n_2 \rangle \gg 1 \) on \( A_1, \) we can assume that
\[ \hat{u}(n_1, \tau_1) = (N(u, u))^\wedge(n_1, \tau_1) \sim \frac{|n_1|}{\sigma_1} \sum_{n_1=n_3+n_4} \int \hat{u}(n_3, \tau_3) \hat{u}(n_4, \tau_4) d\tau_4. \] (50)

Note that \( \hat{u}(n_1, \tau_1) \) cannot come from \( S(t)u_0 \) of (41) since we have \( \sigma_1 \sim 1 \) for the linear part. Moreover, by the standard computation \( [\text{Bourgain 1993}], \) we have
\[
N(u, u)(x, t) = -i \sum_{k=1}^{\infty} \frac{i^k t^k}{k!} \sum_{n \neq 0} e^{i(nx+n^3t)} \int \eta(\lambda - n^3) \hat{u}_\alpha u^2(n, \lambda) d\lambda \\
+ i \sum_{n \neq 0} e^{inx} \int \frac{(1 - \eta)(\tau - n^3)}{\tau - n^3} \hat{u}_\alpha u^2(n, \tau) e^{ixt} d\tau \\
+ i \sum_{n \neq 0} e^{i(nx+n^3t)} \int \frac{(1 - \eta)(\lambda - n^3)}{\lambda - n^3} \hat{u}_\alpha u^2(n, \lambda) d\lambda
=: M_1(u, u)(x, t) + M_2(u, u)(x, t) + M_3(u, u)(x, t). \] (51)

Note that \( (M_1(u, u))^\wedge(n_1, \tau_1) \) and \( (M_3(u, u))^\wedge(n_1, \tau_1) \) are distributions supported on \( [\tau_1 - n_3^3 = 0], \) so \( \sigma_1 \sim 1. \) Hence, the only contribution for the second iteration on \( A_1 \) comes from \( M_2(u, u) \) whose Fourier transform is given in (50). This shows the validity of the assumption (50).

The \( \sigma_1 \) appearing in the denominator allows us to cancel \( \langle n \rangle^{1-\alpha} \) and \( \langle n_2 \rangle^{1-\alpha} \) in the numerator in (48). Then, \( I_{-\alpha,1-\alpha} \) can be estimated by
\[
\lesssim \sum_{n=n_1+n_2}^{n_1+n_3+n_4} \int \frac{\langle n \rangle^{1-\alpha} d(n, \tau) |n_1|}{\sigma_0^a} \frac{\hat{u}(n_3, \tau_3) \hat{u}(n_4, \tau_4) \langle n_2 \rangle^{1-\alpha}}{\sigma_2^a} \frac{c(n_2, \tau_2)}{\sigma_1^a}.
\] (52)

Bourgain then divided the argument into several cases, depending on the sizes of \( \sigma_0, \ldots, \sigma_4. \) Here, the key algebraic relation is
\[
n^3 - n_2^3 - n_3^3 - n_4^3 = 3(n_2 + n_3)(n_3 + n_4)(n_4 + n_2) \quad \text{with} \quad n = n_2 + n_3 + n_4. \] (53)

Then, Bourgain proved \( [\text{Bourgain 1997}, (2.69)] \)
\[
I_{-\alpha,1-\alpha} \lesssim o(1)\|u\|_{-(1-\alpha),a} I_{-\alpha,1-\alpha} + o(1)\|u\|^{5-\alpha}_{-(1-\alpha),a} + o(1)\|u\|_{-(1-\alpha),a},
\] (54)
assuming the a priori estimate (8): \( |\hat{u}(n, t)| < C \) for all \( n \in \mathbb{Z}, \) \( t \in \mathbb{R}. \) Indeed, the estimates involving the first two terms on the right-hand side of (54) were obtained without (8), and only the last term in (54) required (8) \( [\text{Bourgain 1997, “Estimation of (2.62)”}], \) which was then used to deduce
\[
\|\hat{u}(n, \cdot)\|_{L^2_t} < C.
\] (55)
The a priori estimate (8) is derived via the isospectral property of the KdV flow and is false for a general function in $X^{-(1-a), a}$. (It is here that the smallness of the total variation $\|u\|$ is used.)

Our goal is to carry out a similar analysis for SKdV (2) on the second iteration without the a priori estimates (8) and (55) coming from the complete integrability of KdV. We achieve this goal by considering the estimate in

$$X_{a,0}^{a,0} = X_{a,0}^{-\frac{1}{2} + \delta, \frac{1}{2} - \delta},$$

where $p = 2 + \frac{p - 2}{4p} < \delta < \frac{p - 2}{2p}$. By (15) and (17) (recall $\alpha = -\frac{1}{2} + \delta$ and $-(1 - \alpha) = -\frac{1}{2} - \delta$), we have

$$\|u\|_{X_{a,0}^{a,0}} \leq \|u\|_{X^{a,0}} \quad \text{and} \quad \|u\|_{X^{-(1-a), a}} \lesssim \|u\|_{X^{a,0}}.$$  \hspace{1cm} (56)

Then, it follows from (46) and (56) that

$$\|N_0(u, u)\|_{X_{a,0}^{a,0}} \leq o(1)\|u\|_{X_{a,0}^{a,0}}^2.$$  \hspace{1cm} (57)

Now, we consider the estimate on $\|N_1(u, u)\|_{X_{a,0}^{a,0}}$. From (56) and $\alpha < 1 - a$, it suffices to control $L_{-a, 1-a}$. As in the deterministic case, we consider the second iteration, and substitute (4) for $\hat{u}(n_1, \tau_1)$ in (48). As before, there is no contribution from $S(t)u_0$, or $M_1(u, u)$, $M_3(u, u)$ defined in (51). There are two contributions:

(i) $N_1(M_2(u, u), u)$ from the deterministic nonlinear part: In this case, we can use the estimates from [Bourgain 1997] except when the a priori bound (8) was assumed; that is, we need to estimate the contribution from [Bourgain 1997, (2.62)]:

$$R_\alpha := \sum_n \int \chi_B \frac{d(n, \tau)}{\langle n \rangle^{1+a} \sigma_n^0} \hat{u}(-n, \tau_2)\hat{u}(n, \tau_3)\hat{u}(n, \tau_4)d\tau_2d\tau_3d\tau_4,$$  \hspace{1cm} (58)

where $\|d(n, \tau)\|_{L_2^\alpha}$, $B = \{\sigma_0, \sigma_2, \sigma_3, \sigma_4 < |n|\}$ with some small parameter $\gamma > 0$. Note that this corresponds to the case $n_2 = -n$ and $n_3 = n_4 = n$ in (52) after some reduction. In our analysis, we directly estimate $R_\alpha$ in terms of $\|u\|_{X_{a,0}^{a,0}}$. The key observation is that we can take the spatial regularity $s = -a$ to be greater than $-\frac{1}{2}$ by choosing $p > 2$.

(ii) $N_1(\Phi, u)$ from the stochastic convolution $\Phi$ in (10): In view of (56), we estimate

$$\mathbb{E}\left[\|N_1(\eta \Phi, u)\|_{X_{-a,1-a}}\right]$$  \hspace{1cm} (59)

via the stochastic analysis from Section 4.

**Remark 5.1.** In fact, we do not need to take an expectation in (59) since we establish local well-posedness pathwise in $\omega$, that is, for almost every fixed $\omega$. Nonetheless, we estimate (59) with the expectation since it shows how $F_1^N$ and $F_2^N$ defined in (70) arise along with their estimates.

**Estimate on (i).** In [Bourgain 1997], the parameter $\gamma = \gamma(\alpha)$, subject to the conditions (2.43) and (2.60) therein, played a certain role in estimating $R_\alpha$ along with the a priori bound (8). However, it plays no role in our analysis. By the Cauchy–Schwarz and Young’s inequalities, we have

$$(58) \leq \sum_n \|d(n, \cdot)\|_{L^2_\gamma}^{-1-a} \|\hat{u}(-n, \tau_2)\|_{L^6_{\tau_2}} \|\hat{u}(n, \tau_3)\|_{L^6_{\tau_3}} \|\hat{u}(n, \tau_4)\|_{L^6_{\tau_4}}.$$
By the Hölder inequality (with appropriate ± signs) and the fact that \(-1 - \alpha < -3\alpha\),

\[
(58) \leq \sum_n \|d(n, \cdot)\|_{L^2_\alpha}^4 \prod_{j=2}^4 \langle n \rangle^{-\alpha} \|\sigma_j^{-\alpha}\|_{L^2_\alpha} \|\sigma_j^\alpha \hat{u}(\pm n, \tau_j)\|_{L^2_\alpha} \leq \|d(\cdot, \cdot)\|_{L^2_{\alpha, r}} \|u\|_{X^{\alpha, a}_{6,2}}^3 \leq \|u\|_{X^{\alpha, a}_{p,2}},
\]

where the last two inequalities follow by choosing \(\alpha > \frac{1}{3}\) and \(p = 2+ < 6\).

**Estimate on (ii).** We use the notation from the proof of Proposition 4.1. It follows from (28) and \(\eta(t) \Phi(\cdot, t) = S(t)g(\cdot, t)\) that

\[
(\eta \Phi)^\wedge(n_1, \tau_1) = \hat{g}(n_1, \tau_1 - n_1^3) = \frac{1}{\sqrt{2}} I_{n_1}^{(1)}(\tau_1 - n_1^3) + \frac{1}{\sqrt{2}} I_{n_1}^{(2)}(\tau_1 - n_1^3).
\]

Recall that \(\sigma_1 = (\tau_1 - n_1^3) \gtrsim \langle nn_1n_2 \rangle\). Also, recall from the proof of Proposition 4.1 that \(|\phi_{n_1}(r)| = \chi_{[0, \tau]}(r)\) is independent of \(\omega\).

- Contribution from \(I_{n_1}^{(1)}(\tau_1 - n_1^3)\): From (48) with (27), (28), and (29), we estimate (59) by

\[
(59) \lesssim \mathbb{E} \left[ \sum_{n = n_1 + n_2} \int_0^T d\tau d\tau_1 \frac{(n_1)^{1-\alpha} d(n_1, \tau)}{\sigma_1^a} \frac{1}{\sigma_2^a} \int_0^T \|\phi_{n_1}(r)\|_{L^2([0,T])} \|c(n_2, \tau_2)\|_{L^2(\Omega)} \right].
\]

By the Cauchy–Schwarz inequality in \(\omega\) and the Ito isometry,

\[
(59) \lesssim \sum_{n = n_1 + n_2} \int_0^T d\tau d\tau_1 \frac{d(n_1, \tau)}{\sigma_1^a} \|\phi_{n_1}\|_{L^2([0,T])} \|c(n_2, \tau_2)\|_{L^2(\Omega)} \leq \mathbb{E} \left[ \int_0^T \|\phi\|_{L^p([0,T]; L^2(\Omega))}^2 \right] \|u\|_{L^2(\Omega; X^{\alpha, a})} \leq \mathbb{E} \left[ \int_0^T \|\phi\|_{L^p([0,T]; L^2(\Omega))}^2 \right] \|u\|_{L^2(\Omega; X^{\alpha, a})}.
\]

By the \(L^4_{x,t}, L^2_{x,t}, L^4_{x,t}\)-Hölder inequality along with Lemma 3.3, (16), (18), (49), and (56), this leads to

\[
(59) \lesssim T^\theta \|d\|_{L^2_{x,t}} \|\phi\|_{L^2([0,T]; H^{-\frac{1}{2} - \frac{3}{2} (\alpha/2)^{1/2} + \alpha})} \|c\|_{L^2(\Omega; L^2_{x,t})} \leq T^\theta \|\phi\|_{L^p([0,T]; L^2(\Omega; x^{-\alpha}))} \|u\|_{L^2(\Omega; X^{\alpha, a})} \]

\[
\lesssim T^\theta \|\phi\|_{L^p([0,T]; L^2(\Omega; x^{-\alpha}))} \|u\|_{L^2(\Omega; X^{\alpha, a})}.
\]

**Remark 5.2.** Strictly speaking, we need to take the supremum over \(\|d\|_{L^2_{a,r}} = 1\) inside the expectation in (60). However, we do not worry about this issue to simplify the presentation, since we have

\[
(59) \leq \|N_1(\eta \Phi, u)\|_{L^2(\Omega; X^{-\alpha,1-\alpha})}
\]

\[
\leq \left( \sum_n \int_0^T \frac{(n)^{2-2\alpha}}{\sigma_0^a} \mathbb{E} \left[ \int_0^T \|\phi_{n_1}(r)\|_{L^2([0,T])} \|c(n_2, \tau_2)\|_{L^2(\Omega)} d\tau_1 \right] d\tau \right)^{1/2}
\]

\[
= \sup_{\|d\|_{L^2_{a,r}} = 1} (61)
\]

by the Ito isometry. Also, recall that we have \(I_{n_1}^{(1)}(\tau_1 - n_1^3) = \int_0^T G_{n_1}^{(1)}(r, \tau_1 - n_1^3) d\beta_{n_1}(r)\) where \(G_{n_1}^{(1)}(r, \tau)\) is defined in (27). Hence, strictly speaking, we should replace \(G_{n_1}^{(1)}(r, \tau_1 - n_1^3)\) by \(\sigma_1^{-\alpha}\|\phi_{n_1}(r)\|\) in (60) only after the application of the Ito isometry. Once again, we do not worry about this issue to simplify the presentation. The same remark applies to the following as well.
• Contribution from $I_{x_1}^{(2)}(t_1 - n_1^3)$: Suppose $\max(\sigma_0, \sigma_2) \gtrsim (nn_1n_2)^{1/100}$; say $\sigma_0 \geq (nn_1n_2)^{1/100}$. Then

$$
\int_0^T d\tau \int_{\Omega} \frac{1}{\sigma_0} \phi_{n_1}(r) d\beta_{n_1}(r) \frac{(n_2)^{1-a} c(n_2, \tau_2)}{\sigma_2^a}
$$

Then we can conclude this case as before by the $L^4_{x,t}, \dot{L}^2_{x,t}, \dot{L}^4_{x,t}$-Hölder inequality as long as $\alpha - 200\delta > \frac{1}{3}$, which can be guaranteed by taking $\delta > 0$ sufficiently small, or equivalently, taking $p > 2$ sufficiently close to 2.

Now assume instead $\max(\sigma_0, \sigma_2) \ll (nn_1n_2)^{1/100}$. We invoke a result contained in [Colliander et al. 2003, (7.50) and Lemma 7.4]. The conclusion there is stated with $-1$ as the exponent of $\langle \tau - n^3 \rangle$, instead of $-\frac{3}{4}$; but by examining the proof, one sees that it will work with any exponent more negative than $-\left(\frac{3}{4} + \frac{1}{100}\right)$.

**Lemma 5.3.** For $\Omega(n) = \{\eta \in \mathbb{R} : \eta = -3nn_1n_2 + o((nn_1n_2)^{1/100})$ for some $n_1 \in \mathbb{Z}$ with $n = n_1 + n_2\},$

$$
\int_0^1 \tau - n^3 \chi_{\Omega(n)}(\tau - n^3) d\tau \lesssim 1.
$$

We have

$$
\int_0^T d\tau \int_{\Omega} \frac{1}{\sigma_0} \phi_{n_1}(r) d\beta_{n_1}(r) \frac{(n_2)^{1-a} c(n_2, \tau_2)}{\sigma_2^a}
$$

By the Cauchy–Schwarz inequality and the Ito isometry, this yields

By the $L^4_{x,t}, \dot{L}^2_{x,t}, \dot{L}^4_{x,t}$-Hölder inequality along with Lemma 3.3, Lemma 5.3, and Equations (16), (18), (49), and (56), we get

$$
T^\theta \|d\|_{L^2_{0,T}} \langle n_1 \rangle^{-\frac{1}{2} - \delta} \|\phi_{n_1}\|_{L^2_{[0,T],\chi_{\Omega(n)}}} \|\phi\|_{L^2_{\dot{X}^{-\alpha'},\infty}} \lesssim T^\theta \|\phi\|_{L^p((0,T),\dot{b}_{p,\infty}^{-\alpha,\infty})}\|u\|_{L^2(\mathbb{R},X^{-\alpha,a})}.
$$

**Proof of Theorem 1.** Fix a mean-zero $u_0 \in \dot{b}_{p,\infty}^{-\alpha'}(\mathbb{T})$ and $\phi$ as in (3), where $\alpha' = \frac{1}{2} - \delta - \frac{p - 2}{4p} < \delta < \frac{p - 2}{2p}$ such that $(-\alpha')p < -1$. Consider sequences of initial data $u_0^N \in L^2(\mathbb{T})$ and diagonal covariance operator $\phi^N \in HS(L^2, L^2)$, given by

$$
u_0^N = \sum_{|n| \leq N} \hat{u}_0(n)e^{inx} \quad \text{and} \quad \phi^N(t, \omega) = \text{diag} (\phi_n(t, \omega); 0 < |n| \leq N),
$$

where $\phi_n$ is given in (3). Now, fix $\alpha = \frac{1}{2} - \delta > \alpha'$ as in (47). Note that such $u_0^N$ converges to $u_0$ in $\mathbb{F}L^{-\alpha,p}(\mathbb{T})$, and thus in $\hat{b}_{p,\infty}^{-\alpha}(\mathbb{T})$. Also, $\phi^N$ converges to $\phi$ in $\mathbb{F}L^{-\frac{1}{2},p}(\mathbb{T})$ for each $t$ and $\omega$, and thus
in $\hat{b}_{p, \infty}^{-1}(\mathbb{T})$. Then, by the monotone convergence theorem, $\phi^N$ converges to $\phi$ in $L^p([0, 1] \times \Omega; \hat{b}_{p, \infty}^{-1})$. (Indeed, the convergence is in $L^\infty([0, 1] \times \Omega; \hat{b}_{p, \infty}^{1-1})$, since we have $|\phi_n(t, \omega)| = 1$ for all $n$, independent of $t \in \mathbb{R}$ and $\omega \in \Omega$.) Note that a slight loss of the regularity $-\alpha < -\alpha'$ was necessary since $u_0^N$ defined in (65) does not necessarily converge to $u_0$ in $\hat{b}_{p, \infty}^{-\alpha}(\mathbb{T})$ due to the $L^\infty$ nature of the norm over the dyadic blocks. We can avoid such a loss of the regularity if we start with $u_0 \in \mathcal{F}L^{3, p}(\mathbb{T})$.

Now, let $\Gamma = \Gamma_{u_0}^N$ be the map defined by

$$
\Gamma^N \nu = \Gamma_{u_0}^N \nu := S(t)u_0^N - \frac{1}{2}N\nu \phi^N + \eta \Phi^N,
$$

where $\Phi^N$ is the stochastic convolution defined in (10) with the covariance operator $\phi^N$. By the well-posedness result in [De Bouard et al. 2004], there exists a unique global solution $u^N \in L^\infty(\mathbb{R}^+; L^2(\mathbb{T})) \cap C(\mathbb{R}^+; B^0_{2,1}(\mathbb{T}))$ a.s. to (66) for each $N$ since $\phi^N \in H(S(L^2; L^2))$.

Now, we put all the estimates together. Note that all the implicit constants are independent of $N$. Also, when there is no superscript $N$, it means that $N = \infty$. From Lemma 3.1, we have

$$
\|S(t)u_0^N\|_{X_{p, 2}^{s, b, T}} \leq C_1 \|u_0^N\|_{\hat{b}_{p, \infty}},
$$

for any $s, b \in \mathbb{R}$ with $C_1 = C_1(b)$. In particular, by taking $b > \frac{1}{2}$, we see that $S(t)u_0$ is continuous on $[0, T]$ with values in $\hat{b}_{p, \infty}$. Also, by taking $b < \frac{1}{2}$, we gain a power of $T$. From the definition of $N_j(\cdot, \cdot)$ and (65), we have

$$
\|N(u^N, u^N)\|_{X_{p, 2}^{-\alpha, a, T}} \leq C_2 T^{\theta_1} \|u^N\|_{X_{p, 2}^{-\alpha, a, T}}^2 + 2 \|N(u^N, u^N)\|_{X_{p, 2}^{-\alpha, a, T}}.
$$

Also, from (47) and (56), we have

$$
\|N_1(u^N, u^N)\|_{X_{p, 2}^{-\alpha, 1-a, T}} \leq I_{-\alpha, 1-a}^N.
$$

Recall that $\eta \Phi \in X_{p, 2}^{-\alpha, a}$ a.s. from Proposition 4.1. Moreover, by defining $F_1^N$ and $F_2^N$ on $\mathbb{T} \times \mathbb{R} \times \Omega$ via their Fourier transforms

$$
\begin{align*}
\hat{F}_1^N(n, \tau) &= (n)^{-\frac{1}{2}-\delta} (\sigma_0^{-\frac{3}{2}+\delta} + \sigma_0^{-\frac{1}{2}-\delta}) \int_0^T \phi_n(r) d\beta_n(r), \\
\hat{F}_2^N(n, \tau) &= (n)^{-\frac{1}{2}-\delta} \chi_{\Omega(n)}(\tau - n^3) \sigma_0^{-\frac{3}{2}+\delta} \int_0^T \phi_n(r) d\beta_n(r),
\end{align*}
$$

for $|n| \leq N$, we have $F_1^N, F_2^N \in L^2(\mathbb{R}; L^2_{x,t})$ by the Ito isometry and Lemma 5.3, which is basically shown in the estimate on (ii). See (61) and (64). Then, from (54) and the estimates on (i) and (ii), we have

$$
I_{-\alpha, 1-a}^N \leq C_3 (T^{\theta_2} \|u^N\|_{X_{p, 2}^{-\alpha, a, T}} I_{-\alpha, 1-a}^N + T^{\theta_3} \|u^N\|_{X_{p, 2}^{-\alpha, a, T}}^2 + T^{\theta_4} L_\omega^N \|u^N\|_{X_{p, 2}^{-\alpha, a, T}}),
$$

where $L_\omega^N = L^N(F_1^N, F_2^N)(\omega) := \|F_1^N(\omega)\|_{L^2_{x,t}} + \|F_2^N(\omega)\|_{L^2_{x,t}} < \infty$ a.s. Moreover, $L_\omega^N$ is nondecreasing in $N$. 

For fixed \(R > 0\), choose \(T > 0\) small such that \(C_3 T^\theta_2 R \leq \frac{1}{2}\). Then, from (71), we have

\[
I_{-a,1-a}^N \leq 2C_3 \left( T^{\theta_3} \| u^N \|_{X_{p,2}^{-a,a,T}}^3 + T^{\theta_4} L_{\omega}^N \| u^N \|_{X_{p,2}^{-a,a,T}} \right)
\]

(72) for \(\| u^N \|_{X_{p,2}^{-a,a,T}} \leq R\). From (66)–(72), we have

\[
\| u^N \|_{X_{p,2}^{-a,a,T}} = \| \Gamma^N u^N \|_{X_{p,2}^{-a,a,T}} \leq C_1 \| u_0^N \|_{\tilde{B}^{a,a}_{p,\infty}} + \frac{1}{2} C_2 T^{\theta_1} \| u^N \|_{X_{p,2}^{-a,a,T}}^2 + 2C_3 \left( T^{\theta_3} \| u^N \|_{X_{p,2}^{-a,a,T}}^2 + T^{\theta_4} L_{\omega}^N \| u^N \|_{X_{p,2}^{-a,a,T}} \right) + C_4 \| \eta \Phi^N(\omega) \|_{X_{p,2}^{-a,a}}
\]

(73) and

\[
\| u^N - u^M \|_{X_{p,2}^{-a,a,T}} = \| \Gamma^N u^N - \Gamma^M u^M \|_{X_{p,2}^{-a,a,T}} \leq C_1 \| u_0^N - u_0^M \|_{\tilde{B}^{a,a}_{p,\infty}} + \frac{1}{2} C_2 T^{\theta_1} \left( \| u^N \|_{X_{p,2}^{-a,a,T}} + \| u^M \|_{X_{p,2}^{-a,a,T}} \right) \| u^N - u^M \|_{X_{p,2}^{-a,a,T}}
\]

\[+ C_3 T^{\theta_3} \left( \| u^N \|_{X_{p,2}^{-a,a,T}} + \| u^M \|_{X_{p,2}^{-a,a,T}} \right) \| u^N - u^M \|_{X_{p,2}^{-a,a,T}}
\]

\[+ 2C_4 \left( T^{\theta_4} L_{\omega}^N \| u^N \|_{X_{p,2}^{-a,a,T}} + T^{\theta_4} L_{\omega}^M \| u^M \|_{X_{p,2}^{-a,a,T}} \right) + C_4 \| \eta \Phi^N(\omega) \|_{X_{p,2}^{-a,a}}
\]

(74)

where

\[
\tilde{L}_{\omega}^{N,M} := \| F_1^N - F_1^M \|_{L^2_{\omega,t}} + \| F_2^N - F_2^M \|_{L^2_{\omega,t}}.
\]

Note that in estimating the difference \(\Gamma^N u^N - \Gamma^M u^M\) on \(A_1\), one needs to consider

\[
\tilde{T}_{-a,1-a} := \| N_1(u^N, u^N) - N_1(u^M, u^M) \|_{-a,1-a}
\]

(76)
as in [Bourgain 1997]. We can follow the argument on pages 135–136 in that reference, except for \(R_a\) defined in (58), which yields the third term on the right-hand side of (74). As for \(R_a\), we can write

\[
N(N(u, u), u) - N(N(v, v), v) = N(N(u + v, u - v), u) + N(N(v, v), u - v)
\]

(77)
as in [Bourgain 1997, (3.4)], and then we can repeat the computation done for \(R_a\) in the estimate on (i), also yielding the third term on the right-hand side of (74).

By the definition of \(u_0^N\), we have

\[
2C_1 \| u_0^N \|_{\tilde{B}^{a,a}_{p,\infty}} \leq 2C_1 \| u_0 \|_{\tilde{B}^{a,a}_{p,\infty}} + \frac{1}{2} \text{ for } N \text{ sufficiently large.}
\]

And since \(\Phi^N\) converges to \(\Phi\) in \(L^p([0,1] \times \Omega; \tilde{B}^{a,a}_{p,\infty})\), it follows from Corollary 4.2 and the estimate on (ii), see (61), (62), and (64), that \(E[\| \eta(\Phi^N - \Phi)\|_{X_{p,2}^{-a,a}}] \) and \(E[\tilde{L}_{\omega}^{N,\infty}]\) defined in (75) converge to 0. Hence, \(\| \eta(\Phi^N - \Phi)\|_{X_{p,2}^{-a,a}} + \tilde{L}_{\omega}^{N,\infty} \to 0\) a.s. after selecting a subsequence (which we still denote with the index \(N\)). Then, by Egoroff’s theorem, given \(\varepsilon > 0\), there exists a set \(\Omega_{\varepsilon}\) with \(\mathbb{P}(\Omega_{\varepsilon}) < 2^{-1} \varepsilon\) such that \(\| \eta(\Phi^N - \Phi)\|_{X_{p,2}^{-a,a}} + \tilde{L}_{\omega}^{N,\infty} \to 0\) uniformly in \(\Omega_{\varepsilon}\). In particular, \(2C_4 \| \eta \Phi^N \|_{X_{p,2}^{-a,a}} \leq 2C_4 \| \eta \Phi \|_{X_{p,2}^{-a,a}} + \frac{1}{2}\)

for large \(N\) uniformly on \(\Omega_{\varepsilon}\). In the following, we will work on \(\Omega_{\varepsilon}\).

Now, let \(R_{\omega} = 2(C_1 \| u_0 \|_{\tilde{B}^{a,a}_{p,\infty}} + C_4 \| \eta \Phi(\omega) \|_{X_{p,2}^{-a,a}}) + 1\), and define the stopping time \(T_{\omega}\) by

\[
T_{\omega} = \inf \left\{ T > 0 : \max(C_3 T^\theta_2 R_{\omega}, P_1(T, R_{\omega}, \omega), P_2(T, R_{\omega}, \omega)) \geq \frac{1}{2} \right\}
\]

(78)

where

\[
P_1(T, R_{\omega}, \omega) = \frac{1}{2} C_2 T^{\theta_1} R_{\omega} + 2C_3 T^{\theta_1} (R_{\omega})^2 + 2C_3 T^{\theta_4} L_{\omega}
\]

from (73),

\[
P_2(T, R_{\omega}, \omega) = C_2 T^{\theta_1} R_{\omega} + 2C_5 T^{\theta_1} (R_{\omega})^2 + 2C_3 T^{\theta_4} L_{\omega}
\]

from (74).
The first condition in the definition of $T_\omega$ guarantees (72), and hence (73) and (74), for $\|u^N\|_{X_{p,2}^{-a,a,T}} \leq R_\omega$. The second condition along with (73) indeed guarantees that

$$\|u^N\|_{X_{p,2}^{-a,a,T}} \leq R_\omega$$  \(\text{(79)}\)

for $T \leq T_\omega$, for the following reason. Because of the temporal regularity $b = \alpha < \frac{1}{2}$, we have $\|u^N\|_{X_{p,2}^{-a,a,T}} = \|\chi_{[0,T]}u^N\|_{X_{p,2}^{-a,a,\cdot}}$, where $\chi_{[0,T]}$ denotes the characteristic function of the time interval $[0, T]$ [Bourgain 1999]. Hence, $\|u^N\|_{X_{p,2}^{-a,a,T}}$ is continuous in $T$ since

$$\left|\|u^N\|_{X_{p,2}^{-a,a,T+\delta}} - \|u^N\|_{X_{p,2}^{-a,a,T}}\right| \leq \|u^N\|_{X_{p,2}^{-a,a,T+\delta}} \leq \delta^0 \|u^N\|_{X_{p,2}^{-a,a,T+\delta}}$$  \(\text{(80)}\)

for sufficiently small $\delta > 0$. Note that the last term in (80) is finite for small $\delta$ since the local-in-time solutions constructed in [De Bouard et al. 2004] are controlled in this norm (indeed in a stronger norm adapted to the Besov space $B^0_{2,1}$). Then, (79) follows from (73), the second condition in (78), and the continuity of the norm in $T$ since (79) clearly holds at $T = 0$.

From (74) along with the third condition in (78), we have

$$\|u^N - u^M\|_{X_{p,2}^{-a,a,T_\omega}} \leq 2C_1\|u^N_0 - u^M_0\|_{\hat{b}_{p,\infty}} + 4C_3T_\omega^0 R_\omega \tilde{L}^{N,M}_\omega + 2C_4\|\eta (\Phi^N - \Phi^M)\|_{X_{p,2}^{-a,a}}.$$  \(\text{(81)}\)

The right-hand side of (81) goes to 0 as $N, M \to \infty$ since $u^N_0$ is Cauchy in $\hat{b}_{p,\infty}$ and

$$\|\eta (\Phi^N - \Phi^M)\|_{X_{p,2}^{-a,a}} + \tilde{L}^{N,M}_\omega \to 0$$

on $\Omega_\epsilon$ uniformly in $N, M$. Let $u$ denote the limit in $X_{p,2}^{-a,a,T_\omega}$. In the following, we give a brief discussion to show that the limit $u$ is a solution to (4). Clearly, $S(t)u^N_0$ and $\eta \Phi^N$ converge to $S(t)u_0$ and $\eta \Phi$ in $X_{p,2}^{-a,a,T_\omega}$. It follows from (57) that $\mathcal{N}_0(u^N, u^N)$ converges to $\mathcal{N}_0(u, u)$ in $X_{p,2}^{-a,a,T_\omega}$. In view of (72), (74), and (76), we see that $\mathcal{N}_j(u^N, u^N)$ is Cauchy in a slightly stronger space $X_{p,2}^{-a,1-a,T_\omega}$, $j = 1, 2$. Let $v_j$ denote the corresponding limit. Thus, from (66), we have

$$u = S(t)u_0 - \frac{1}{2} \mathcal{N}_0(u, u) - \frac{1}{2}(v_1 + v_2) + \eta \Phi.$$  \(\text{(82)}\)

Now, we need to show that $\mathcal{N}_j(u^N, u^N)$ indeed converges to $\mathcal{N}_j(u, u)$, $j = 1, 2$. By symmetry, we only consider $\mathcal{N}_1(u, u) - \mathcal{N}_1(u^N, u^N)$. As before, we substitute (82) and (66) in the first factor $u$ (and $u^N$) of $\mathcal{N}_1(\cdot, \cdot)$, respectively. There are three contributions to consider.

(A) Contribution from the stochastic terms: We have

$$\mathcal{N}_1(\eta \Phi, u) - \mathcal{N}_1(\eta \Phi^N, u^N) = \mathcal{N}_1(\eta (\Phi - \Phi^N), u) + \mathcal{N}_1(\eta \Phi^N, u - u^N).$$  \(\text{(83)}\)

From the estimate on (ii), we have

$$\| (83) \|_{X_{p,2}^{-a,a,T_\omega}} \lesssim \tilde{L}^{N,\infty}_\omega \|u\|_{X_{p,2}^{-a,a,T_\omega}} + L^{N}_\omega \|u^N - u\|_{X_{p,2}^{-a,a,T_\omega}} \to 0$$

as $N \to \infty$, since $\|u\|_{X_{p,2}^{-a,a,T}} \leq R_\omega$ and $\tilde{L}^{N,\infty}_\omega \to 0$ uniformly on $\Omega_\epsilon$.

(B) Contribution from $\mathcal{N}_0(\cdot, \cdot)$: In this case, we consider

$$\mathcal{N}_1(\mathcal{N}_0(u, u), u) - \mathcal{N}_1(\mathcal{N}_0(u^N, u^N), u^N).$$  \(\text{(84)}\)

The right-hand side of (84) goes to 0 as $N, M \to \infty$ since $\mathcal{N}_0(u^N, u^N)$ is Cauchy in $\hat{b}_{p,\infty}$ and

$$\|\mathcal{N}_0(u, u)\|_{X_{p,2}^{-a,a}} + \tilde{L}^{N}_\omega \to 0$$

on $\Omega_\epsilon$ uniformly in $N, M$. Let $u$ denote the limit in $X_{p,2}^{-a,a,T_\omega}$.
Note that we have $\sigma_1 \geq \sigma_0, \sigma_2, \sigma_3, \sigma_4$ from the definition of $\mathcal{N}_1(\cdot, \cdot)$ and $\mathcal{N}_0(\cdot, \cdot)$, see (50) and (52). Indeed, we have $\sigma_1 \geq \sigma_0, \sigma_2$ since we are on $A_1$ defined in (45), and also $\sigma_1 \geq \sigma_3, \sigma_4$ since we are on the support of $\mathcal{N}_0(\cdot, \cdot)$ in the first factor of $\mathcal{N}_1(\cdot, \cdot)$. Once again, one can easily follow the argument in [Bourgain 1997, page 136] and show

$$
\| (84) \|_{X^{-a,a,T_0}} \lesssim \left( \| u^N \|_{X^{-a,a,T_0}}^2 + \| u \|_{X^{-a,a,T_0}}^2 \right) \| u^N - u \|_{X^{-a,a,T_0}} \to 0.
$$

In treating $R_\alpha - R^N_\alpha$ defined in (58), one needs to proceed as before, using (77) and the estimate on (i).

(C) Contribution from $v_j$ and $\mathcal{N}_j(u^N, u^N)$, $j = 1$ or 2: By symmetry, assume $j = 1$. In this case, we have $\sigma_1 \geq \sigma_0, \sigma_2$ but $\sigma_3 \geq \sigma_1, \sigma_4$, thus we control (54) by the first term on the right-hand side [Bourgain 1997, (II.1) on page 126]. Now, we need to estimate

$$
\mathcal{N}_1(v_1, u) - \mathcal{N}_1(N_1(u^N, u^N), u^N) = \mathcal{N}_1(v_1 - \mathcal{N}_1(u^N, u^N), u) + \mathcal{N}_1(N_1(u^N, u^N), u - u^N) =: I + II. \quad (85)
$$

Then, by proceeding as in [Bourgain 1997] with (56) and (72), we have

$$
\| \mathcal{I} \|_{X^{-a,1-\alpha,T_0}} \lesssim I_{N,1-a,1-a}^N \| u - u^N \|_{X^{-1-\alpha,a,T_0}} \lesssim \| u - u^N \|_{X^{-a,a,T_0}} \to 0.
$$

By proceeding as in [Bourgain 1997, (II.1)] with $|n_1|^\alpha$ replaced by $|n_1|^{1-\alpha}$, followed by (56), we have

$$
\| \mathcal{I} \|_{X^{-a,1-\alpha,T_0}} \lesssim \| v_1 - \mathcal{N}_1(u^N, u^N) \|_{X^{-1-a,1-a,1},u} \lesssim \| v_1 - \mathcal{N}_1(u^N, u^N) \|_{X^{-a,1-\alpha,T_0}} \| u \|_{X^{-a,a,T_0}} \to 0,
$$

since $v_1 = \lim_{N \to \infty} \mathcal{N}_1(u^N, u^N)$ in $X^{-a,1-\alpha,T_0}$ by definition.

Hence, we have $u = \Gamma \omega u$ for each $\omega \in \Omega_\varepsilon$, so $u$ is a mild solution to (2) on $[0, T_\omega]$. Let $\Omega^{(1)} = \Omega_\varepsilon$.

Now, we can recursively construct

$$
\Omega^{(j+1)} \subset \Omega \setminus \bigcup_{k=1}^{j} \Omega^{(k)}
$$

for $j = 1, 2, \ldots$ with $\mathbb{P}(\Omega \setminus \bigcup_{k=1}^{j} \Omega^{(k)}) < 2^{-j} \varepsilon$ such that $\| \eta(\Phi_N - \Phi) \|_{X^{-a,0}}$ and $\hat{\mathcal{L}}_{j+1}^{N,\omega}$ converge to 0 uniformly in each $\Omega^{(j)}$. Then, by repeating the argument, we can construct a solution $u$ on $\bigcup_{j=1}^{\infty} \Omega^{(j)}$.

Note that $\mathbb{P}(\Omega \setminus \bigcup_{j=1}^{\infty} \Omega^{(j)}) = 0$.

We have constructed a solution $u$ to (2) in $X^{-a,a,T_0}$ with $u_0 \in \hat{b}_{p,\infty}$. Since $u$ is a solution, the a priori estimate (73) holds with the regularity $(s, b) = (-a', a')$ in place of $(-a, a)$. Then, we easily see that $u \in X^{-a',a',T_0}$ by redefining $R_\alpha$ and $T_\omega$ with this regularity. In the remaining of the paper, we work only with the spatial regularity $s = -a'$, that is, there is no approximating sequences any more. Hence, for notational simplicity, we will use $-a$ in place of $-a'$ to denote the spatial regularity of the solution in the following.

We still need to take care of several issues. Note that the temporal regularity $b = a = \frac{1}{2} - \delta$ of the solution $u$ is less than $\frac{1}{2}$. In particular, we need to show that the solution $u$ is continuous from $[0, T_\omega]$ into $\hat{b}_{p,\infty}^{-a}$. We also need to show its uniqueness and continuous dependence on the initial data.
From Proposition 4.5, \( \eta \Phi \in C([0, T_\omega]; \hat{b}_{p, \infty}^{-a}) \) a.s. Also, it follows from (67) with \( b = \frac{1}{2} + \delta \), (69), (72), and symmetry on \( \sigma_1 \) and \( \sigma_2 \), that
\[
S(t)u_0 + \mathcal{N}_1(u, u) + \mathcal{N}_2(u, u) \in X_{p, 2}^{-a, \frac{1}{2} + \delta, T_\omega} \subset C([0, T_\omega]; \hat{b}_{p, \infty}^{-a})
\]
almost surely. Now, we consider \( \mathcal{N}_0(u, u) \), that is, when \( \sigma_0 = \text{MAX} \). Note that the contribution comes only from \( M_2(u, u) \) defined in (51). Define
\[
\mathcal{N}_3(u, u) = \text{the contribution of } \mathcal{N}_0(u, u) \text{ on } \{ \max(\sigma_1, \sigma_2) \geq \langle n n_1 n_2 \rangle^{1/100} \},
\]
\[
\mathcal{N}_4(u, u) = \mathcal{N}_0(u, u) - \mathcal{N}_3(u, u).
\]
(a) First, we consider \( \mathcal{N}_3(u, u) \), so \( \max(\sigma_1, \sigma_2) \geq \langle n n_1 n_2 \rangle^{1/100} \), say \( \sigma_1 \geq \langle n n_1 n_2 \rangle^{1/100} \). Then, by (15) and Lemma 3.2, we have
\[
\| \mathcal{N}_3(u, u) \|_{X_{p, 2}^{-a, \frac{1}{2} + \delta, T_\omega}} \lesssim \| \hat{\partial}_x(u^2) \|_{X_{p, 2}^{-a, -\frac{1}{2} + \delta, T_\omega}} \lesssim \| \hat{\partial}_x(u^2) \|_{X_{p, 2}^{-a, -\frac{1}{2} + \delta, T_\omega}}.
\]
By duality and (44), the right-hand side equals
\[
\sup_{\| d \|_{L_{x,t}^4} = 1} \sum_{n, n_1} \int_{\sigma_0}^{\sigma_1} \frac{\langle n \rangle^{-a} d(n, \tau)}{\sigma_0^{1/2 + \delta}} \prod_{j=1}^2 \frac{\langle n_j \rangle^{-a} c(n_j, \tau_j)}{\sigma_j^a} d\tau d\tau_1 
\]
\[
\lesssim \sup_{\| d \|_{L_{x,t}^4} = 1} \sum_{n, n_1} \int_{\sigma_0}^{\sigma_1} d(n, \tau) \frac{c(n_1, \tau_1)}{\sigma_1^a} \frac{c(n_2, \tau_2)}{\sigma_2^a} d\tau d\tau_1,
\]
where \( c(n, \tau) \) is defined in (49). Thus, by the \( L^2_{x,t}, L^4_{x,t}, L^4_{x,t} \)-Hölder inequality along with Lemma 3.3, (49), and (56), we conclude that
\[
\| \mathcal{N}_3(u, u) \|_{X_{p, 2}^{-a, \frac{1}{2} + \delta, T_\omega}} \lesssim \| c \|_{L_{x,t}^4}^2 \| u \|_{X_{p, 2}^{-a, 1-a, \omega}}^2 \lesssim \| u \|_{X_{p, 2}^{-a, a}}^2 < \infty.
\]
(b) Now, consider \( \mathcal{N}_4(u, u) \), so \( \max(\sigma_1, \sigma_2) \ll \langle n n_1 n_2 \rangle^{1/100} \). It suffices to show that \( \mathcal{N}_0(u, u) \in X_{p, 1}^{-a, 0, T_\omega} \), since \( X_{p, 1}^{-a, 0, T_\omega} \subset C([0, T_\omega]; \hat{b}_{p, \infty}^{-a}) \). Then, by Cauchy–Schwarz inequality, Lemma 5.3 and duality, we have
\[
\| \mathcal{N}_4(u, u) \|_{X_{p, 1}^{-a, 0, T_\omega}} \leq \| \hat{\partial}_x(u^2) \|_{X_{p, 1}^{-a, 1, T_\omega}} \ll \| \langle n \rangle^{-a} \langle \tau - n^3 \rangle^{-1} \chi_{\Omega(n)}(\tau - n^3) \hat{\partial}_x(u^2) \|_{L_t^2} \| u \|_{L_t^2} \| \chi_{\Omega(n)}(\tau - n^3) \|_{L_t^2} \| \hat{\partial}_x(u^2) \|_{L_t^2} 
\]
\[
\ll \| \langle n \rangle^{-a} \langle \tau - n^3 \rangle^{-1/2 + \delta} \chi_{\Omega(n)}(\tau - n^3) \|_{L_t^2} \| \hat{\partial}_x(u^2) \|_{L_t^2} \| \langle n \rangle^{-a} \langle \tau - n^3 \rangle^{-1/2 + \delta} \chi_{\Omega(n)}(\tau - n^3) \|_{L_t^2} \| u \|_{L_t^2} \| \hat{\partial}_x(u^2) \|_{L_t^2} 
\]
\[
\lesssim \sup_{\| d \|_{L_{x,t}^4} = 1} \sum_{n, n_1} \int_{\sigma_0}^{\sigma_1} \frac{\langle n \rangle^{-a} d(n, \tau)}{\sigma_0^{1/2 + \delta}} \prod_{j=1}^2 \frac{\langle n_j \rangle^{-a} c(n_j, \tau_j)}{\sigma_j^a} d\tau d\tau_1 
\]
\[
\lesssim \sup_{\| d \|_{L_{x,t}^4} = 1} \sum_{n, n_1} \int_{\sigma_0}^{\sigma_1} d(n, \tau) \frac{c(n_1, \tau_1)}{\sigma_1^a} \frac{c(n_2, \tau_2)}{\sigma_2^a} d\tau d\tau_1.
\]
The rest follows as before. Hence, the solution \( u \) is continuous from \([0, T_\omega]\) to \( \hat{b}_{p, \infty}^{-a} \).
Lastly, we show the uniqueness and the continuous dependence of the solutions on the initial data. Let \( u \) and \( v \) be the mild solutions of (2) on \([0, T_\omega]\) with initial data \( u_0 \) and \( v_0 \); then

\[
\begin{align*}
u - \nu &= \Gamma u - \Gamma v = S(t)(u_0 - v_0) - \frac{1}{2} \left( N(u) - N(v) \right), \quad (86)
\end{align*}
\]

where \( \Gamma \) is defined in (66). Moreover, assume that

\[
\|u_0\|_{\mathfrak{H}_{p,\infty}} \leq R, \quad \|v_0\|_{\mathfrak{H}_{p,\infty}} \leq R, \quad \|u\|_{X_{p,2}^{-a,\omega,\tau_0}} \leq R, \quad \|v\|_{X_{p,2}^{-a,\omega,\tau_0}} \leq R. \quad (87)
\]

Let \( \tilde{N}_j(u, v) := -\frac{1}{2} (N_j(u) - N_j(v)) \) for \( j = 1, \ldots, 4 \). First, note that \( \|\tilde{N}_4(u, v)\|_{X_{p,1}^{-a,\omega,\tau_0}} \lesssim R^2 < \infty \) from (a slight variation of) Case (b), and we have

\[
\|\nu - \nu - \tilde{N}_4(u, v)\|_{X_{p,1}^{-a,\omega,\tau_0}} \lesssim S(t)(u_0 - v_0) + \sum_{j=1}^3 \tilde{N}_j(u, v) \lesssim C_1(R) < \infty
\]

by Cauchy–Schwarz inequality. Therefore, it follows from (88) and (89) that the solution map is Hölder continuous with the bound

\[
\|u - v\|_{C([0, T_\omega]; \mathfrak{H}_{p,\infty})} \lesssim \|u_0 - v_0\|_{\mathfrak{H}_{p,\infty}}. \quad (89)
\]

Hence, for sufficiently small \( T > 0 \), we have

\[
\|u - v\|_{X_{p,2}^{-a,\omega,\tau_0}} \lesssim \|u_0 - v_0\|_{\mathfrak{H}_{p,\infty}}. \quad (89)
\]

Therefore, it follows from (88) and (89) that the solution map is Hölder continuous with the bound

\[
\|u - v\|_{C([0, T_\omega]; \mathfrak{H}_{p,\infty})} \lesssim C_4(R) \|u_0 - v_0\|_{\mathfrak{H}_{p,\infty}}^\beta.
\]

In particular, the solution is unique. This completes the proof of Theorem 1.

\[\square\]

STABILITY FOR STRONGLY COUPLED CRITICAL ELLIPTIC SYSTEMS IN A FULLY INHOMOGENEOUS MEDIUM

OLIVIER DRUET AND EMMANUEL HEBEY

We investigate and prove analytic stability for strongly coupled critical elliptic systems in the inhomogeneous context of a compact Riemannian manifold.

Coupled systems of nonlinear Schrödinger equations are now a part of several important branches of mathematical physics. They appear in the Hartree–Fock theory for Bose–Einstein double condensates, in fiber-optic theory, in the theory of Langmuir waves in plasma physics, and in the behavior of deep water waves and freak waves in the ocean. A general reference book on such systems and their role in physics has been written by Ablowitz et al. [2004]. We focus here on coupled Gross–Pitaevskii type equations. These systems of equations are strongly related to two branches of mathematical physics. They arise [Burke et al. 1997] in the Hartree–Fock theory for double condensates, which are binary mixtures of Bose–Einstein condensates in two different hyperfine states. They also arise in the study of incoherent solitons in nonlinear optics, as describe in [Akhmediev and Ankiewicz 1998; Christodoulides et al. 1997; Hioe 1999; Hioe and Salter 2002; Kanna and Lakshmanan 2001]. Looking for standing wave solutions for these time evolution systems gives rise to their elliptic analogues that we investigate here. We consider these elliptic systems of equations in arbitrary dimensions $n \geq 3$, in the critical energy regime, and in a fully inhomogeneous medium that we model by an arbitrary compact Riemannian manifold, thus breaking the various symmetries that these systems enjoy in the Euclidean setting.

In what follows we let $(M, g)$ be a smooth compact Riemannian manifold of dimension $n \geq 3$. For $p \geq 1$ an integer, we let $M_p^s(\mathbb{R})$ denote the vector space of symmetrical $p \times p$ real matrices, and $A$ be a $C^1$ map from $M$ to $M_p^s(\mathbb{R})$. We can write $A = (A_{ij})_{i,j}$, where the $A_{ij}$’s are $C^1$ real valued functions in $M$. Let $\Delta_g = -\text{div}_g \nabla$ be the Laplace–Beltrami operator on $M$. Let also $H^1(M)$ be the Sobolev space of functions in $L^2(M)$ with one derivative in $L^2(M)$. A $p$-map $\mathcal{U} = (u_1, \ldots, u_p)$ from $M$ to $\mathbb{R}^p$ is said to be nonnegative if $u_i \geq 0$ for all $i$. The coupled system of nonlinear Schrödinger equations we consider here is written as

\begin{equation}
\Delta_g u_i + \sum_{j=1}^{p} A_{ij}(x) u_j = |\mathcal{U}|^{2^*-2} u_i
\end{equation}

in $M$ for all $i$, where $|\mathcal{U}|^2 = \sum_{i=1}^{p} u_i^2$, and $2^* = 2n/(n-2)$ is the critical Sobolev exponent for the embeddings of the Sobolev space $H^1(M)$ into Lebesgue’s spaces. The systems (0-1) are weakly coupled by the linear matrix $A$, and strongly coupled by the Gross–Pitaevskii type nonlinearity in the right hand side of (0-1). Besides, (0-1) is critical for Sobolev embeddings. From the viewpoint of conformal

geometry, our systems are pure extensions of Yamabe type equations in the strongly coupled regime. As a by-product (0-1) inherits a conformal structure.

Our aim in this paper is to discuss stability for systems like (0-1). Contrary to time evolution equations, where perturbations of the initial data together with perturbations of the equations are used to measure stability, stability for elliptic equations has to do solely with perturbations of the equations. In the framework of systems such as (0-1), stability is naturally measured with respect to perturbations of the map $A$. In what follows, a system like (0-1) is said to be analytically stable if for any sequence $(A_{\alpha})_{\alpha}$ of maps from $M$ to $M^s_p(\mathbb{R})$, $\alpha \in \mathbb{N}$, and for any bounded sequence in $H^1$ of nonnegative nontrivial solutions $\mathcal{U}_{\alpha}$ of the associated systems (0-1), if $A_{\alpha} \to A$ in $C^1$ as $\alpha \to +\infty$, then, up to a subsequence, $\mathcal{U}_{\alpha} \to \mathcal{U}$ in $C^2$ as $\alpha \to +\infty$ for some nonnegative nontrivial solution $\mathcal{U}$ of (0-1). When the strong convergence in $C^2$ is replaced by a weak convergence $\mathcal{U}_{\alpha} \rightharpoonup \mathcal{U}$ in $H^1$, the system (0-1) is said to be weakly stable. We refer to Section 1 for more precise definitions.

Before stating our theorem we need to introduce two assumptions. Let $\Delta_g$ be the Laplace–Beltrami operator acting on $p$-maps by acting on each of the components of the map, and let $\text{Vect}_+(\mathbb{R}^p)$ be the set of vectors in $\mathbb{R}^p$ with nonnegative components. The first assumption we may impose is

$$\text{Ker}(\Delta_g + A) \cap L^2(M, \text{Vect}_+(\mathbb{R}^p)) = \{0\}, \quad (H)$$

where $\text{Ker}(\Delta_g + A)$ is the kernel of $\Delta_g + A$, and $L^2(M, \text{Vect}_+(\mathbb{R}^p))$ stands for the set of $L^2$ maps from $M$ to $\text{Vect}_+(\mathbb{R}^p)$. In order to introduce our second assumption we let $A_n = A_n(A)$ be given by

$$A_n = A - \frac{n-2}{4(n-1)} S_g \text{Id}_p, \quad (0-2)$$

where $S_g$ is the scalar curvature of $g$, and $\text{Id}_p$ is the identity $p \times p$ matrix. For $x \in M$, let also $I_{\text{S}_{A_n} (x)}$ be the set consisting of the isotropic vectors for $A_n(x)$, namely of the vectors $X \in \mathbb{R}^p$ which are such that $\langle A_n(x) \cdot X, X \rangle_{\mathbb{R}^p} = 0$, where $\langle \cdot, \cdot \rangle_{\mathbb{R}^p}$ is the Euclidean scalar product in $\mathbb{R}^p$. The second assumption we introduce is that for any $x \in M$, $A_n(x)$ should not possess stable subspaces with an orthonormal basis consisting of isotropic nonnegative vectors. More precisely, it is this:

For any $x \in M$ and any $k \in \{1, \ldots, p\}$, there does not exist an orthonormal family $(e_1, \ldots, e_k)$ of vectors in $I_{\text{S}_{A_n} (x)} \cap \text{Vect}_+(\mathbb{R}^p)$ such that $A_n(x) V \subset V$, where $V$ is the $k$-dimensional subspace of $\mathbb{R}^p$ with basis $(e_1, \ldots, e_k)$. (H')

The case $k = 1$ in (H') reduces to the nonexistence of a nontrivial vector in $\text{Vect}_+(\mathbb{R}^p) \cap \text{Ker} A_n(x)$, where $\text{Ker} A_n(x)$ is the kernel of $A_n(x)$. An assumption like (H') is automatically satisfied in several simple situations. This is the case if we prevent the existence of isotropic vectors for $A_n$. In particular, (H') holds true if $A_n(x) > 0$ or $A_n(x) < 0$ for all $x$ in the sense of bilinear forms. Clearly there are other cases where (H') holds true. Assumption (H) is analytic in nature. Assumption (H') is algebraic in nature and related to the underlying geometric conformal structure of the equations. Our main result, establishing analytic stability for (0-1), is stated as follows.

**Theorem 0.1.** Let $(M, g)$ be a smooth compact Riemannian manifold of dimension $n \geq 4$ and $p \geq 1$ be an integer. For any $C^1$-map $A : M \to M^s_p(\mathbb{R})$ satisfying (H) and (H'), the system (0-1) is analytically stable when $n \neq 6$, and weakly stable when $n = 6$. Besides, there are examples of six-dimensional manifolds and $C^1$-maps $A$ satisfying (H) and (H') for which (0-1) is analytically unstable.
A closely related notion to stability is that of compactness. A system like (0-1) is said to be compact if bounded sequences in $H^1$ of nonnegative solutions of (0-1) converge, up to a subsequence, in the $C^2$-topology. As is easily seen, analytic stability implies compactness. In particular, as a direct consequence of the analytic stability part in our theorem, we get that systems like (0-1) are compact when $n \neq 6$ as soon as (H) and (H') are satisfied. Assumptions (H) and (H') in Theorem 0.1 are sharp, as discussed in Section 1 below.

Most of the asymptotic analysis developed in this paper carries over to the $n = 3$ case. However, the concluding argument needs to be changed when $n = 3$. In this dimension the mass of the Green's expansion of the Schrödinger operator $\Delta g + A$ leads over $A_g$. We can conclude when the mass is positive. The analysis is developed in [Druet et al. 2009].

The paper is organized as follows. We discuss general properties of stability and compactness in Section 1. We prove the $n = 6$ part of Theorem 0.1 in Section 2. We provide a complete classification of $H^1$-nonnegative solutions of the strongly coupled critical limit Euclidean system $\Delta u_i = |u|^{2^∗ - 2}u_i$, $i = 1, \ldots, p$, in Section 3. We prove Theorem 0.1 in its $n \neq 6$ part in Sections 4 to 10. In the process we establish in Sections 5, 6, and 8 the full $C^0$-theory for the blow-up of arbitrary sequences of solutions of strongly coupled systems like (0-1).

1. General considerations on stability and compactness

We start with the precise definition of elliptic stability we use for our systems (0-1). As already mentioned stability is here measured with respect to perturbations of the parameter $A$ in (0-1). In doing so we preserve the conformal structure of the equation. Historically speaking such type of perturbations were first considered in the early work of Aubin [1976] on the Yamabe equation. Given $(A_\alpha)_\alpha$ a sequence of $C^1$ maps from $M$ to $M^p_+(\mathbb{R})$, with $A_\alpha = (A_{ij})_{i,j}$ for all $\alpha$ integer, we consider the systems

$$\Delta_g u_i + \sum_{j=1}^p A_{ij}^\alpha(x) u_j = |u|^{2^∗ - 2} u_i. \quad (1-1)$$

A sequence $(\mathcal{U}_\alpha)_\alpha$ of $C^2$ maps from $M$ to $\mathbb{R}^p$ is said to be a sequence of nonnegative solutions of (1-1) if for any $\alpha \in \mathbb{N}$, $\mathcal{U}_\alpha = (u_1^\alpha, \ldots, u_p^\alpha)$ solves (0-1) and $u_i^\alpha \geq 0$ for all $i$. The sequence is said to be bounded in $H^1(M)$, or to have finite energy, if its components $u_i^\alpha$ are all bounded in $H^1(M)$ with respect to $\alpha$. Given $\Lambda > 0$, we define the slice $\mathcal{F}_{\Lambda}^A$ to be the set of $p$-maps $\mathcal{U} \in H^1$ such that $\mathcal{U}$ solves (0-1), $\mathcal{U}$ is nonnegative and the $H^1$-norm of $\mathcal{U}$ is less than or equal to $\Lambda$. By standard regularity, adapting classical arguments from Trudinger [1968], weak solutions in $H^1$ of systems like (0-1) are always of class $C^2$. In particular, $\mathcal{F}_{\Lambda}^A \subset C^2$ for all $\Lambda > 0$. For $X, Y \subset C^2$ we let $d_{C^2}(X; Y)$ be the $C^2$-pointed distance from $X$ to $Y$ defined by

$$d_{C^2}(X; Y) = \sup_{\mathcal{U} \in X} \inf_{\mathcal{V} \in Y} \|\mathcal{V} - \mathcal{U}\|_{C^2}, \quad (1-2)$$

where $\|\mathcal{V} - \mathcal{U}\|_{C^2} = \sum_i \|v_i - u_i\|_{C^2}$ and the $u_i$’s and $v_i$’s are the components of $\mathcal{U}$ and $\mathcal{V}$. Stability in the elliptic regime is defined in Definition 1.1 below. The $C^1$ convergence $A_\alpha \to A$ in Definition 1.1 refers to the $C^1$ convergence of the components $A_{ij}^\alpha$ of $A_\alpha$ to the components $A_{ij}$ of $A$. Similarly, the $C^2$ convergences, and the weak convergences in $H^1$, of the $\mathcal{U}_\alpha$’s in Definition 1.1 refer to the convergences of the components of the maps.
Definition 1.1. Let \((M, g)\) be a smooth compact Riemannian manifold, let \(p \geq 1\) be an integer, and let \(A : M \to M_p^R(\mathbb{R})\) be a \(C^1\) map. The system \((0-1)\) is said to be

(i) analytically stable if for any sequence \((A_\alpha)_{\alpha}\) of \(C^1\) maps from \(M\) to \(M_p^R(\mathbb{R})\) such that \(A_\alpha \to A\) in \(C^1(M)\) as \(\alpha \to +\infty\), and for any bounded sequence \((u_\alpha)_{\alpha}\) in \(H^1(M)\) of nonnegative nontrivial solutions of \((0-1)\), there exists a nonnegative nontrivial solution \(\mathcal{U}\) of \((0-1)\) such that, up to a subsequence, the \(u_\alpha\)'s converge strongly to \(\mathcal{U}\) in \(C^2(M)\) as \(\alpha \to +\infty\), and

(ii) weakly stable if for any sequence \((A_\alpha)_{\alpha}\) of \(C^1\) maps from \(M\) to \(M_p^R(\mathbb{R})\) such that \(A_\alpha \to A\) in \(C^1(M)\) as \(\alpha \to +\infty\) and for any bounded sequence \((\mathcal{U}_\alpha)_{\alpha}\) in \(H^1(M)\) of nonnegative nontrivial solutions of \((0-1)\), there exists a nonnegative nontrivial solution \(\mathcal{U}\) of \((0-1)\) such that, up to a subsequence, the \(\mathcal{U}_\alpha\)'s converge weakly to \(\mathcal{U}\) in \(H^1(M)\) as \(\alpha \to +\infty\).

The system is said to be geometrically stable, if the slices \(\mathcal{F}_A^\Lambda\) are stable for all \(\Lambda > 0\), where \(\mathcal{F}_A^\Lambda\) is said to be stable, if for any \(\varepsilon > 0\), there exists \(\delta > 0\) such that for any \(C^1\) map \(A'\) from \(M\) to \(M_p^R(\mathbb{R})\), we have \(d_{C^1}(\mathcal{F}_A^\Lambda; \mathcal{F}_{A'}^\Lambda) < \varepsilon\) when \(\|A' - A\|_{C^1} < \delta\).

As already mentioned, a classical notion in the study of critical elliptic equations is that of compactness. A system like \((0-1)\) is said to be compact if any bounded sequence \((u_\alpha)_{\alpha}\) in \(H^1(M)\) of nonnegative nontrivial solutions of \((0-1)\) converges in \(C^2(M)\) as \(\alpha \to +\infty\) to a nonnegative nontrivial solution \(\mathcal{U}\) of \((0-1)\). This corresponds to the particular situation where \(A_\alpha = A\) for all \(\alpha\) in (i). Analytic stability as defined in (i) implies weak stability, geometric stability, and compactness. More precisely:

Proposition 1.2. Assume \((H)\). If the system \((0-1)\) is analytically stable, it is weakly stable, geometrically stable, and compact. A compact system is analytically stable if and only if it is geometrically stable.

Proof. It is obvious that analytic stability implies weak stability, geometric stability, and compactness. The only assertion, which deserves to be proved, is that a compact geometrically stable system like \((0-1)\) is analytically stable. Let \((A_\alpha)_{\alpha}\) be a sequence of \(C^1\) maps from \(M\) to \(M_p^R(\mathbb{R})\) such that \(A_\alpha \to A\) in \(C^1(M)\) as \(\alpha \to +\infty\), and let \((u_\alpha)_{\alpha}\) be a bounded sequence in \(H^1\) of nonnegative nontrivial solutions of \((0-1)\). Since \((0-1)\) is geometrically stable, there exists \((\mathcal{V}_\alpha)_{\alpha}\), a bounded sequence in \(H^1\) of nonnegative nontrivial solutions of \((0-1)\), such that, up to a subsequence, \(u_\alpha - \mathcal{V}_\alpha\) converges to zero in \(C^2\) as \(\alpha \to +\infty\). Since \((0-1)\) is compact, up to a subsequence, \(\mathcal{V}_\alpha \to \mathcal{V}\) in \(C^2\) as \(\alpha \to +\infty\), where \(\mathcal{V}\) is a nonnegative solution of \((0-1)\). In particular, up to a subsequence, \(u_\alpha \to \mathcal{V}\) in \(C^2\) as \(\alpha \to +\infty\). It remains to prove that \(\mathcal{V}\) is nontrivial, and this is given by Lemma 1.3 below. Proposition 1.2 is proved. \(\square\)

The following lemma, which we derive as a direct consequence of \((H)\), was used in the proof of Proposition 1.2. By standard elliptic theory, moreover, when \(A\) satisfies \((H)\), we have \(u_\alpha \not\to 0\) in \(H^1\) as \(\alpha \to +\infty\).

Lemma 1.3. Let \((M, g)\) be a smooth compact Riemannian manifold, let \(p \geq 1\) be an integer, and let \(A : M \to M_p^R(\mathbb{R})\) be a \(C^1\) map satisfying \((H)\). Let \((A_\alpha)_{\alpha}\) be a sequence of \(C^1\) maps from \(M\) to \(M_p^R(\mathbb{R})\) such that \(A_\alpha \to A\) in \(C^1(M)\) as \(\alpha \to +\infty\), and let \((u_\alpha)_{\alpha}\) be a bounded sequence in \(H^1\) of nonnegative nontrivial solutions of \((1-1)\). Then \(u_\alpha \not\to 0\) in \(L^\infty(M)\) as \(\alpha \to +\infty\).

Proof. By contradiction we assume that there exists \((u_\alpha)_{\alpha}\), a bounded sequence in \(H^1\) of nonnegative nontrivial solutions of \((1-1)\), such that \(\max_M |u_\alpha|_\Sigma \to 0\) as \(\alpha \to +\infty\), where \(|u_\alpha|_\Sigma = \sum_i u_{i,\alpha}\) is the sum of the components of the \(u_\alpha\)'s. Let \(\varepsilon_\alpha = |u_\alpha|_\Sigma\) and define \(v_{i,\alpha}\) by \(v_{i,\alpha} = \varepsilon^{-1}_\alpha u_{i,\alpha}\) for all \(i\) and \(\alpha\). Then
for all \( i \) and \( \alpha \), where \( \mathcal{V}_a \) is the \( p \)-map whose components are the \( v_{i,a} \)'s for \( i = 1, \ldots, p \). By construction the \( v_{i,a} \)'s are bounded in \( L^\infty(M) \). By standard elliptic theory it follows that, up to a subsequence, they converge in \( C^2(M) \) to \( v_i \) as \( \alpha \to +\infty \). Let \( \mathcal{V} \) be the \( p \)-map with components \( v_i \) for \( i = 1, \ldots, p \). By construction \( \mathcal{V} \) is nonnegative and nontrivial, since there is one point, where \( |\mathcal{V}|_\Sigma \) equals one. Letting \( \alpha \to +\infty \) in (1-3) it follows that \( \mathcal{V} \in \text{Ker}(\Delta_g + A) \), and we get a contradiction with (H).

Proposition 1.2 leaves open the question of whether or not there exist geometrically stable noncompact systems like (0-1). However, we can have noncompact systems with geometrically stable specific slices as discussed below. The most well-known example of a noncompact critical system like (0-1) is given by the Yamabe equation on the sphere. The Yamabe equation on the \( n \)-sphere possesses a \((n+1)\)-parameter noncompact family of solutions and it turns out that it is also geometrically unstable. This is a direct consequence of the constructions in [Druet and Hebey 2005a], where arbitrarily high energy solutions of approximated equations are constructed, together with the property that all nonnegative nontrivial solutions of the Yamabe equation on the sphere have the same energy. On the other hand, the first blow-up slice for this equation is geometrically \( H^1 \)-stable in the sense of Definition 1.1 when we replace the \( C^2 \)-pointed distance and the \( C^2 \)-norm in (1-2) by a \( H^1 \)-pointed distance and a \( H^1 \)-norm, where the first blow-up slice is given by \( \Lambda = K^2_{\alpha} \), and \( K_{\alpha} \) is as in (3-8). This geometric \( H^1 \)-stability of the first blow-up slice follows from \( H^1 \)-decompositions as in Proposition 4.2. As a direct consequence, noncompact equations may have stable slices.

In the subcritical regime, compactness goes back to [Gidas and Spruck 1981]. In the more involved critical regime, it goes back to Schoen’s conjecture [Schoen 1989; 1991] that compactness holds true for the geometric Yamabe equation as soon as the background manifold is distinct from the sphere. His conjecture has been a source of motivations for several years. The conjecture was proved to be true for conformally flat manifolds by Schoen [1989; 1991]. The nonconformally flat case turned out to be more intricate. The case of low-dimensional manifolds was recently addressed in [Druet 2004; Marques 2005; Li and Zhu 1999; Li and Zhang 2004; 2005], and compactness up to dimension 24 was finally proved recently [Khuri et al. 2009]. On the other hand, Brendle [2008a] and Brendle and Marques [2009] exhibited counterexamples to the conjecture in dimensions \( n \geq 25 \). For any \( n \geq 25 \) they constructed examples of nonconformally flat \( n \)-manifolds with the striking property that their associated Yamabe equations possess sequences of solutions with minimal type energy and unbounded \( L^\infty \)-norms. In particular, they proved the very surprising result that the compactness conjecture is false for nonconformally flat manifolds in any dimension \( n \geq 25 \). A very interesting survey on the subject is [Brendle 2008b]. We refer also to [Druet and Hebey 2005b].

An easy remark is that if \( u \) is a solution of a scalar Yamabe type equation with linear term \( h \), that is, an equation of the form

\[
\Delta_g u + h(x)u = u^{2^*-1},
\]

then \( \mathcal{U} = (\frac{1}{\sqrt{p}}u, \ldots, \frac{1}{\sqrt{p}}u) \) is a solution of (0-1) when \( A_{ij} = ha_{ij} \) for all \( i, j \), and \( \sum_{j=1}^{p} a_{ij} = 1 \) for all \( i \). In what follows we let \( (a_{ij})_{i,j} \) be a symmetrical matrix of \( C^1 \) functions \( a_{ij} : M \to \mathbb{R} \) such that \( \sum_{j=1}^{p} a_{ij}(x) = 1 \) for all \( i = 1, \ldots, p \) and all \( x \in M \). A possible choice is \( a_{ij} = \delta_{ij} \) for all \( i, j \). Then we
define $A(g)$ and $A'(g)$ to be the $C^1$ maps from $M$ to $M^4_p(\mathbb{R})$ given by

$$A(g)_{ij} = \frac{n-2}{4(n-1)} S_g a_{ij} \quad \text{and} \quad A'(g)_{ij} = \frac{n-2}{4(n-1)} (\max_M S_g) a_{ij}$$

for all $i, j = 1, \ldots, p$, where $S_g$ is the scalar curvature of $g$. By combining results in [Brendle 2008a; Brendle and Marques 2009], where noncompactness of the Yamabe equation in the nonconformally flat case is investigated, and those in [Druet and Hebey 2005a; Hebey and Vaugon 2001], where unstability of Yamabe type equations in the conformally flat case is investigated, we obtain the following theorem, in view of the remark above.

**Theorem 1.4.** The system (0-1) associated with $A(g)$ is analytically unstable when posed on spherical spaces forms in any dimension $n \geq 6$, and even noncompact when posed on the sphere in any dimension $n \geq 3$. For any conformally flat manifold $(M, g)$ of dimension $n \geq 4$ there exists a conformal metric $\tilde{g}$ to $g$ of nonconstant scalar curvature having one and only one maximum point such that the system (0-1) associated with $A'(\tilde{g})$ is analytically unstable. In any dimension $n \geq 25$ there are examples of nonconformally flat manifolds such that the system (0-1) associated with $A(g)$ is noncompact, and thus also analytically unstable.

The examples in Theorem 1.4 do not satisfy (H′). This can be checked by noting that $(1, \ldots, 1) \in \text{Ker} A_n(x)$ for all $x$, where $A_n$ is as in (0-2). Theorem 0.1 and Theorem 1.4 complement each other. As a remark, the Yamabe equation on quotients of the sphere is obviously compact since it possesses a unique solution. In particular, there are compact equations which are neither analytically nor geometrically stable. Compactness does not imply stability. We concentrate in the rest of this section on the subcritical regime for systems like (0-1) and prove that analytic stability holds true in the subcritical regime without assuming (H′). Let $q \in (2, 2^*)$ and let us consider the subcritical system

$$\Delta_g u_i + \sum_{j=1}^p A_{ij}(x) u_j = |u|^{q-2} u_i$$

in $M$ for all $i$, where $A = (A_{ij})_{i,j}$ is a $C^1$ map from $M$ to $M^4_p(\mathbb{R})$. We define the notions of analytic stability, weak stability, and geometric stability for (1-5) as in Definition 1.1.

**Proposition 1.5.** Let $(M, g)$ be a smooth compact Riemannian manifold of dimension $n \geq 3$, $p \geq 1$ be an integer, and $A : M \to M^4_p(\mathbb{R})$ be a $C^1$ map satisfying (H). For any $q \in (2, 2^*)$ the subcritical system (1-5) is analytically stable.

**Proof.** Let $(A_a)_{a}$ be a sequence of $C^1$ maps from $M$ to $M^4_p(\mathbb{R})$ such that $A_a \to A$ in $C^1(M)$ as $a \to +\infty$, and let $(u_a)_{a}$ be an arbitrary bounded sequence in $H^1$ of nonnegative nontrivial solutions of

$$\Delta_g u_{i,a} + \sum_{j=1}^p A_{ij}^a(x) u_{j,a} = |u_a|^{q-2} u_{i,a}$$

for all $i$ and all $a$. We aim in proving that a subsequence of $(u_a)_{a}$ converges in $C^2$ to a nonnegative nontrivial solution of (1-6). The nontriviality of any strong limit follows from (H) mimicking the proof of Lemma 1.3. Then, as is easily checked, it suffices to prove that the $u_a$’s are $L^\infty$-bounded in $M$. By contradiction we assume that there exists a sequence $(x_a)_{a}$ of points, where the $|u_a|$’s are maximum
such that, up to a subsequence, \( |\tilde{u}_a(x_a)| \to +\infty \) as \( a \to +\infty \). Let \( \mu_a = |\tilde{u}_a(x_a)|^{-(q-2)/2} \). Then \( \mu_a \to 0 \) as \( a \to +\infty \). Let \( \tilde{u}_a \) be given for \( x \in \mathbb{R}^n \) by

\[
\tilde{u}_a(x) = \mu_a^{2/(q-2)} \tilde{u}_a(\exp_{x_a}(\mu_a x))
\]

and let \( g_\alpha \) be the metric given by \( g_\alpha(x) = (\exp^* x g_\alpha:\mu_a x) \). We have \( g_\alpha \to \xi \) in \( C^2_{\text{loc}}(\mathbb{R}^n) \) as \( a \to +\infty \), where \( \xi \) is the Euclidean metric. Noting that

\[
\Delta_{g_\alpha} \tilde{u}_{i,\alpha} + \mu_\alpha^2 \sum_{j=1}^p A_{ij}^\alpha(\exp_{x_a}(\mu_a x)) \tilde{u}_{j,\alpha} = |\tilde{u}_a|^{q-2} \tilde{u}_{i,\alpha}
\]

for all \( i \) and \( \alpha \), since \( |\tilde{u}_a| \leq 1 \) for all \( a \) by construction, it follows from standard elliptic theory that there exists \( \tilde{u} \in C^2(\mathbb{R}^n) \) such that, up to a subsequence, \( \tilde{u}_a \to \tilde{u} \) in \( C^2_{\text{loc}}(\mathbb{R}^n) \). We have \( |\tilde{u}_a(0)| = 1 \) for all \( a \). Hence, \( |\tilde{u}(0)| = 1 \). Moreover, for any \( R > 0 \), and for \( a \) sufficiently large,

\[
\int_{B_R(0)} |\tilde{u}|^q \, dx \leq C \int_{B_R(0)} |\tilde{u}_a|^q \, dv_{g_\alpha}
\]

\[
\leq C \int_{B_R(1/\mu_\alpha)} |\tilde{u}_a|^q \, dv_{g_\alpha} = C \mu_\alpha^{2q/(q-2)-n} \int_{B_1(1)} |\tilde{u}_a|^q \, dv_g \leq C \mu_\alpha^{2q/(q-2)-n},
\]

since the \( \tilde{u}_a \)’s have bounded energy. Noting that \( 2q/(q-2) > n \) as soon as \( q < 2^* \) and letting \( a \to +\infty \) in the inequality above, we get \( \int_{B_R(0)} |\tilde{u}|^q \, dx = 0 \). This is in contradiction with \( |\tilde{u}(0)| = 1 \). The proposition is proved.

Analytic stability for critical equations like (1-4) has been investigated in [Druet 2003]. The case \( p = 1 \) in Theorem 0.1, in its \( n \neq 6 \) part and when considering \( C^{2,\alpha} \)-perturbations of \( h \), was proved in the same paper. The proof we propose here extends to the case of systems, allows us to consider \( C^{0,\eta} \)-perturbations of \( h \), see the remark at the end of Section 10, and is more direct. At the time of [Druet 2003], analytic stability was still referred to as compactness. The confusion in the terminology has been the source of several misunderstandings.

2. The six-dimensional case

We discuss and prove the six-dimensional last assertion in Theorem 0.1 concerning the existence of systems like (0-1) in dimension \( n = 6 \), which satisfy (H) and (H'), but which, contrary to what happens when \( n \neq 6 \), are not analytically stable. We restrict ourselves to a very explicit construction in the case of the unit sphere \( (S^6, g_0) \). A more general discussion could have been developed. We let \( (a_{ij})_{i,j} \) be a symmetrical matrix of \( C^1 \) functions \( a_{ij} : S^6 \to \mathbb{R} \) such that \( \sum_{j=1}^p a_{ij}(x) = 1 \) for all \( i = 1, \ldots, p \) and all \( x \in S^6 \). If \( h : S^6 \to \mathbb{R} \) is of class \( C^1 \), we define \( A(h) \) to be the \( C^1 \) map from \( S^6 \) to \( M_p^*(\mathbb{R}) \) with components \( A(h)_{ij} \) given by \( A(h)_{ij} = h a_{ij} \) for all \( i, j = 1, \ldots, p \). When \( n = 6 \), we have \( 2^* = 3 \). For the unit sphere \( (S^6, g_0) \), we also have

\[
\frac{n-2}{4(n-1)} S_{g_0} = 6.
\]

**Proposition 2.1.** Let \( (S^6, g_0) \) be the unit six-dimensional sphere in \( \mathbb{R}^7 \). There exists \( h : S^6 \to \mathbb{R} \), \( h > 6 \) everywhere and of class \( C^1 \), such that the system (0-1) associated with \( A = A(h) \) is analytically unstable.
Proof. We fix \(x_0 \in S^6\) and let \(r\) be the distance to \(x_0\). We let also \(\theta\) be given by \(\theta = \cos r\). First we claim that there exist smooth positive functions \(h\) and \(u\) in \(S^6\), which we write into the form \(h(x) = \hat{h}(\theta)\) and \(u(x) = \hat{u}(\theta)\), such that

\[
\Delta_{g_0} u + hu = u^2 \quad \text{and} \quad h > 6
\]

in \(S^6\), and such that

\[
\hat{h}(1) = 3\hat{u}(1), \quad \hat{u}(1) = 6 \quad \text{and} \quad \hat{h}'(1) = 2\hat{u}'(1).
\]

To prove the claim we let \(\hat{u}\) be given by

\[
\hat{u}(\theta) = 6(1 - 2(\theta - 1) + 3(\theta - 1)^2).
\]

Clearly, \(\hat{u}(1) = 6\) and \(\hat{u}'(1) = -12\). Since \(\Delta_{g_0}\theta = 6\theta\) and \(|\nabla \theta|^2 = 1 - \theta^2\), we get

\[
\frac{1}{6} \Delta_{g_0} u = 6(7\theta^2 - 8\theta - 1).
\]

In particular, the first equation in (2-1) is satisfied if we let \(\hat{h}\) be given by

\[
\frac{1}{6} \hat{h}(\theta) = 3\theta^2 - 8\theta + 6 - \frac{7\theta^2 - 8\theta - 1}{3\theta^2 - 8\theta + 6}.
\]

As is easily checked from (2-4), \(\hat{h}(1) = 3\hat{u}(1)\) and \(\hat{h}'(1) = 2\hat{u}'(1)\). In particular, (2-2) holds true. Noting that \(\hat{h} > 6\) for all \(\theta \in [-1, +1]\), we get two explicit smooth positive functions \(h\) and \(u\) in \(S^6\), given by (2-3) and (2-4), such that (2-1) and (2-2) hold true. This proves the above claim. Now, for \(\beta > 1\), we define \(B_\beta\) by \(B_\beta(x) = \hat{B}_\beta(\theta)\), where

\[
\hat{B}_\beta(\theta) = 6(\beta^2 - 1)(\beta - \theta)^{-2}.
\]

We have \(\Delta_{g_0} B_\beta + 6B_\beta = B^2_\beta\) in \(S^6\). Let

\[
u_\beta = u + B_\beta
\]

and \(\hat{u}_\beta = \hat{u} + \hat{B}_\beta\), where \(u\) and \(\hat{u}\) are as in (2-1) and (2-2). As is easily checked from (2-1) and the equation satisfied by \(B_\beta\), we have

\[
\Delta_{g_0} u_\beta + hu_\beta = u^2_\beta
\]

in \(S^6\) for all \(\beta > 1\), where \(h_\beta = \hat{h}_\beta(\theta)\) is given by

\[
\hat{h}_\beta = \hat{h} - \frac{(12\hat{u} + 6 - \hat{h})\hat{B}_\beta}{\hat{u} + \hat{B}_\beta}.
\]

Noting, thanks to (2-2), that \(h_\beta \to h\) in \(C^0_{\text{loc}}(S^6)\) as \(\beta \to 1\), while \(\hat{h}_\beta \to \hat{h}'\) in \(L^\infty([-1, +1])\) as \(\beta \to 1\), we conclude that \(h_\beta \to h\) in \(C^1(S^6)\). Now we let \((\beta_\alpha)\alpha\) be a sequence of positive real numbers such that \(\beta_\alpha > 1\) for all \(\alpha\) and \(\beta_\alpha \to 1\) as \(\alpha \to +\infty\). We let \(u_\alpha = p^{-1/2}(u_{\beta_\alpha}, \ldots, u_{\beta_\alpha})\), \(A_\alpha = A(h_{\beta_\alpha})\), and \(A = A(h)\) where \(u_\beta\) is given by (2-5), \(h_\beta = \hat{h}_\beta(\theta)\) is given by (2-7), and \(h = \hat{h}(\theta)\) is given by (2-4).

The \(u_\alpha\)'s solve (1-1), they have bounded energy, and \(A_\alpha \to A\) in \(C^1\). Noting that \(\|u_\alpha\| \to +\infty\) as \(\alpha \to +\infty\), this proves the proposition.

It is easily checked that \(A = A(h)\) satisfies (H). If \(\mathcal{U} \in L^2(M, \text{Vect}_+(\mathbb{R}^p))\) is in the kernel of the vector Schrödinger operator associated with \(A(h)\), we conclude by summing over the components that \(\|\mathcal{U}\| = \sum_{i=1}^p u_i\) belongs to \(\text{Ker}(\Delta_{g_0} + h)\). This is impossible unless \(\mathcal{U} \equiv 0\) since \(h > 0\). It is also easily seen that, at least for small perturbations \(a_{ij}\) of \(\delta_{ij}\), the map \(A = A(h)\) satisfies (H').
3. The limit system

Of importance in blow-up theory, when discussing critical equations, is the classification of the solutions of the critical limit Euclidean system we get by blowing up the original equations. In our case, we need to classify the $\dot{H}^1$-nonnegative solutions of the limit system

$$\Delta u_i = |u|^2 - u_i,$$

where $|u|^2 = \sum_{i=1}^p u_i^2$, and $\Delta = -\sum_{i=1}^n \partial^2/\partial x_i^2$ is the Euclidean Laplace–Beltrami operator. Depending on the context, we let $\dot{H}^1(\mathbb{R}^n)$ be the homogeneous Sobolev space defined as the completion of functions with compact supports, or of $p$-maps with compact supports, with respect to the $L^2$-norm of their gradient. The classification result we prove here is stated as follows.

**Proposition 3.1.** Let $p \geq 1$ and $u \in \dot{H}^1(\mathbb{R}^n)$ be a nonnegative solution of (3-1). Then there exist $a \in \mathbb{R}^n$, $\lambda > 0$, and $\Lambda \in S^{p-1}_+$, such that

$$u(x) = \left(\frac{\lambda}{\lambda^2 + |x-a|^2/n(n-2)}\right)^{(n-2)/2} \Lambda$$

for all $x \in \mathbb{R}^n$, where $S^{p-1}_+$ consists of those elements $(\Lambda_1, \ldots, \Lambda_p)$ in the unit sphere $S^{p-1}$ (in $\mathbb{R}^p$) that satisfy $\Lambda_i \geq 0$ for all $i$.

We prove Proposition 3.1 in several steps. Let $u \in \dot{H}^1(\mathbb{R}^n)$ be a nonnegative solution of (3-1). Regularity theory and the maximum principle apply to (3-1). In particular, $u$ is necessarily smooth with the property that for any $i$, either $u_i \equiv 0$ or $u_i > 0$ in $\mathbb{R}^n$. We may therefore assume that there exists $p' \leq p$ such that $u_i > 0$ in $\mathbb{R}^n$ for all $i = 1, \ldots, p'$. A first step in the proof of Proposition 3.1 is as follows.

**Step 1.** Let $u \in \dot{H}^1(\mathbb{R}^n)$ be a nonnegative solution of (3-1) such that $u_i > 0$ in $\mathbb{R}^n$ for all $i = 1, \ldots, p'$, $p' \leq p$. Then, for any $R > 0$,

$$\min_{\partial B_0(R)} \frac{u_i}{u_j} \leq \frac{u_i}{u_j} \leq \max_{\partial B_0(R)} \frac{u_i}{u_j}$$

in $B_0(R)$ for all $i, j \in \{1, \ldots, p'\}$.

**Proof of Step 1.** By (3-1),

$$\Delta \left(\frac{u_i}{u_j}\right) = 2 \left(\nabla \left(\frac{u_i}{u_j}\right), \nabla u_j\right) u_j^{-1}.$$

Applying the maximum principle we get (3-3). □

The main objective now is to prove that

$$\min_{\partial B_0(R)} \frac{u_i}{u_j} \to \lambda_{i,j}$$

and

$$\max_{\partial B_0(R)} \frac{u_i}{u_j} \to \lambda_{i,j}$$

as $R \to +\infty$ for some $\lambda_{i,j} > 0$ so that, together with Step 1, we obtain $u_i = \lambda_{i,j} u_j$ in $\mathbb{R}^n$ for all $i, j = 1, \ldots p'$. To prove (3-4) we first observe that

$$|x|^{(n-2)/2} u_i(x) \to 0$$
as $|x| \to +\infty$ for all $i \in \{1, \ldots, p'\}$. Indeed, let $r > 0$, and $V_r = r^{(n-2)/2}U(r \cdot)$. We have $\Delta V_r = |V_r|^{2^* - 2}V_r$ and
\[
\int_{B_0(2) \setminus B_0(1/2)} |V_r|^{2^*} \, dx \to 0 \quad \text{as} \quad r \to +\infty,
\]
since $u_i \in L^{2^*}(\mathbb{R})$ for all $i$. Then $v_i' \to 0$ in $C^0_{\text{loc}}(B_0(\frac{3}{2}) \setminus B_0(\frac{3}{4}))$ as $r \to +\infty$ for all $i$, where the $v_i'$'s are the components of $V_r$. This proves (3-5). Now, in order to prove (3-4), we prove that the following step holds true.

**Step 2.** Let $u \in H^1(\mathbb{R}^n)$ be a nonnegative solution of (3-1) such that $u_i > 0$ in $\mathbb{R}^n$ for all $i = 1, \ldots, p'$, $p' \leq p$. For any $0 < \varepsilon < \frac{1}{2}$, there exists $C_\varepsilon > 0$ such that
\[
u_i(x) \leq C_\varepsilon |x|^{(2-n)(1-\varepsilon)}
\]
for all $x \in \mathbb{R}^n$ and all $i \in \{1, \ldots, p'\}$.

**Proof of Step 2.** Let $0 < \varepsilon < \frac{1}{2}$ and $R_\varepsilon > 0$ be such that
\[
\sup_{x \in \mathbb{R}^n \setminus \partial B_0(R_\varepsilon)} |x|^2 |U(x)|^{2^* - 2} \leq \frac{(n-2)^2}{2} \varepsilon (1-\varepsilon).
\]
It is always possible to find such a $R_\varepsilon$ thanks to (3-5). For $R \geq R_\varepsilon$, we let
\[
\eta(R) = \max_{i=1, \ldots, p'} \max_{\partial B_0(R)} u_i
\]
and
\[
G_\varepsilon(x) = \eta(R_\varepsilon) \left( \frac{|x|}{R_\varepsilon} \right)^{(2-n)(1-\varepsilon)} + \eta(R) \left( \frac{|x|}{R} \right)^{(2-n)\varepsilon}.
\]
It is clear that $u_i \leq G_\varepsilon$ on $\partial B_0(R_\varepsilon) \cup \partial B_0(R)$. Let us assume that $\frac{u_i}{G_\varepsilon}$ possesses a local maximum at $x \in B_0(R) \setminus B_0(R_\varepsilon)$. Then
\[
\frac{\Delta u_i(x)}{u_i(x)} \geq \frac{\Delta G_\varepsilon(x)}{G_\varepsilon(x)}.
\]
Since
\[
\frac{\Delta G_\varepsilon(x)}{G_\varepsilon(x)} = \varepsilon (1-\varepsilon)(n-2)^2 |x|^{-2},
\]
we get
\[
|x|^2 |U(x)|^{2^* - 2} \geq \varepsilon (1-\varepsilon)(n-2)^2.
\]
But this is absurd by the choice of $R_\varepsilon$ we made. Thus we can write, for any $R > R_\varepsilon$ and any $i \in \{1, \ldots, p'\}$,
\[
u_i(x) \leq \eta(R_\varepsilon) \left( \frac{|x|}{R_\varepsilon} \right)^{(2-n)(1-\varepsilon)} + \eta(R) \left( \frac{|x|}{R} \right)^{(2-n)\varepsilon}
\]
in $B_0(R) \setminus B_0(R_\varepsilon)$. Fix $x \in \mathbb{R}^n \setminus B_0(R_\varepsilon)$. Passing to the limit as $R \to +\infty$ in (3-6), since, by (3-5), $R^{(n-2)/2} \eta(R) \to 0$ as $R \to +\infty$, we get
\[
\nu_i(x) \leq \eta(R_\varepsilon) \left( \frac{|x|}{R_\varepsilon} \right)^{(2-n)(1-\varepsilon)}.
\]
This ends the proof of Step 2. □
Step 3. Let $u \in \dot{H}^1(\mathbb{R}^n)$ be a nonnegative solution of (3-1) such that $u_i > 0$ in $\mathbb{R}^n$ for all $i = 1, \ldots, p'$, $p' \leq p$. Then $u_i \in L^{2^*_i - 1}(\mathbb{R}^n)$ and

$$\lim_{|x| \to +\infty} |x|^{n-2} u_i(x) = \frac{1}{(n-2)\omega_{n-1}} \int_{\mathbb{R}^n} |U|^2 u_i \, dx$$

for all $i \in \{1, \ldots, p'\}$.

**Proof of Step 3.** We apply Green’s representation formula in $B_x(R)$ and get

$$u_i(x) = \frac{1}{(n-2)\omega_{n-1}} \int_{B_x(R)} \left( |x-y|^{2-n} - R^{2-n} \right) |U(y)|^{2^*_i-2} u_i(y) \, dy + \frac{1}{\omega_{n-1} R^{n-1}} \int_{\partial B_x(R)} u_i \, d\sigma.$$ 

Thanks to the estimate of Step 2 with $0 < \varepsilon < 2/(n+2)$, we have $u_i \in L^{2^*_i-1}(\mathbb{R}^n)$ for all $i$. Passing to the limit as $R \to +\infty$ we obtain

$$u_i(x) = \frac{1}{(n-2)\omega_{n-1}} \int_{\mathbb{R}^n} |x-y|^{2-n} |U(y)|^{2^*_i-2} u_i(y) \, dy.$$ 

Thus

$$|x|^{n-2} u_i(x) = \frac{1}{(n-2)\omega_{n-1}} \int_{\mathbb{R}^n} \frac{|x|^{n-2}}{|x-y|^{n-2}} |U(y)|^{2^*_i-2} u_i(y) \, dy$$

$$= \frac{1}{(n-2)\omega_{n-1}} \left( \int_{B_x(R)} |U(y)|^{2^*_i-2} u_i(y) \, dy + o_R(1) + \int_{\mathbb{R}^n \setminus B_x(R)} \frac{|x|^{n-2}}{|x-y|^{n-2}} |U(y)|^{2^*_i-2} u_i(y) \, dy \right),$$

where $o_R(1) \to 0$ as $|x| \to +\infty$. Now, using Step 2, we write

$$\int_{\mathbb{R}^n \setminus B_x(R)} \frac{|x|^{n-2}}{|x-y|^{n-2}} |U(y)|^{2^*_i-2} u_i(y) \, dy$$

$$\leq N^{2^*_i-2} C_{2^*_i-1} \int_{B_x(|x|/2)} \frac{|x|^{n-2}}{|x-y|^{n-2}} \, dy \left( \frac{|x|}{2} \right)^{-2} + 2^{n-2} \int_{\mathbb{R}^n \setminus B_x(R)} |U(y)|^{2^*_i-2} u_i(y) \, dy$$

$$\leq N^{2^*_i-2} C_{2^*_i-1} 2^{(n+2)(1-\varepsilon)-2} \omega_{n-1} |x|^{-(n+2)(1-\varepsilon)} + 2^{n-2} \int_{\mathbb{R}^n \setminus B_x(R)} |U(y)|^{2^*_i-2} u_i(y) \, dy.$$ 

Choosing $0 < \varepsilon < \frac{2}{n+2}$, we thus obtain that

$$\lim_{R \to +\infty} \limsup_{|x| \to +\infty} \int_{\mathbb{R}^n \setminus B_x(R)} \frac{|x|^{n-2}}{|x-y|^{n-2}} |U(y)|^{2^*_i-2} u_i(y) \, dy = 0.$$

This ends the proof of Step 3. □

Using Steps 1 and 3 we are now in a position to prove (3-4), and then Proposition 3.1.

**Proof of Proposition 3.1.** Let $u \in \dot{H}^1(\mathbb{R}^n)$ be a nonnegative solution of (3-1) such that $u_i > 0$ in $\mathbb{R}^n$ for all $i = 1, \ldots, p'$, $p' \leq p$. Since the $u_i$’s are all positive for $i = 1, \ldots, p'$, we get from Step 3 that

$$\min_{\partial B_0(R)} u_i, \max_{\partial B_0(R)} u_i \to \lambda_{i,j}$$
as \( R \to +\infty \), where \( \lambda_{i,j} > 0 \) is given by
\[
\lambda_{i,j} = \frac{\int_{\mathbb{R}^n} |U|^{2^*-2} u_i \, dx}{\int_{\mathbb{R}^n} |U|^{2^*-2} u_j \, dx}.
\]

In particular, (3-4) holds true. Thanks to Step 1, we thus get
\[ u_i = \tilde{\lambda}_i u_1 \]
for all \( i \in \{1, \ldots, p'\} \) where \( \tilde{\lambda}_i = \lambda_{i,1} \). By (3-1) we then get
\[ \Delta u_1 = |\Lambda'|^{2^*-2} u_1^{2^*-1} \]
in \( \mathbb{R}^n \) where \( \Lambda' = (\lambda_i)_{i=1}^{p'} \). By [Caffarelli et al. 1989] we can write
\[ u_1(x) = |\Lambda'|^{-1} \left( \frac{\mu}{\mu^2 + \frac{|x-x_0|^2}{n(n-2)}} \right)^{(n-2)/2} \]  
(3-7)
for some \( x_0 \in \mathbb{R}^n \) and some \( \mu > 0 \). In particular, since \( u_i = \lambda_i u_1 \), we get with (3-7) that (3-2) holds true with \( \Lambda = (\Lambda_i)_i \), where \( \Lambda_i = |\Lambda'|^{-1} \lambda_i \) for all \( i = 1, \ldots, p' \), and \( \lambda_i = 0 \) for all \( i > p' \). Clearly, \( |\Lambda| = 1 \).
This ends the proof of Proposition 3.1. \( \square \)

Let \( K_n \) be the sharp constant for the Sobolev inequality \( \|u\|_{2^*} \leq K \|\nabla u\|_2 \) corresponding to the embedding \( \dot{H}^1(\mathbb{R}^n) \subset L^{2^*}(\mathbb{R}^n) \). Then, as is well known,
\[ K_n = \sqrt{\frac{4}{n(n-2)\omega_n^{2/n}}} \]  
(3-8)
where \( \omega_n \) is the volume of the unit sphere. The multipliers in (3-2), which we get by taking the Euclidean norm \( |\mathcal{U}| \) of \( \mathcal{U} \) in (3-2), turn out to be extremal functions for the sharp Euclidean Sobolev inequality \( \|u\|_{2^*} \leq K_n \|\nabla u\|_2 \). As a direct consequence of Proposition 3.1 we then get
\[ \int_{\mathbb{R}^n} |\mathcal{U}|^{2^*} \, dx = K_n^{-n} \]  
(3-9)
for all nonnegative solutions \( \mathcal{U} \in \dot{H}^1(\mathbb{R}^n) \) of (3-1), where \( K_n \) is as in (3-8). Proposition 3.1, combined with the moving sphere approach, gives the full classification of nonnegative solutions of (3-1), namely without the requirement that \( \mathcal{U} \in \dot{H}^1 \). This is carried out in [Druet et al. 2009].

4. Weak pointwise estimates

Let \((M, g)\) be a smooth compact Riemannian manifold of dimension \( n \geq 3 \), \( p \geq 1 \) be an integer, and \((x_\alpha)_\alpha\) be a converging sequence of points in \( M \). Let also \((\lambda_\alpha)_\alpha\) be a sequence of positive real numbers. For \( \mathcal{U}: M \to \mathbb{R}^p \) and \( \mathcal{V}: \mathbb{R}^n \to \mathbb{R}^p \), we define the direct \( \tilde{R}^{\lambda_\alpha}_{x_\alpha}\) -rescalings and the inverse \( \tilde{R}^{\lambda_\alpha}_{x_\alpha}^{-1}\) -rescalings by
\[ (\tilde{R}^{\lambda_\alpha}_{x_\alpha}\mathcal{U})(x) = \lambda_\alpha^{(n-2)/2} \mathcal{U}(\exp_{x_\alpha}(\lambda_\alpha x)) \quad \text{and} \quad (\tilde{R}^{\lambda_\alpha}_{x_\alpha}^{-1}\mathcal{V})(x) = \lambda_\alpha^{(n-2)/2} \mathcal{V}(\lambda_\alpha \exp_{x_\alpha}^{-1}(x)), \]  
(4-1)
where \( x \) in the first equation is a variable in \( \mathbb{R}^n \), \( x \) in the second equation is a variable in \( M \), localized around the limit of the \( x_\alpha \)'s, and \( \exp_{x_\alpha} \) is the exponential map at \( x_\alpha \).
**Definition 4.1.** Let \((M, g)\) be a smooth compact Riemannian manifold of dimension \(n \geq 3\) and \(p \geq 1\) be an integer. A \(p\)-vector bubble is a sequence \((\mathcal{B}_a)_a\) of \(p\)-maps from \(M\) to \(\mathbb{R}^p\) given by

\[
\mathcal{B}_a(x) = \left(\frac{\mu_a}{\mu_a^2 + d_g(x_a, x)^2/n(n-2)}\right)^{(n-2)/2} \Lambda
\]

for all \(x \in M\) and all \(\alpha\), where \((x_a)_a\) is a converging sequence of points in \(M\), \((\mu_a)_a\) is a sequence of positive real numbers converging to 0, and \(\Lambda \in S^{p-1}_+\). The \(x_a\)’s are the centers of the bubble, the \(\mu_a\)’s are the weights of the bubble, and \(\Lambda\) is the \(S^{p-1}_+\)-projection of the bubble.

The right-hand side in (4-2) can be seen as the Riemannian extension of the right-hand side in (3-2). At last we let \(u_0 : \mathbb{R}^n \to \mathbb{R}\) be the function given by

\[
u_0(x) = \left(1 + \frac{|x|^2}{n(n-2)}\right)^{-(n-2)/2}
\]

for all \(x \in \mathbb{R}^n\). Another possible definition of \(u_0\) is that it is the unique nonnegative solution of \(\Delta u = u^{2^* - 1}\) which achieves its maximum at 0 and which is such that \(u_0(0) = 1\). The result we prove in this section provides a complete description of the blow-up in Sobolev spaces and very useful pointwise estimates.

**Proposition 4.2.** Let \((M, g)\) be a smooth compact Riemannian manifold of dimension \(n \geq 3\), \(p \geq 1\) be an integer, and \((A_\alpha)_\alpha\) be a sequence of \(C^1\) maps from \(M\) to \(M^p_\mathbb{R}(\mathbb{R})\) such that \(A_\alpha \to A\) in \(C^1(M)\) as \(\alpha \to +\infty\) for some \(C^1\) map \(A\) from \(M\) to \(M^p_\mathbb{R}(\mathbb{R})\). Let also \((\mathcal{U}_\alpha)_\alpha\) be an arbitrary bounded sequence in \(H^1(M)\) of nonnegative solutions of (1-1) such that \(\|\mathcal{U}_\alpha\|_\infty \to +\infty\) as \(\alpha \to +\infty\). Then there exist \(N \in \mathbb{N}^*, \) a nonnegative solution \(U_\infty\) of (0-1), and vector bubbles \((\mathcal{B}_\alpha^i)_\alpha\) as in (4-2) for \(i = 1, \ldots, N\), such that, up to a subsequence,

\[
\mathcal{U}_\alpha = \mathcal{U}_\infty + \sum_{i=1}^N \mathcal{B}_\alpha^i + \mathcal{B}_\alpha
\]

for all \(\alpha\),

\[
\int_M |\mathcal{U}_\alpha|^2 dv_g = \int_M |\mathcal{U}_\infty|^2 dv_g + NK_n^{-n} + o(1) \quad \text{for all } \alpha, \text{ and}
\]

\[
\mathcal{D}_\alpha^{(n-2)/2} \left|\mathcal{U}_\alpha - \mathcal{U}_\infty - \sum_{i=1}^N \mathcal{B}_\alpha^i\right| \to 0 \quad \text{in } L^\infty(M) \quad \text{as } \alpha \to +\infty,
\]

where \(\mathcal{B}_\alpha \to 0\) in \(H^1(M)\) as \(\alpha \to +\infty\), \(o(1) \to 0\) as \(\alpha \to +\infty\), \(K_n\) is as in (3-8), \(\mathcal{D}_\alpha : M \to \mathbb{R}^+\) is given by

\[
\mathcal{D}_\alpha(x) = \min_{i=1, \ldots, N} \left(d_g(x_{i, \alpha}, x) + \mu_{i, \alpha}\right),
\]

and the \(x_{i, \alpha}\)’s and \(\mu_{i, \alpha}\)’s are the centers and weights of the vector bubbles \((\mathcal{B}_\alpha^i)_\alpha\). Moreover, as \(\alpha \to +\infty\),

\[
\frac{d_g(x_{i, \alpha}, x_{j, \alpha})^2}{\mu_{i, \alpha} \mu_{j, \alpha}} + \frac{\mu_{i, \alpha}}{\mu_{j, \alpha}} + \frac{\mu_{j, \alpha}}{\mu_{i, \alpha}} \to +\infty \quad \text{for all } i \neq j \quad \text{and}
\]

\[
\hat{\mathcal{R}}^\mu_{x_{i, \alpha}, \alpha} \to u_0 \Lambda_i \text{ in } C^2_{\text{loc}}(\mathbb{R}^n \setminus \{f_i\}) \quad \text{for all } i,
\]

where \(\hat{\mathcal{R}}^\mu_{x_{i, \alpha}, \alpha}\) is the \(\mu\)-vector bubble centered at \(x_{i, \alpha}\).
where the $\hat{R}_x^{\mu_a}$-rescaling procedure is defined in (4-1), $u_0$ is as in (4-3), the $\Lambda_i$’s are the $S^{p-1}$-projections of the $(\mathcal{R}_i^a)$’s,

$$\mathcal{F}_i = \left\{ \lim_{\alpha \to +\infty} \mu_i^{-1} \exp_{x_i,a}^{-1}(x_j,a), j \in I_i \right\},$$

the limits in the definition of $\mathcal{F}_i$ are as $\alpha \to +\infty$, and $I_i$ consists of the $j$’s such that $d_g(x_i,a, x_j, a) = O(\mu_i,a)$ and $\mu_j,a = o(\mu_i,a)$ for all $\alpha$.

**Proof.** Let $I_a$ be the free functionals associated with (0-1). They are defined for $\mathcal{U} \in H^1(M)$ by

$$I_a(\mathcal{U}) = \frac{1}{2} \int_M (|\nabla \mathcal{U}|^2 + A_a(\mathcal{U}, \mathcal{U})) \, dv_g - \frac{1}{2} \int_M |\mathcal{U}|^2 \, dv_g.$$  

The $\mathcal{U}_a$’s in Proposition 4.2 solve (0-1) and are bounded in $H^1$. In particular, $(\mathcal{U}_a)_a$ is a Palais–Smale sequence for the $I_a$’s in the sense that the sequence $(I_a(\mathcal{U}_a))_a$ is bounded and $DI_a(\mathcal{U}_a) \to 0$ in $H^1(M)$ as $\alpha \to +\infty$. Let $\eta$ be a smooth cutoff function in $\mathbb{R}^n$ with small support around 0. Mimicking the proof in [Struwe 1984] (see also [Druet et al. 2004] for its Riemannian analogue), we get that there exist $N \in \mathbb{N}^*$, a nonnegative solution $U_\infty$ of (0-1), converging sequences $(x_i,a)$ in $M$, sequences $(\mu_i,a)_a$ of positive real numbers converging to 0, and nonnegative solutions $\mathcal{U}_i \in H^1(\mathbb{R}^n)$ of (3-1) in $\mathbb{R}^n$, $i = 1, \ldots, N$, such that, up to a subsequence, the first equation in (4-5) holds true, such that

$$\mathcal{U}_a = \mathcal{U}_\infty + \sum_{i=1}^N \eta_i^a \hat{R}_x^{\mu_i,a} \mathcal{U}_i + \mathcal{R}_a \quad (4-6)$$

for all $\alpha$, and such that

$$\int_M |\mathcal{U}_a|^2 \, dv_g = \int_M |\mathcal{U}_\infty|^2 \, dv_g + \sum_{i=1}^N \int_{\mathbb{R}^n} |\mathcal{U}_i|^2 \, dx + o(1) \quad (4-7)$$

for all $\alpha$, where $\eta_i^a(x) = \eta(\exp_{x_i,a}^{-1}(x))$, the $\hat{R}_x^{\mu_i,a}$-rescalings are defined in (4-1), $\mathcal{R}_a \to 0$ in $H^1(M)$ as $\alpha \to +\infty$, and $o(1) \to 0$ as $\alpha \to +\infty$. By Proposition 3.1,

$$\mathcal{U}_i(x) = \left( \frac{\lambda_i}{\lambda_i^2 + |x-a_i| n(n-2)} \right)^{(a-2)/2} \Lambda_i \quad (4-8)$$

for some $a_i \in \mathbb{R}^n$, $\lambda_i > 0$, $\Lambda_i \in S^{p-1}_+$, and all $x \in \mathbb{R}^n$. Up to changing the $x_i,a$’s and $\mu_i,a$’s, letting $\tilde{x}_i,a = \exp_{x_i,a}(\mu_i,a a_i)$ and $\tilde{\mu}_i,a = \lambda_i \mu_i,a$, we can write, as in [Druet and Hebey 2005b], that

$$\eta_i^a \hat{R}_x^{\tilde{\mu}_i,a} \mathcal{U}_i = \mathcal{R}_a + \mathcal{R}_a \quad (4-9)$$

for all $\alpha$, where $\mathcal{U}_i$ is as in (4-8), $\mathcal{R}_a \to 0$ in $H^1(M)$ as $\alpha \to +\infty$, and $(\mathcal{R}_a)_a$ is the vector bubble with center $\tilde{x}_i,a$, weight $\tilde{\mu}_i,a$, and $S^{p-1}$-projection $\Lambda_i$. Noting that the changes $x_i,a \to \tilde{x}_i,a$ and $\mu_i,a \to \tilde{\mu}_i,a$ do not affect the first equation in (4-5), it follows from the above discussion, from (3-9), and from (4-6), (4-7), and (4-9), that the two first equations in (4-4) and the first equation in (4-5) hold true. Now we forget about the tilde notation for the centers and weights of the bubbles and, for $i = 1, \ldots, N$, we let
$\mathcal{S}_i$ be as in Proposition 4.2. As one can check from the first equations in (4-4) and (4-5), for any $i$,

$$
\hat{R}_{x_i,\alpha}^{\mu_i,\alpha} \sum_{j=1}^{N} B^j_{\alpha} \to u_0 \Lambda_i \text{ in } L^\infty_{\text{loc}}(\mathbb{R}^n \setminus \mathcal{S}_i) \quad \text{and} \quad \hat{R}_{x_i,\alpha}^{\mu_i,\alpha} u_\alpha - \hat{R}_{x_i,\alpha}^{\mu_i,\alpha} \sum_{j=1}^{N} B^j_{\alpha} \to 0 \text{ in } L^2_{\text{loc}}(\mathbb{R}^n)
$$

(4-10)
as $\alpha \to +\infty$, where the $\hat{R}_{x_i,\alpha}^{\mu_i,\alpha}$-rescalings are defined in (4-1), $\Lambda_i$ is the $S^{n-1}$-projection of $(B^j_{\alpha})_{\alpha}$, and $u_0$ is as in (4-3). Moreover, in any compact subset of $\mathbb{R}^n$, and for $\alpha$ sufficiently large,

$$
\Delta_{g_\alpha} \tilde{u}_{i,\alpha} + \mu_{i,\alpha}^2 \sum_{j=1}^{p} \tilde{A}_{ij}^{\alpha}(x) \tilde{u}_{j,\alpha} = |\tilde{u}_{\alpha}|^{2^*-2} \tilde{u}_{i,\alpha}
$$

(4-11)
for all $\alpha$ and all $i$, where the $\tilde{u}_{i,\alpha}$’s are the components of $\tilde{u}_\alpha = \hat{R}_{x_i,\alpha}^{\mu_i,\alpha} u_\alpha$,

$$
\tilde{A}_{ij}^{\alpha}(x) = A_{ij}^{\alpha}(\exp_{x_i,\alpha}(\mu_{i,\alpha} x)),
$$

and $g_\alpha$ is the Riemannian metric in $\mathbb{R}^n$ given by $g_\alpha(x) = (\exp_{x_i,\alpha}^\prime, \exp_{x_i,\alpha})(\mu_{i,\alpha} x)$. Since $\mu_{i,\alpha} \to 0$ as $\alpha \to +\infty$, we get that $g_\alpha \to \tilde{g}$ in $C^2_{\text{loc}}(\mathbb{R}^n)$ as $\alpha \to +\infty$, where $\tilde{g}$ is the Euclidean metric. By (4-10), for any $x \in \mathbb{R}^n \setminus \mathcal{S}_i$,

$$
\lim_{\delta \to 0} \limsup_{\alpha \to +\infty} \int_{B_{\delta}(x)} |\hat{R}_{x_i,\alpha}^{\mu_i,\alpha} u_\alpha|^{2^*} dx = 0.
$$

(4-12)
In particular, the $L^{2^*}$-norm of $\hat{R}_{x_i,\alpha}^{\mu_i,\alpha} u_\alpha$ can be made uniformly arbitrarily small in small regions of $\mathbb{R}^n \setminus \mathcal{S}_i$, and by adapting and transposing the classical regularity argument [Trudinger 1968] to the present situation (see also [Struwe 1990]) we get from (4-11) and (4-12) that the $\tilde{u}_\alpha$’s are uniformly bounded in $C^2_{\text{loc}}(\mathbb{R}^n \setminus \mathcal{S}_i)$. It easily follows that, up to a subsequence, the second equation in (4-5) also holds true. Now it remains to prove that the third equation in (4-4) holds true. We proceed by contradiction and assume that there exists $\varepsilon_0 > 0$ and a sequence $(x_\alpha)_{\alpha}$ in $M$ such that, up to a subsequence,

$$
\mathcal{D}_\alpha(x_\alpha)^2 |u_\alpha(x_\alpha) - u_\infty(x_\alpha) - \sum_{i=1}^{N} B^i_{\alpha}(x_\alpha)|^{2^*-2} = \max_M \mathcal{D}_\alpha^2 |u_\alpha - u_\infty - \sum_{i=1}^{N} B^i_{\alpha}|^{2^*-2} \geq 4\varepsilon_0
$$

(4-13)
for all $\alpha$. First we claim that

$$
\mathcal{D}_\alpha(x_\alpha)^2 |B^i_{\alpha}(x_\alpha)|^{2^*-2} \to 0
$$

(4-14)
as $\alpha \to +\infty$, for all $i = 1, \ldots, N$. In order to prove (4-14) we proceed by contradiction and assume that there exists $i = 1, \ldots, N$ and $\varepsilon_1 > 0$ such that, up to a subsequence,

$$
\mathcal{D}_\alpha(x_\alpha)^2 |B^i_{\alpha}(x_\alpha)|^{2^*-2} \geq \varepsilon_1
$$

(4-15)
for all $\alpha$. Up to passing to another subsequence we may then assume that there is $\lambda \in [0, +\infty)$ such that

$$
\frac{d_{g_\alpha}(x_{i,\alpha}, x_{\alpha})}{\mu_{i,\alpha}} \to \lambda \text{ as } \alpha \to +\infty, \quad \text{and} \quad \frac{\mu_{j,\alpha}}{\mu_{i,\alpha}} + \frac{d_{g_\alpha}(x_{j,\alpha}, x_{\alpha})}{\mu_{i,\alpha}} \geq \sqrt{\varepsilon_1} \text{ for all } \alpha \text{ and } j.
$$

(4-16)
Then, letting $y_\alpha = \mu_{i,\alpha}^{-1} \exp_{x_{i,\alpha}}^{-1}(x_{\alpha})$, we get from the second equation in (4-16) that there exists $\varepsilon > 0$ such that $d(y_\alpha, \mathcal{S}_i) \geq \varepsilon$ for all $\alpha$, and it follows from the second equation in (4-5) that

$$
\mathcal{D}_\alpha(x_\alpha)^2 |u_\alpha(x_\alpha) - u_\infty(x_\alpha) - B^i_{\alpha}(x_\alpha)|^{2^*-2} \to 0 \quad \text{as } \alpha \to +\infty.
$$

(4-17)
By the first equation in (4-5), and by (4-16), we can also write
\[
\mathcal{D}_a (x_a) ^2 |\mathcal{B}^j_a (x_a) | ^{2^*-2} \to 0
\]  
(4-18)
as \alpha \to +\infty$, for all $j \neq i$. Combining (4-17) and (4-18) we get a contradiction with (4-13). It follows that (4-14) holds true. Next we claim that
\[
|\mathcal{U}_a (x_a) | \to +\infty \quad \text{as} \quad \alpha \to +\infty.
\]  
(4-19)
By (4-13) and (4-14), we see that (4-19) holds if $\mathcal{D}_a (x_a) \to 0$ as $\alpha \to +\infty$. Suppose on the contrary that, up to a subsequence, $\mathcal{D}_a (x_a) \to \delta$ as $\alpha \to +\infty$ for some $\delta > 0$. Then, by (4-13) and (4-14),
\[
|\mathcal{U}_a (x) - \mathcal{U}_\infty (x) | ^{2^*-2} + o(1) \leq 8 |\mathcal{U}_a (x_a) - \mathcal{U}_\infty (x_a) | ^{2^*-2} + o(1)
\]  
(4-20)
for all $x \in B_{x_a} (\delta/2)$ and all $\alpha$ sufficiently large. Now, if we assume that (4-19) is false, then we get from (4-20) that the $\mathcal{U}_a$'s are bounded in a neighbourhood of the $x_a$'s, and it follows from standard elliptic theory that $\mathcal{U}_a (x_a) - \mathcal{U}_\infty (x_a) \to 0$ as $\alpha \to +\infty$. Noting that this convergence of the $(\mathcal{U}_a - \mathcal{U}_\infty) (x_a)$'s is in contradiction with (4-13) and (4-14), we obtain (4-19).

Now let the $\mu_a$'s be given by $\mu_a ^{1/(n/2)} = |\mathcal{U}_a (x_a) |$ for all $\alpha$, and define the $\mathcal{V}_a$'s by $\mathcal{V}_a = \tilde{R}_{x_a} ^{\mu_a} \mathcal{U}_a$, where the $\tilde{R}_{x_a} ^{\mu_a}$-rescalings are defined in (4-1). Then,
\[
\Delta_{g_a} v_{i,a} + \mu_a ^2 \sum _{j=1} ^p \hat{A}_{ij} ^a (x) v_{j,a} = |\mathcal{V}_a | ^{2^*-2} v_{i,a}
\]  
(4-21)
in $B_0 (\delta/\mu_a)$ for all $\alpha$, where the $v_{i,a}$'s are the components of $\mathcal{V}_a$, the $\hat{A}_{ij} ^a$'s are given by $\hat{A}_{ij} ^a (x) = A_{ij} ^a (\exp _{x_a} (\mu_a x))$, and $g_a$ is given by $g_a (x) = (\exp _{x_a} ^* g) (\mu_a x)$. From (4-19) we have $\mu_a \to 0$ as $\alpha \to +\infty$.

In particular, $g_a \to \zeta$ in $C^2 _{\text{loc}} (\mathbb{R}^n)$ as $\alpha \to +\infty$. We also have $|\mathcal{V}_a (0) | = 1$ for all $\alpha$. Noting that the $\mathcal{V}_a$'s are bounded in $H^1 (\mathbb{R}^n)$, we may assume that, up to a subsequence, $\mathcal{V}_a \to \mathcal{V}_\infty$ weakly in $H^1 _{\text{loc}} (\mathbb{R}^n)$ as $\alpha \to +\infty$ for some $\mathcal{V}_\infty \in H^1 (\mathbb{R}^n)$ that solves (3-1). Let $\tilde{J}$ be given by
\[
\tilde{J} = \left\{ \lim _{\alpha \to +\infty} \frac{1}{\mu_a} \exp _{x_a} ^{-1} (x_{i,a}) : i \in J \right\},
\]  
where $J$ consists of the $i = 1, \ldots, N$ which are such that $d_g (x_{i,a}, x_a) = O (\mu_a)$ and $\mu_a, \alpha = o (\mu_a)$ for all $\alpha$. In what follows we let $K \subseteq \mathbb{R}^n \setminus \tilde{J}$ be a compact subset of $\mathbb{R}^n \setminus \tilde{J}$, and let $x \in K$. By (4-13) and (4-14) we have
\[
|\mathcal{V}_a (x) - \mu_a ^{(n-2)/2} \mathcal{U}_\infty (y_a) - \mu_a ^{(n-2)/2} \sum _{i=1} ^N \Lambda _i B_i,a (y_a) | ^{2^*-2} \leq \left( \frac{\mathcal{D}_a (x_a) }{\mathcal{D}_a (y_a) } \right) ^2 (1 + o(1)) + o(1),
\]  
(4-22)
where $y_a = \exp _{x_a} (\mu_a x)$ for all $\alpha$, $\Lambda _i$ is the $S^p_1$-projection of $(\mathcal{B}_a ^i)_a$ for all $i$, and $B_i,a = |\mathcal{B}_a ^i |_a$ for all $\alpha$ and $i$. Now we claim that
\[
\mu_a ^{(n-2)/2} |B_i,a (y_a) | \to 0
\]  
(4-23)
as $\alpha \to +\infty$, for all $i = 1, \ldots, N$. Equation (4-23) is obvious if $\mu_a = o (\mu_a)$. On the other hand, if we assume that $\mu_a = o (\mu_a)$, then, since $d_g (x, \tilde{J}) > 0$, we get $\mu_a = O (d_g (x_{i,a}, y_a))$. Here again, (4-23) holds true. At last we may assume that there exists $C > 0$ such that $C^{-1} \mu_a \leq \mu_{i,a} \leq C \mu_a$ for all $\alpha$. 

Then (4-23) holds true unless \( d_g(x_{i,a}, y_a) = O(\mu_{i,a}) \). In this case we have \( d_g(x_{i,a}, x_a) = O(\mu_{i,a}) \), and it follows that \(|B_i(x_a)|/|\|u_a(x_a)\|_0\) → 0 as \( \alpha \to +\infty \). Combining (4-13) and (4-14) we get a contradiction, and it follows that (4-23) holds true. In particular, by (4-19), (4-22), and (4-23), we can write

\[
|V_a(x)|^{2^* - 2} \leq \left( \frac{\partial_a(x_a)}{\tilde{D}_a(y_a)} \right)^2 (1 + o(1)) + o(1).
\]  

(4-24)

At this point we claim that

\[
\tilde{D}_a(x_a) = O(\tilde{D}_a(y_a)).
\]  

(4-25)

We prove (4-25) by contradiction and assume that

\[
d_g(x_{i,a}, y_a) + \mu_{i,a} = o(\tilde{D}_a(x_a)).
\]  

(4-26)

If \( d_g(x_{i,a}, x_a)/\mu_a \to +\infty \) as \( \alpha \to +\infty \), then

\[
d_g(x_{i,a}, y_a) + \mu_{i,a} \geq (1 + o(1))d_g(x_{i,a}, x_a) + \mu_{i,a} \geq (1 + o(1))\tilde{D}_a(x_a),
\]  

and this contradicts (4-26). Hence, \( d_g(x_{i,a}, x_a) = O(\mu_a) \). Then, by (4-26),

\[
d_g(x_{i,a}, y_a) + \mu_{i,a} = o(\mu_a) + o(\mu_{i,a}).
\]  

(4-27)

In particular, \( d_g(x_{i,a}, y_a) = o(\mu_a) \). Since \( x \in K \), this implies in turn that \( \mu_a = O(\mu_{i,a}) \), and we get with (4-27) that \( \mu_{i,a} + o(\mu_{i,a}) = 0 \), another contradiction. This proves (4-25). By (4-24) and (4-25), for any compact subset \( K \subseteq \mathbb{R}^n \setminus \tilde{F} \), there exists \( C_K > 0 \) such that \( |V_a| \leq C_K \) in \( K \). In particular, by standard elliptic theory and (4-21), we get

\[
\forall \alpha \to \forall_{\infty} \text{ in } C^2_{\text{loc}}(\mathbb{R}^n \setminus \tilde{F}) \quad \text{as } \alpha \to +\infty.
\]  

(4-28)

Clearly \( 0 \not\in \tilde{F} \) since, if not the case, \( \tilde{D}_a(x_a) = o(\mu_a) \) and we get a contradiction with (4-13). Thus, since \( |V_a(0)| = 1 \) for all \( \alpha \), we see that \( |V_{\infty}(0)| = 1 \) and \( V_{\infty} \not\equiv 0 \) is not identically zero. By Proposition 3.1 it follows that there exists \( a \in \mathbb{R}^n \), \( \lambda > 0 \), and \( \Lambda \in S^n_{++} \), such that

\[
V_{\infty}(x) = \left( \frac{\lambda}{\lambda^2 + \frac{|x-a|}{n(n-2)}} \right)^{(n-2)/2} \Lambda
\]  

(4-29)

for all \( x \in \mathbb{R}^n \). Let \( K \subseteq \mathbb{R}^n \setminus \tilde{F} \) be a nonempty compact subset of \( \mathbb{R}^n \setminus \tilde{F} \). By the first equation in (4-4) and by (4-23), we can write \( V_{\alpha} \to 0 \) in \( L^2(K) \) as \( \alpha \to +\infty \). Then, by (4-28), we get \( \int_K |V_{\infty}|^2 \ dx = 0 \), a contradiction with (4-29). Proposition 4.2 is proved.

\[\square\]

5. A first strong pointwise estimate

We prove pointwise estimates on the \( \forall_{a} \)'s which we use as the initial step in the induction argument we develop in the next section. First we fix some notations. We let \( \forall_{a} \) be an arbitrary bounded sequence in \( H^1(M) \) of nonnegative solutions of (1-1) such that \( \|\forall_{a}\|_{\infty} \to +\infty \) as \( \alpha \to +\infty \). Proposition 4.2 applies to the \( \forall_{a} \)’s. We let \( \tilde{F} \) be the set of the geometrical points of the \( \forall_{a} \)’s. Then,

\[
\tilde{F} = \left\{ \lim_{\alpha \to +\infty} x_{i,a} : i = 1, \ldots, N \right\},
\]  

(5-1)
where all the limits do exist, up to a subsequence. For $\delta > 0$ small enough, we let
\[
\eta_\delta(\delta) = \max_{M \setminus \bigcup_{i=1}^N B_{\eta_\delta}(\delta)} |u_\alpha|.
\]

Thanks to the last equation in (4-4) of Proposition 4.2
\[
\limsup_{\alpha \to +\infty} \eta_\delta(\delta) \leq \|u_\infty\|_\infty.
\]

Moreover, by standard elliptic theory, for any $\delta' > \delta$,
\[
\max_{M \setminus \bigcup_{i=1}^N B_{\eta_\delta}(\delta')} |\nabla u_\alpha|_g = O(\eta_\delta(\delta)).
\]

In what follows we let $R_0 > 0$ be such that for any $i = 1, \ldots, N$,
\[
|x| \leq \frac{R_0}{2}
\]
for all $x \in \mathcal{F}_i$, where $\mathcal{F}_i$ is as in Proposition 4.2. We also set
\[
\mu_\alpha = \max_{i \in \{1, \ldots, N\}} \mu_{i, \alpha}, \quad \text{and} \quad r_\alpha(x) = \min_{i \in \{1, \ldots, N\}} d_g(x_{i, \alpha}, x).
\]

The pointwise estimate we prove in this section is stated as follows.

**Proposition 5.1.** Let $(M, g)$ be a smooth compact Riemannian manifold of dimension $n \geq 3$, $p \geq 1$ be an integer, and $(A_{\alpha})_{\alpha}$ be a sequence of $C^1$ maps from $M$ to $M^p_0(\mathbb{R})$ such that $A_{\alpha} \to A$ in $C^1(M)$ as $\alpha \to +\infty$ for some $C^1$ map $A$ from $M$ to $M^p_0(\mathbb{R})$ satisfying (H). Let also $(\mathcal{U}_{\alpha})_{\alpha}$ be an arbitrary bounded sequence in $H^1(M)$ of nonnegative solutions of (1-1) such that $\|\mathcal{U}_{\alpha}\|_\infty \to +\infty$ as $\alpha \to +\infty$. There exists $C_1 > 0$ such that, up to passing to a subsequence on the $\mathcal{U}_{\alpha}$’s, there holds that for any sequence $(x_{\alpha})_{\alpha}$ of points in $M$,
\[
|\mathcal{U}_{\alpha}(x_{\alpha}) - \mathcal{U}_{\infty}(x_{\alpha})| \leq \nu_{\alpha}^{(n-2)/2}D_{\alpha}(x_{\alpha})^{2-n} + \nu_{\alpha}\|\mathcal{U}_{\infty}\|_\infty,
\]
\[
\text{where } D_{\alpha} \text{ and } \mathcal{U}_{\infty} \text{ are as in Proposition 4.2, } \mu_{\alpha} \text{ is as in (5-6), and } \nu_{\alpha} \to 0 \text{ as } \alpha \to +\infty.
\]

We divide the proof of Proposition 5.1 into two steps.

**Step 1.** For any $0 < \varepsilon < \frac{1}{2}$, there exist $R_\varepsilon > 0$, $\delta_\varepsilon > 0$ and $C_\varepsilon > 0$ such that
\[
|\mathcal{U}_{\alpha}(x)| \leq C_\varepsilon \left(\mu_{\alpha}^{(1-2\varepsilon)(n-2)/2}r_\varepsilon(x)^{(2-n)(1-\varepsilon)} + \eta_\varepsilon(\delta_\varepsilon)r_\alpha(x)^{(2-n)\varepsilon}\right)
\]
for all $\alpha$ and all $x \in M \setminus \bigcup_{i=1}^N B_{\eta_\delta}(R_\varepsilon \mu_{i, \alpha})$.

**Proof of Step 1.** Let $0 < \varepsilon < \frac{1}{2}$. Consider $g$ the Green’s function of the operator $u \mapsto \Delta_g u + u$. We know (see [Druet et al. 2004], for example) that there exist $\gamma_1 > 1$, $\gamma_2 > 0$ and $\gamma_3 > 0$ such that for any distinct $x, y \in M$,
\[
\frac{1}{\gamma_1} \leq d_g(x, y)^{n-2}g(x, y) \leq \gamma_1
\]
and
\[
|\nabla g(x, y)|^2 \geq \gamma_2 d_g(x, y)^{-2} - \gamma_3,
\]
\[
\frac{1}{\gamma_1} \leq d_g(x, y)^{n-2}g(x, y) \leq \gamma_1
\]
and
\[
|\nabla g(x, y)|^2 \geq \gamma_2 d_g(x, y)^{-2} - \gamma_3,
\]
where $\nabla$ in (5-9) is with respect to one of the two variables, for instance $y$. We let

$$
\Psi_{a,\epsilon}(x) = \mu_a^{(1-2\epsilon)(n-2)/2} \sum_{i=1}^{N} g(x_{i,a}, x)^{1-\epsilon} + \eta_a(\delta) \sum_{i=1}^{N} g(x_{i,a}, x)^{\epsilon},
$$

and let $y_a \in M \setminus \bigcup_{i=1}^{N} B_{xi,a}(R\mu_i,a)$ be such that

$$
\max_{M \setminus \bigcup_{i=1}^{p} B_{xi,a}(R\mu_i,a)} \frac{\sum_{i=1}^{p} u_{i,a}}{\Psi_{a,\epsilon}}(y_a) = \frac{\sum_{i=1}^{N} u_{i,a}}{\Psi_{a,\epsilon}}(y_a)
$$

for all $\alpha$. We claim that, if $\delta > 0$ is chosen sufficiently small and $R > 0$ sufficiently large, then

$$
y_a \in \delta \left( M \setminus \bigcup_{i=1}^{N} B_{xi,a}(R\mu_i,a) \right) \quad \text{or} \quad r_a(y_a) > \delta
$$

for $\alpha$ large. We prove the claim by contradiction. Indeed, assume that (5-11) fails for all $\alpha$. We can write

$$
\frac{\Delta_g \left( \sum_{i=1}^{p} u_{i,a} \right)}{\sum_{i=1}^{p} u_{i,a}}(y_a) \geq \frac{\Delta_g \Psi_{a,\epsilon}}{\Psi_{a,\epsilon}}(y_a).
$$

Thanks to (1-1),

$$
\frac{\Delta_g \left( \sum_{i=1}^{p} u_{i,a} \right)}{\sum_{i=1}^{p} u_{i,a}}(y_a) \leq |\nabla u_a(y_a)|^{2\epsilon-2} + p\|A_a\|_{\infty},
$$

where $\|A_a\|_{\infty} = \max_{i,j} \|A_{ij}^{a}\|_{\infty}$ for all $\alpha$. By (5-12) we then get

$$
\frac{\Delta_g \Psi_{a,\epsilon}}{\Psi_{a,\epsilon}}(y_a) \leq |\nabla u_a(y_a)|^{2\epsilon-2} + p\|A_a\|_{\infty}.
$$

Since $r_a(y_a) \leq \delta$, this yields

$$
r_a(y_a)^2 \frac{\Delta_g \Psi_{a,\epsilon}}{\Psi_{a,\epsilon}}(y_a) \leq r_a(y_a)^2 |\nabla u_a(y_a)|^{2\epsilon-2} + \delta^2 p\|A\|_{\infty} + o(1).
$$

Now we write

$$
\Delta_g \Psi_{a,\epsilon}(y_a) = \epsilon(1-\epsilon) \mu_a^{(1-2\epsilon)(n-2)/2} \sum_{i=1}^{N} \left| \nabla g(x_{i,a}, y_a) \right|^2 g(x_{i,a}, y_a)^{1-\epsilon}
$$

$$
+ \epsilon(1-\epsilon) \eta_a(\delta) \sum_{i=1}^{N} \left| \nabla g(x_{i,a}, y_a) \right|^2 g(x_{i,a}, y_a)^{\epsilon}
$$

$$
- \epsilon \eta_a(\delta) \sum_{i=1}^{N} g(x_{i,a}, y_a)^{\epsilon} - (1-\epsilon) \mu_a^{(1-2\epsilon)(n-2)/2} \sum_{i=1}^{N} g(x_{i,a}, y_a)^{1-\epsilon}.
$$

Using (5-8) and (5-9), and since $0 < \epsilon < \frac{1}{2}$, it follows that

$$
\Delta_g \Psi_{a,\epsilon}(y_a)
$$

$$
\geq - (1-\epsilon) \Psi_{a,\epsilon}(y_a) - \gamma_3 \epsilon (1-\epsilon) \Psi_{a,\epsilon}(y_a) + \epsilon(1-\epsilon) \mu_a^{(1-2\epsilon)(n-2)/2} \sum_{i=1}^{N} d_g(x_{i,a}, y_a)^{-2} g(x_{i,a}, y_a)^{1-\epsilon}
$$

$$
+ \epsilon(1-\epsilon) \mu_a^{(1-2\epsilon)(n-2)/2} \eta_a(\delta) \sum_{i=1}^{N} d_g(x_{i,a}, y_a)^{-2} g(x_{i,a}, y_a)^{\epsilon}
$$

$$
\geq -(1-\epsilon)(1+\gamma_3 \epsilon) \Psi_{a,\epsilon}(y_a) + \epsilon(1-\epsilon) \mu_a^{(1-2\epsilon)(n-2)/2} \eta_a(\delta) \sum_{i=1}^{N} d_g(x_{i,a}, y_a)^{-2} g(x_{i,a}, y_a)^{-2(n-2)(1-\epsilon)}
$$

$$
+ \epsilon(1-\epsilon) \mu_a^{(1-2\epsilon)(n-2)/2} \eta_a(\delta) r_a(y_a)^{-2(n-2)\epsilon}.
$$
From (5-8) we obtain $\Psi_{a,\varepsilon}(y_a) \leq N\gamma_1^{1-\varepsilon} \mu_a^{(1-2\varepsilon)(n-2)/2} r_a(y_a)^{-(n-2)(1-\varepsilon)} + N\gamma_1^\varepsilon \eta_a(\delta) r_a(y_a)^{-(n-2)\varepsilon}$, and we can write
\[ r_a(y_a)^2 \Delta_g \Psi_{a,\varepsilon}(y_a) \geq -(1-\varepsilon)(1+\gamma_3\varepsilon) r_a(y_a)^2 \Psi_{a,\varepsilon}(y_a) + \frac{1}{N} (1-\varepsilon) \gamma_2 \gamma_1^{2(\varepsilon-1)} \Psi_{a,\varepsilon}(y_a). \]

Coming back to (5-13), we thus get
\[ \frac{1}{N} (1-\varepsilon) \gamma_2 \gamma_1^{2(\varepsilon-1)} \leq r_a(y_a)^2 |u_a(y_a)|^{2^*-2} + \delta^2 p \|A\|_\infty + o(1) + (1-\varepsilon)(1+\gamma_3\varepsilon)\delta^2, \]
since we assumed that $r_a(y_a) \leq \delta$. By the last equation in (4-4) of Proposition 4.2 we can choose $\delta > 0$ and $R > 0$ so as to get a contradiction. Thus (5-11) is proved. Up to choosing $R$ a little bit larger, we deduce from the second equation in (4-5) of Proposition 4.2, and the definitions of $\mu_a$ and $\eta_a(\delta)$, that there exists $C > 0$ such that
\[ \sup_{M \setminus \bigcup_{i=1}^N B_{r_i,a}(R\mu_{i,a})} \sum_{i=1}^p u_{i,a}(x) \leq C_{\varepsilon}. \]

Using (5-8), we obtain the existence of $\delta_{\varepsilon} > 0$, $R_{\varepsilon} > 0$ and $C_{\varepsilon} > 0$ such that
\[ \sum_{i=1}^p u_{i,a}(x) \leq C_{\varepsilon} \left( \mu_a^{(1-2\varepsilon)(n-2)/2} r_a(x)^{(2-n)(1-\varepsilon)} + \eta_a(\delta_{\varepsilon}) r_a(x)^{(2-n)\varepsilon} \right) \]
for all $\alpha$ and all $x \in M \setminus \bigcup_{i=1}^N B_{r_i,a}(R_{\varepsilon}\mu_{i,a})$. This proves Step 1. \qed

**Step 2.** There exists $C_0 > 0$ such that $|u_a(x)| \leq C_0 \left( \mu_a^{(n-2)/2} D_a(x)^{2-n} + \|u_\varepsilon\|_\infty \right)$ for all $\alpha$ and all $x \in M$.

**Proof of Step 2.** First we prove that there is $\delta > 0$ small such that for any sequence $(y_a)$ of points in $M$,
\[ \limsup_{\alpha \to +\infty} \frac{|u_a(y_a)|}{\mu_a^{(n-2)/2} D_a(y_a)^{2-n} + \eta_a(\delta)} < +\infty. \]

By the definition of $\eta_a(\delta)$, it is clear that (5-14) holds if $r_a(y_a) \geq \delta$. Now assume that $r_a(y_a) = O(\mu_a)$. Then $D_a(y_a) = O(\mu_a)$. We can use the last equation in (4-4) of Proposition 4.2 to obtain
\[ D_a(y_a)^2 \mu_a^{-1} |u_a(y_a)|^{2/n-2} = O \left( D_a(y_a)^2 \mu_a^{-1} + \left( \sum_{i=1}^N D_a(y_a)^2 \mu_a^{-1} + 1 + \frac{d_g(x_i,a,y_a)^2}{n(n-2)\mu_{i,a}^2} \right)^{-1} \right), \]

since $D_a(y_a) \leq d_g(x_i,a,y_a) + \mu_{i,a}$ for all $i \in \{1, \ldots, N\}$. In particular, (5-14) holds true also in this case. Thus we may assume from now on that
\[ r_a(y_a) \leq \delta \quad \text{and} \quad \frac{r_a(y_a)}{\mu_a} \to +\infty \quad \text{as} \quad \alpha \to +\infty. \]

We let $\lambda > 1$ be such that $\lambda p \|A\|_\infty \not\in S p(\Delta_g)$ and we let $G$ be the Green’s function of $\Delta_g - \lambda p \|A\|_\infty$. Here again, there exist $C_1 > 1$, $C_2 > 0$ and $C_3 > 0$ such that
\[ \frac{1}{C_1} d_g(x,y)^{2-n} - C_2 \leq G(x,y) \leq C_1 d_g(x,y)^{2-n} \]
and
\[ |\nabla G(x, y)| \leq C_3 d_g(x, y)^{1-n} \] (5-17)
for all \( x, y \in M, x \neq y \). We let \( x_0 \in \mathcal{S} \) such that \( d_g(y, x_0) \leq \delta + o(1) \); such an \( x_0 \) does exist thanks to (5-15). We choose \( \delta > 0 \) such that
\[ d_g(x, y) \geq 4\delta \] (5-18)
for all \( x, y \in \mathcal{S}, x \neq y \), and such that
\[ \delta \leq \frac{1}{4}(C_1 C_2)^{-1/(n-2)}, \] (5-19)
where \( C_1 \) and \( C_2 \) are as in (5-16). We write with Green’s representation formula that
\[
\sum_{i=1}^{p} u_{i,a}(y_a) = \int_{B_{y_0}(2\delta)} G(y_a, x) \left( \Delta_g \left( \sum_{i=1}^{p} u_{i,a} \right) - \lambda p \|A\|_\infty \sum_{i=1}^{p} u_{i,a} \right)(x) \, dv_g(x) \\
+ \int_{\partial B_{y_0}(2\delta)} G(y_a, x) \partial_v \left( \sum_{i=1}^{p} u_{i,a} \right)(x) \, d\sigma_g(x) - \int_{\partial B_{y_0}(2\delta)} \partial_v G(y_a, x) \left( \sum_{i=1}^{p} u_{i,a} \right)(x) \, d\sigma_g(x). \tag{5-20}
\]
Since \( \lambda > 1 \), we get with (1-1) that
\[ \Delta_g \left( \sum_{i=1}^{p} u_{i,a} \right) - \lambda p \|A\|_\infty \sum_{i=1}^{p} u_{i,a} \leq |u_a|^{2-n} \sum_{i=1}^{p} u_{i,a}. \]
We have \( G(y_a, x) \geq 0 \) in \( B_{y_0}(2\delta) \) for \( \alpha \) large, thanks to (5-16) and (5-19). Thus we can write
\[
\int_{B_{y_0}(2\delta)} G(y_a, x) \left( \Delta_g \left( \sum_{i=1}^{p} u_{i,a} \right) - \lambda p \|A\|_\infty \sum_{i=1}^{p} u_{i,a} \right)(x) \, dv_g(x)
\leq C_1 \int_{M} d_g(y_a, x)^{2-n} |u_a(x)|^{2-n} \sum_{i=1}^{p} u_{i,a}(x) \, dv_g(x). \tag{5-21}
\]
From (5-18), we also know that \( d_g(x_{i,a}, \partial B_{y_0}(2\delta)) \geq \delta \) for all \( i = 1, \ldots, N \) and for \( \alpha \) large so that we can control the boundary terms in (5-20) thanks to (5-4), (5-16) and (5-17). We thus obtain that
\[
|u_a(y_a)| = O(\eta_a(\delta)) + O\left( \int_{M} d_g(y_a, x)^{2-n} |u_a(x)|^{2-n} \, dv_g(x) \right). \tag{5-22}
\]
We fix \( 0 < \varepsilon < \frac{1}{n+2} \) and we let \( R_\varepsilon > 0, \delta_\varepsilon > 0 \) and \( C_\varepsilon > 0 \) be given by Step 1. We write
\[
\int_{M} d_g(y_a, x)^{2-n} |u_a(x)|^{2-n} \, dv_g(x)
\leq \int_{M_{\varepsilon, \varepsilon}} d_g(y_a, x)^{2-n} |u_a(x)|^{2-n} \, dv_g(x) + \sum_{i=1}^{p} \int_{B_{y_0}(R_\varepsilon \mu_a)} d_g(y_a, x)^{2-n} |u_a(x)|^{2-n} \, dv_g(x),
\]
where \( M_{\varepsilon, \varepsilon} = M \setminus \bigcup_{i=1}^{N} B_{y_0}(R_\varepsilon \mu_a) \). From (5-15) and Hölder’s inequalities we obtain
\[
\int_{B_{y_0}(R_\varepsilon \mu_a)} d_g(y_a, x)^{2-n} |u_a(x)|^{2-n} \, dv_g(x) = O\left( \mu_a^{(n-2)/2} d_g(x_{i,a}, y_a)^{2-n} \right)
\]
for all \( i \in \{1, \ldots, N\} \). Thus we get
\[
\int_M d_g(y_\alpha, x)^{2-n}|\varphi_{\alpha}(x)|^{2^n-1}dv_g(x)
\]
\[
\leq \int_{M_{a,\varepsilon}} d_g(y_\alpha, x)^{2-n}|\varphi_{\alpha}(x)|^{2^n-1}dv_g(x) + \mathcal{O} \left( \mu_a^{(n-2)/2} r_a(y_\alpha)^{2-n} \right). \tag{5-23}
\]

Using Step 1, we know that for any \( x \in M_{a,\varepsilon} \),
\[
|\varphi_{\alpha}(x)|^{2^n-1} \leq 2^{2^n-2} C_{\varepsilon}^{2^n-1} \left( \frac{\mu_a^{(1-2\varepsilon)(n+2)/2}}{r_a(y_\alpha)^{(n+2)(1-\varepsilon)}} + \frac{\eta_a(\varepsilon)^{2^n-1}}{r_a(y_\alpha)^{(n+2)\varepsilon}} \right)
\]
so that
\[
\int_{M_{a,\varepsilon}} d_g(y_\alpha, x)^{2-n}|\varphi_{\alpha}(x)|^{2^n-1}dv_g(x)
\]
\[
\leq 2^{2^n-2} C_{\varepsilon}^{2^n-1} \mu_a^{(1-2\varepsilon)(n+2)/2} \int_{M_{a,\varepsilon}} d_g(y_\alpha, x)^{2-n}r_a(y_\alpha)^{-(n+2)(1-\varepsilon)}dv_g(x)
\]
\[
+ 2^{2^n-2} C_{\varepsilon}^{2^n-1} \eta_a(\varepsilon)^{2^n-1} \int_{M_{a,\varepsilon}} d_g(y_\alpha, x)^{2-n}r_a(y_\alpha)^{-(n+2)\varepsilon}dv_g(x)
\]
\[
\leq 2^{2^n-2} C_{\varepsilon}^{2^n-1} \mu_a^{(1-2\varepsilon)(n+2)/2} \sum_{i=1}^N \int_{M \setminus B_{j,a}(R_c, \mu_a)} d_g(y_\alpha, x)^{2-n}d_g(x_{i,a}, x)^{-(n+2)(1-\varepsilon)}dv_g(x)
\]
\[
+ 2^{2^n-2} C_{\varepsilon}^{2^n-1} \eta_a(\varepsilon)^{2^n-1} \sum_{i=1}^N \int_{M \setminus B_{j,a}(R_c, \mu_a)} d_g(y_\alpha, x)^{2-n}d_g(x_{i,a}, x)^{-(n+2)\varepsilon}dv_g(x).
\]

From (5-15), straightforward computations yield
\[
\int_{M_{a,\varepsilon}} d_g(y_\alpha, x)^{2-n}|\varphi_{\alpha}(x)|^{2^n-1}dv_g(x) = \mathcal{O} \left( \mu_a^{(n-2)/2} r_a(y_\alpha)^{2-n} + \eta_a(\varepsilon)^{2^n-1} \right).
\]

Coming back to (5-23), using (5-3), we finally obtain that
\[
\int_M d_g(y_\alpha, x)^{2-n}|\varphi_{\alpha}(x)|^{2^n-1}dv_g(x) = \mathcal{O} \left( \mu_a^{(n-2)/2} r_a(y_\alpha)^{2-n} + \eta_a(\varepsilon)^{2^n-1} \right).
\]

Coming back to (5-22), taking \( 0 < \delta < \varepsilon \) such that (5-18) and (5-19) hold, we get (5-14) under assumption (5-15). In particular, if \( \delta \) is chosen sufficiently small, (5-14) holds. Now we claim that if \( \varphi_\infty \equiv 0 \), then
\[
\eta_a(\delta) = \mathcal{O} \left( \mu_a^{(n-2)/2} \right). \tag{5-24}
\]

As a consequence of (5-14), there exists \( C_0 > 0 \) such that in any compact subset \( K \) of \( M \setminus \mathcal{F} \),
\[
|\varphi_{\alpha}(x)| \leq C_0 \left( \mu_a^{(n-2)/2} C_K + \eta_a(\delta) \right)
\]
for some \( C_K > 0 \). If (5-24) were false, we would get by standard elliptic theory that
\[
\frac{\varphi_{\alpha}}{\eta_a(\delta)} \rightarrow H \text{ in } C_{\text{loc}}^2(M \setminus \mathcal{F}) \text{ as } a \rightarrow +\infty,
\]
where \( H \) satisfies \( \Delta_g H + AH = 0 \) in \( M \setminus \mathcal{I} \) and \( |H| \leq C_0 \) in \( M \setminus \mathcal{I} \). This implies that \( H \) is in the kernel of \( \Delta_g + A \). Since all the components of \( H \) are nonnegative and \( H \) is not identically zero by the definition of \( \eta_a(\delta) \), this would contradict assumption (H). In particular, (5-24) is proved. Noting that if \( \mathcal{U}_\infty \neq 0 \), then, by (5-3), \( \eta_a(\delta) = O(\|\mathcal{U}_\infty\|_{\infty}) \), we get with (5-14) that Step 2 holds true.

**Conclusion of the proof of Proposition 5.1.** If \( \mathcal{U}_\infty \equiv 0 \), the proposition is a direct consequence of Step 2. Assume now that \( \mathcal{U}_\infty \neq 0 \). We let \( \mathcal{H} \) be the Green’s function of the Laplacian on \( M \) normalized such that \( \mathcal{H}(x, y) \geq 1 \) for all \( x, y \in M, x \neq y \). There exists \( \Theta_1 > 1 \) such that

\[
\frac{1}{\Theta_1} d_g(x, y)^{2-n} \leq \mathcal{H}(x, y) \leq \Theta_1 d_g(x, y)^{2-n}
\]

(5-25) for all \( x, y \in M, x \neq y \). We let \((x_\alpha)\) be a sequence of points in \( M \) and prove that

\[
|\mathcal{U}_\alpha(x_\alpha) - \mathcal{U}_\infty(x_\alpha)| = O\left(\mu_\alpha^{(n-2)/2} \mathcal{D}_\alpha(x_\alpha)^{2-n}\right) + o(1).
\]

(5-26)

If \( \mathcal{D}_\alpha(x_\alpha) = O(\mu_\alpha) \), then (5-26) is a direct consequence of the last equation in (4-4) of Proposition 4.2. We may therefore assume that

\[
\frac{\mathcal{D}_\alpha(x_\alpha)}{\mu_\alpha} \to +\infty \quad \text{as} \quad \alpha \to +\infty.
\]

(5-27)

By standard elliptic theory,

\[
\mathcal{U}_\alpha \to \mathcal{U}_\infty \quad \text{in} \quad C^2_{\text{loc}}(M \setminus \mathcal{I}) \quad \text{as} \quad \alpha \to +\infty,
\]

(5-28)

where \( \mathcal{I} \) is as in (5-1). We write using Green’s representation formula that

\[
\sum_{i=1}^{p} u_{i,\alpha}(x_\alpha) - \sum_{i=1}^{p} u_{i,\infty}(x_\alpha) = \frac{1}{V_g} \sum_{i=1}^{p} \int_{M} (u_{i,\alpha}(x_\alpha) - u_{i,\infty}(x_\alpha)) \ dv_g
\]

\[
+ \sum_{i=1}^{p} \int_{M} \mathcal{H}(x_\alpha, x) \Delta_g(u_{i,\alpha} - u_{i,\infty})(x) \ dv_g(x),
\]

where \( V_g \) is the volume of \((M, g)\), and the \( u_{i,\infty} \)'s are the components of \( \mathcal{U}_\infty \). Then we get

\[
\sum_{i=1}^{p} u_{i,\alpha}(x_\alpha) - \sum_{i=1}^{p} u_{i,\infty}(x_\alpha) = \sum_{i=1}^{p} \int_{M} \mathcal{H}(x_\alpha, x) \Delta_g(u_{i,\alpha} - u_{i,\infty})(x) \ dv_g(x) + o(1).
\]

(5-29)

Thanks to (5-28) there exists \( \delta_\alpha > 0, \delta_\alpha \to 0 \) as \( \alpha \to +\infty \), such that, up to a subsequence,

\[
\|\mathcal{U}_\alpha - \mathcal{U}_\infty\|_{C^2(\mathcal{D}_\alpha > \delta_\alpha)} = o(1),
\]

(5-30)

where \( \|\mathcal{U}\|_{C^2} = \sum_{i=1}^{p} \|u_i\|_{C^2} \), and \( \{\mathcal{D}_\alpha > \delta_\alpha\} \) is the subset of \( M \) consisting of the \( x \in M \) such that \( \mathcal{D}_\alpha(x) > \delta_\alpha \). In particular, it follows from (5-25), (5-29) and (5-30) that

\[
\sum_{i=1}^{p} u_{i,\alpha}(x_\alpha) - \sum_{i=1}^{p} u_{i,\infty}(x_\alpha) = \sum_{i=1}^{p} \int_{\{\mathcal{D}_\alpha(x) \leq \delta_\alpha\}} \mathcal{H}(x_\alpha, x) \Delta_g u_{i,\alpha}(x) \ dv_g(x) + o(1).
\]

The proof of (5-26) then follows the lines of the proof of Step 2, using the estimate of that step. This ends the proof of Proposition 5.1. \( \square \)
6. Strong pointwise estimates and sharp asymptotics

We now turn to pointwise estimates and sharp asymptotics. Our main result in this section is this:

**Proposition 6.1.** Let \((M, g)\) be a smooth compact Riemannian manifold of dimension \(n \geq 3\), \(p \geq 1\) be an integer, and \((A_a)_a\) be a sequence of \(C^1\) maps from \(M\) to \(M^p_\rho(\mathbb{R})\) such that \(A_a \to A\) in \(C^1(M)\) as \(a \to +\infty\) for some \(C^1\) map \(A\) from \(M\) to \(M^p_\rho(\mathbb{R})\) satisfying (H). Let also \((\mathcal{U}_a)_a\) be an arbitrary bounded sequence in \(H^1(M)\) of nonnegative solutions of \((1-1)\) such that \(\|\mathcal{U}_a\|_\infty \to +\infty\) as \(a \to +\infty\). Up to passing to a subsequence on the \(\mathcal{U}_a\)'s, there holds that for any sequence \((x_a)_a\) of points in \(M\),

\[
\|\mathcal{U}_a(x_a) - \mathcal{U}_\infty(x_a) - \sum_{i=1}^N B_{i,a}(x_a) \Lambda_i \| = \epsilon_a \|\mathcal{U}_\infty\|_\infty + O\left(\mu_a^{(n-2)/2}\right) + o\left(\sum_{i=1}^N B_{i,a}(x_a)\right),
\]

where \(\mathcal{B}_i^a = B_{i,a} \Lambda_i\) for all \(a\) and all \(i\), where \(\mathcal{U}_\infty\), \(N\), and the \(\mathcal{B}_i^a\)'s are as in Proposition 4.2, where \(\epsilon_a \to 0\) as \(a \to +\infty\), and \(\mu_a = \max_i \mu_{i,a}\) is the maximum weight of the weights of the \(B_{i,a}\)'s as in (5-6).

We prove Proposition 6.1 in several steps, based on induction on the following statement, defined for \(1 \leq k \leq N+1\):

There exists \(C_k > 0\) such that, up to a subsequence on the \(\mathcal{U}_a\)'s, for any sequence \((x_a)_a\) of points in \(M\),

\[
\|\mathcal{U}_a(x_a) - \mathcal{U}_\infty(x_a) - \sum_{i=1}^{k-1} B_{i,a}(x_a) \Lambda_i \|
\leq C_k \left(\mu_a^{(n-2)/2} + \chi_k \mu_{k,a}^{(n-2)/2} R_{k,a}(x_a)^{2-n} + \epsilon_a \|\mathcal{U}_\infty\|_\infty + o\left(\sum_{i=1}^{k-1} B_{i,a}(x_a)\right)\right),
\]

where \(\epsilon_a \to 0\) as \(a \to +\infty\), \(\chi_k = 1\) if \(k \leq N\), and \(\chi_{N+1} = 0\).

Here we have reordered the blow-up points in such a way that \(\mu_a = \mu_{1,a} \geq \mu_{2,a} \geq \cdots \geq \mu_{N,a}\), and we have defined

\[
r_{i,a}(x) = \min_{i \leq j \leq N} d_s(x_{j,a}, x),
\]

\[
R_{i,a}(x) = \min_{i \leq j \leq N} \left(d_g(x_{j,a}, x) + \mu_{j,a}\right).
\]

We have \(R_{1,a}(x) = D_{a}(x)\) and \(r_{1,a}(x) = r_{a}(x)\), where \(D_{a}\) is as in Proposition 4.2 and \(r_{a}\) is as in (5-6).

We will refer to the whole indented statement above as \((\mathcal{F}_k)\), as well as the inequality so labeled. Clearly, Proposition 6.1 is equivalent to \((\mathcal{F}_{N+1})\), while Proposition 5.1 implies \((\mathcal{F}_1)\).

We apply induction on \(k\) to pass from \((\mathcal{F}_1)\) to \((\mathcal{F}_N)\), and then we use a slightly distinct argument to pass from \((\mathcal{F}_N)\) to \((\mathcal{F}_{N+1})\). In the following, we fix \(1 \leq \kappa \leq N-1\) and assume that \((\mathcal{F}_\kappa)\) holds true. We proceed in several steps, but first we fix some notation. As in the preceding section we let \(g\) be the Green’s function of the operator \(u \mapsto \Delta_g u + u\). Then (5-8) and (5-9) hold. We fix \(0 < \epsilon < 1/(n+2)\) and fix \(R_0\) as in (5-5). For any \(1 \leq i \leq \kappa\), we define

\[
\Phi^\epsilon_{i,a}(x) = \min\left\{\mu_{i,a}^{(1-2\epsilon)(n-2)/2} g(x_{i,a}, x)^{1-\epsilon}; D_0 \mu_{i,a}^{(1-2\epsilon)(n-2)/2} g(x_{i,a}, x)^\epsilon\right\},
\]

where \(x \in M \setminus \{x_{i,a}\}\),

\[
D_0 = \gamma_1^{2\epsilon-1}(4R_0)^{(2-n)(1-2\epsilon)},
\]
We also set
\[ \Phi_{i,a}^e(x) = D_0 \mu_{i,a}^{-(1-2\varepsilon)(n-2)/2} \phi(x_i, x)^e, \]
if \( d_g(x_i, x) \leq 2R_0 \mu_{i,a} \). We also let
\[ \varphi_{a}^e(x) = \max \left\{ \|u_{x_i}\|_{p} ; \mu_{a}^{(1-2\varepsilon)(n-2)/2} \right\} \sum_{i=1}^{N} \phi(x_i, x)^e \]
and
\[ \Psi_{a}^e(x) = \sum_{i=\kappa+1}^{N} \phi(x_i, x)^{1-e}. \]
For \( 1 \leq i \leq \kappa \), we set
\[ \Omega_{i,a} = \{ x \in M \text{ s.t. } \Phi_{i,a}^e(x) \geq \Phi_{j,a}^e(x) \text{ for all } 1 \leq j \leq \kappa \}. \]
We also set
\[ D(e) = \frac{y_2(1-e)}{2N}, \]
where \( y_2 \) is as in (5-8), and we define \( \nu_{\kappa,a} \) by
\[ \nu_{\kappa,a}^{(1-2\varepsilon)(n-2)/2} = \max \left\{ \mu_{\kappa+1,a}^{(1-2\varepsilon)(n-2)/2} ; \max_{1 \leq i \leq \kappa} \frac{\Phi_{i,a}^e(x)}{\Psi_{i,a}^e(x)} \right\}, \]
where
\[ \tilde{\Omega}_{i,a}^e = \{ x \in \Omega_{i,a}^e \text{ s.t. } d_g(x_i, x) \phi_{x_i}(x) \leq D(e) \}, \]
and \( \phi_{x_i}(x) = |u_{x_i}(x) - u_{x_i}(x) - \sum_{j=1}^{N} B_i(x) \phi_{j}(x)| \). By convention, the suprema in (6-9) are \(-\infty\) if the sets \( \tilde{\Omega}_{i,a}^e \) are empty. We can now start the proof of Proposition 6.1.

**Step 1.** \( \nu_{\kappa,a} = O(\mu_{\kappa,a}) \).

*Proof of Step 1.* We let \( y_a \in \tilde{\Omega}_{i,a}^e \) and assume that
\[ \nu_{\kappa,a}^{1-2\varepsilon} \psi_{a}^e(y_a)^{2/(n-2)} = \Phi_{i,a}^e(y_a)^{2/(n-2)}. \]
This and (5-8) imply that
\[ \nu_{\kappa,a}^{1-2\varepsilon} = O(\nu_{\kappa+1,a}^{1-2\varepsilon} \Phi_{i,a}^e(y_a)^{2/(n-2)}). \]
Since (\( \phi_k \)) holds and \( y_a \in \tilde{\Omega}_{i,a}^e \), we also have
\[ D(e) \leq o(1) + o \left( \sum_{j=1}^{\kappa} d_g(x_i, y_a)^{2} B_{j,a}(y_a)^{2^*-2} \right) + O(\mu_{\kappa,a}^{2} d_g(x_i, y_a)^{2} R_{k,a}(y_a)^{-4}). \]
Since \( y_a \in \tilde{\Omega}_{i,a}^e \) and \( \tilde{\Omega}_{i,a}^e \subseteq \Omega_{i,a}^e \), we can write
\[ \sum_{j=1}^{\kappa} d_g(x_i, y_a)^{2} B_{j,a}(y_a)^{2^*-2} = O(1), \]
and we thus get
\[ R_{k,a}(y_a)^{2} = O(\mu_{\kappa,a} d_g(x_i, y_a)). \]
If \( R_{k+1,a}(y_a) = O(R_{k,a}(y_a)) \), we get from (6-11) and (6-12) that
\[ \nu_{\kappa,a}^{1-2\varepsilon} = O(\mu_{\kappa,a}^{1-\varepsilon} d_g(x_i, y_a)^{1-\varepsilon} \Phi_{i,a}^e(y_a)^{2/(n-2)}). \]
and Step 1 is proved. Assume now that $R_{k,a}(y_a) = o(R_{k+1,a}(y_a))$. Then (6-12) becomes

$$
(d_g(x_{k,a}, y_a) + \mu_{k,a})^2 = O(\mu_{k,a} d_g(x_{i,a}, y_a)).
$$

(6-13)

If $i = \kappa$ we obtain $d_g(x_{i,a}, y_a) = O(\mu_{i,a})$; using the last equation in (4-4), and since $\mu_{i,a} = o(R_{k+1,a}(y_a))$, we obtain that

$$
d_g(x_{i,a}, y_a)^2 \left| \mathcal{U}_a(y_a) - \mathcal{U}_\infty(y_a) - \sum_{j=1}^{\kappa} B_{j,a}(y_a) \Lambda_j \right|^{2^*-2} \to 0 \quad \text{as } \alpha \to +\infty.
$$

This contradicts the fact that $y_a \in \hat{\Omega}_{i,a}^\varepsilon$. Thus we must have $1 \leq i \leq \kappa - 1$. Since $\Phi_{i,a}^\varepsilon(y_a) \geq \Phi_{k,a}^\varepsilon(y_a)$, because of (5-8), we can write

$$
\mu_{k,a}^{1-2\varepsilon} d_g(x_{k,a}, y_a)^{-2\varepsilon}(\mu_{k,a} + d_g(x_{k,a}, y_a))^{-2(1-2\varepsilon)} = O\left(\mu_{i,a}^{1-2\varepsilon} d_g(x_{i,a}, y_a)^{-2\varepsilon}(\mu_{i,a} + d_g(x_{i,a}, y_a))^{-2(1-2\varepsilon)}\right).
$$

In particular we obtain with (6-13) that

$$
(\mu_{i,a} + d_g(x_{i,a}, y_a))^{1-\varepsilon} = O(\mu_{k,a}^{1-2\varepsilon}).
$$

Since $\mu_{k,a} \leq \mu_{i,a}$, this implies that $d_g(x_{i,a}, y_a) = O(\mu_{i,a})$. We also get $\mu_{i,a} = O(\mu_{k,a})$. Then we obtain with (6-13) that $d_g(x_{k,a}, y_a) = O(\mu_{i,a})$, and this contradicts the first equation in (4-5) of Proposition 4.2.

Step 1 is proved.

**Step 2.** There exists $C_{\varepsilon} > 0$ such that

$$
|\mathcal{U}_a(x)| \leq C_{\varepsilon} \left(\sum_{i=1}^{\kappa} \Phi_{i,a}^\varepsilon(x) + v_{k,a}^{(1-2\varepsilon)(n-2)/2} r_{k+1,a}(x) [(2-n)(1-\varepsilon) + \max\{\|\mathcal{U}_\infty\|_\infty; \mu_{a}^{(1-2\varepsilon)(n-2)/2}\}] r_a(x) (2-n)^\varepsilon\right)
$$

for all $x \in M \setminus \bigcup_{i=1}^{N} B_{x_i,a}(R_0 \mu_{i,a})$.

**Proof of Step 2.** We let $y_a \in M \setminus \bigcup_{i=1}^{N} B_{x_i,a}(R_0 \mu_{i,a})$ be such that

$$
\sum_{i=1}^{\kappa} u_{i,a}^{\varepsilon} \Phi_{i,a}^\varepsilon + v_{k,a}^{(1-2\varepsilon)(n-2)/2} \Psi_{a,\varepsilon} + \Phi_{a}^\varepsilon(y_a) = \sup_{M \setminus \bigcup_{i=1}^{N} B_{x_i,a}(R_0 \mu_{i,a})} \sum_{i=1}^{\kappa} \Phi_{i,a}^\varepsilon + v_{k,a}^{(1-2\varepsilon)(n-2)/2} \Psi_{a,\varepsilon} + \Phi_{a}^\varepsilon,
$$

and we assume by contradiction that

$$
\sum_{i=1}^{\kappa} u_{i,a}^{\varepsilon} \Phi_{i,a}^\varepsilon + v_{k,a}^{(1-2\varepsilon)(n-2)/2} \Psi_{a,\varepsilon} + \Phi_{a}^\varepsilon(y_a) \to +\infty \quad \text{as } \alpha \to +\infty.
$$

(6-15)

From (6-13) and (6-15) we get

$$
r_a(y_a) \to 0 \quad \text{as } \alpha \to +\infty.
$$

(6-16)

We also have, using the second equation in (4-5),

$$
\frac{d_g(x_{j,a}, y_a)}{\mu_{j,a}} \to +\infty \quad \text{as } \alpha \to +\infty.
$$

(6-17)

as $\alpha \to +\infty$ for all $\kappa + 1 \leq j \leq N$. Here we used the fact that, by (6-9), $v_{k,a} \geq \mu_{k+1,a}$. Thanks to (6-15) and the second equation in (4-5), we also know that, for any $1 \leq j \leq \kappa$, either

$$
d_g(x_{j,a}, y_a) \leq R_0 \mu_{j,a} \quad \text{or} \quad \frac{d_g(x_{j,a}, y_a)}{\mu_{j,a}} \to +\infty \quad \text{as } \alpha \to +\infty.
$$

(6-18)
In particular, thanks to (6-14) we can write

\[
\Delta g \sum_{i=1}^{p} u_{i,a} (y_{a}) \geq \frac{\Delta g \left( \sum_{i=1}^{\kappa} \Phi_{i,a}^{\varepsilon} + \nu_{\kappa,a}^{(1-2\varepsilon)(n-2)/2}\Psi_{a,e} + \varphi_{a}^{\varepsilon} \right)}{\sum_{i=1}^{\kappa} \Phi_{i,a}^{\varepsilon} + \nu_{\kappa,a}^{(1-2\varepsilon)(n-2)/2}\Psi_{a,e} + \varphi_{a}^{\varepsilon}} (y_{a}). \tag{6-19}
\]

From (1-1), (5-8), and (5-9), we then get

\[
0 \geq \sum_{i=1}^{\kappa} \left( d_{g}(x_{i,a}, y_{a})^{-2} - \frac{|\mathcal{U}_{a}(y_{a})|^{2r-2}}{\gamma_{2\varepsilon}(1-\varepsilon)} - A_{\varepsilon} \right) \Phi_{i,a}^{\varepsilon}(y_{a}) \nonumber
\]

\[
+ \left( \frac{r_{K+1,a}(y_{a})^{-2}}{N\gamma_{1}^{2(1-\varepsilon)}} - \frac{|\mathcal{U}_{a}(y_{a})|^{2r-2}}{\gamma_{2\varepsilon}(1-\varepsilon)} - A_{\varepsilon} \right) \nu_{\kappa,a}^{(1-2\varepsilon)(n-2)/2}\Psi_{a,e}(y_{a}) \nonumber
\]

\[
+ \left( \frac{r_{a}(y_{a})^{-2}}{N\gamma_{1}^{2\varepsilon}} - \frac{|\mathcal{U}_{a}(y_{a})|^{2r-2}}{\gamma_{2\varepsilon}(1-\varepsilon)} - A_{\varepsilon} \right) \varphi_{a,e}(y_{a}). \tag{6-20}
\]

where

\[
A_{\varepsilon} = \frac{p \|A_{a}\|_{\infty} + (1 + \gamma_{3}\varepsilon)(1-\varepsilon)}{\gamma_{2\varepsilon}(1-\varepsilon)}.
\]

We let in the following \(1 \leq i \leq \kappa\) be such that \(y_{a} \in \Omega_{i,a}^{\varepsilon}\). Then we deduce from (6-20) that

\[
0 \geq \left( d_{g}(x_{i,a}, y_{a})^{-2} - \frac{\kappa}{\gamma_{2\varepsilon}(1-\varepsilon)} |\mathcal{U}_{a}(y_{a})|^{2r-2} - \kappa A_{\varepsilon} \right) \Phi_{i,a}^{\varepsilon}(y_{a}) \nonumber
\]

\[
+ \left( \frac{r_{K+1,a}(y_{a})^{-2}}{N\gamma_{1}^{2(1-\varepsilon)}} - \frac{|\mathcal{U}_{a}(y_{a})|^{2r-2}}{\gamma_{2\varepsilon}(1-\varepsilon)} - A_{\varepsilon} \right) \nu_{\kappa,a}^{(1-2\varepsilon)(n-2)/2}\Psi_{a,e}(y_{a}) \nonumber
\]

\[
+ \left( \frac{r_{a}(y_{a})^{-2}}{N\gamma_{1}^{2\varepsilon}} - \frac{|\mathcal{U}_{a}(y_{a})|^{2r-2}}{\gamma_{2\varepsilon}(1-\varepsilon)} - A_{\varepsilon} \right) \varphi_{a,e}(y_{a}). \tag{6-21}
\]

From (6-15), we know that

\[
\|\mathcal{U}_{\infty}\|_{\infty} = o(|\mathcal{U}_{a}(y_{a})|) \quad \text{and} \quad \mu_{a}^{(n-2)/2} = o(|\mathcal{U}_{a}(y_{a})|), \tag{6-22}
\]

and that

\[
B_{j,a}(y_{a}) = o(|\mathcal{U}_{a}(y_{a})|) \tag{6-23}
\]

for all \(1 \leq j \leq \kappa\) since

\[
B_{j,a}(y_{a}) = O(\Phi_{j,a}^{\varepsilon}(y_{a})) \tag{6-24}
\]

for all \(1 \leq j \leq \kappa\). From (6-17), we have

\[
R_{K+1,a}(y_{a})^{2}B_{j,a}(y_{a})^{2r-2} = o(1) \tag{6-25}
\]

for all \(\kappa + 1 \leq j \leq N\). Thus we can deduce from the last equation in (4-4) of Proposition 4.2 together with (6-22), (6-23), and (6-25), that

\[
\mathcal{O}_{a}(y_{a})^{2}|\mathcal{U}_{a}(y_{a})|^{2r-2} = o(1). \tag{6-26}
\]
Using (6-16) and (6-26), we can transform (6-21) into
\[
0 \geq \left( d_g(x_i,a, y_a)^{-2} - \frac{\kappa}{\gamma_2 \varepsilon (1 - \varepsilon)} |u_a(y_a)|^{2r-2} - \kappa A_{e} \right) \Phi^{\varepsilon}_{i,a}(y_a) \\
+ \left( \frac{r_{k+1,a}(y_a)^{-2}}{N \gamma_1^{2(1-\varepsilon)}} - \frac{|u_a(y_a)|^{2r-2}}{\gamma_2 \varepsilon (1 - \varepsilon)} - A_{e} \right) v_{k,a}^{(1-2e)(n-2)/2} \psi_{a,e}(y_a) \\
+ \left( \frac{1}{N \gamma_1^{2e}} + o(1) \right) r_a(y_a)^{-2} \varphi_{a,e}(y_a).
\] (6-27)

Since (g_k) holds true, we can prove with (6-22) and (6-23) that
\[
|u_a(y_a)|^{2r-2} = O(\mu_{k,a} R_{k+1,a}(y_a)^{-4}).
\] (6-28)

This implies that
\[
R_{k+1,a}(y_a)^2 |u_a(y_a)|^{2r-2} \to 0 \quad \text{as } \alpha \to +\infty.
\] (6-29)

Indeed, if it is not the case, we would have from (6-28) that
\[
R_{k+1,a}(y_a) = O(\mu_{k,a})
\]
and thanks to (6-26) that there exists \( j \in \{1, \ldots, \kappa \} \) such that
\[
d_g(x_j,a, y_a) + \mu_{j,a} = o(R_{k+1,a}(y_a)).
\]

In particular, we get a contradiction since \( \mu_{j,a} \geq \mu_{k,a} \). As a remark, (6-28) also implies that
\[
R_{k+1,a}(y_a) \to 0 \quad \text{as } \alpha \to +\infty,
\] (6-30)
due to (6-23). Now, thanks to (6-29) and (6-30), we deduce from (6-27) that
\[
0 \geq \left( d_g(x_i,a, y_a)^{-2} - \frac{\kappa}{\gamma_2 \varepsilon (1 - \varepsilon)} |u_a(y_a)|^{2r-2} - \kappa A_{e} \right) \Phi^{\varepsilon}_{i,a}(y_a) \\
+ \left( \frac{1}{N \gamma_1^{2(1-\varepsilon)}} + o(1) \right) v_{k,a}^{(1-2e)(n-2)/2} r_{k+1,a}(y_a)^{-2} \psi_{a,e}(y_a) \\
+ \left( \frac{1}{N \gamma_1^{2e}} + o(1) \right) r_a(y_a)^{-2} \varphi_{a,e}(y_a).
\] (6-31)

If \( y_a \notin \tilde{\Omega}^{\varepsilon}_{i,a} \), we transform (6-31) into
\[
0 \geq \left( 1 + o(1) - \frac{\kappa D(e)}{\gamma_2 \varepsilon (1 - \varepsilon)} - \kappa A_{e} d_g(x_i,a, y_a)^2 \right) d_g(x_i,a, y_a)^{-2} \Phi^{\varepsilon}_{i,a}(y_a) \\
+ \left( \frac{1}{N \gamma_1^{2(1-\varepsilon)}} + o(1) \right) v_{k,a}^{(1-2e)(n-2)/2} r_{k+1,a}(y_a)^{-2} \psi_{a,e}(y_a) + \left( \frac{1}{N \gamma_1^{2e}} + o(1) \right) r_a(y_a)^{-2} \varphi_{a,e}(y_a)
\]
by using (6-22) and (6-23). This leads to
\[
\left( \frac{1}{N \gamma_1^{2e}} + o(1) \right) r_a(y_a)^{-2} \varphi_{a,e}(y_a) = O(\mu_{i,a}^{(1-2e)(n-2)/2}),
\]
thanks to our choice of \( D(e) \). From (5-8), (6-16), and the definition of \( \varphi_{a,e} \), we clearly get a contradiction.
Thus $y_a \in \tilde{\Omega}^e_{i,a}$. Coming back to (6-31), we obtain in this situation that
\[
\left(\frac{1}{N} + o(1)\right)\psi^{(1-2\epsilon)(n-2)/2}_{\alpha} \leq \left(\frac{\kappa}{\gamma 2\epsilon (1-\epsilon)}\right) |\mathcal{U}_a(y_a)|^{2-\epsilon} + \kappa A \epsilon \right) r_{K+1,a}(y_a)^2 \Phi^e_{i,a}(y_a).
\]
Using (6-29), (6-30), and the definition of $\psi_{\alpha,a}$, this leads to
\[
\left(\frac{1}{N} + o(1)\right)\psi^{(1-2\epsilon)(n-2)/2}_{\alpha} \leq o(\Phi^e_{i,a}(y_a)) \leq o\left(\psi^{(1-2\epsilon)(n-2)/2}_{\alpha} \right)
\]
and this is again a contradiction. Thus (6-15) cannot hold true and we get the equation in Step 2 from (5-8). This ends the proof of Step 2.

**Step 3.** There exists $C_0 > 0$ such that
\[
|\mathcal{U}_a(x)| \leq C_0 \left(\sum_{i=1}^{K} B_{i,a}(x) + ||\mathcal{U}_a||_{\alpha} + \psi^{(n-2)/2}_{\alpha} \right) \text{ for all } x \in M \text{ and all } \alpha > 0.
\]

**Proof of Step 3.** We let $(y_a)$ be a sequence of points in $M$ and we aim to prove that
\[
\limsup_{a \to +\infty} \sum_{i=1}^{K} B_{i,a}(y_a) + ||\mathcal{U}_a||_{\alpha} + \psi^{(n-2)/2}_{\alpha} \leq < +\infty.
\]
Since $(\mathcal{U}_a)$ holds true, it is clear that (6-32) also holds true as soon as
\[
\mu^{(n-2)/2}_{\alpha} \leq O(B_{i,a}(y_a))
\]
for some $1 \leq i \leq \kappa$. By contradiction we assume in what follows that (6-32) does not hold true. Thus we assume from now on that
\[
R_{K+1,a}(y_a) = o\left(\mu_{i,a} \mu_{\kappa,a} + o\left(\frac{\mu_{\kappa,a} d(x_{i,a}, y_a)}{\mu_{i,a}}\right)\right)
\]
for all $1 \leq i \leq \kappa$. This implies in particular that
\[
R_{K+1,a}(y_a) \to 0 \quad \text{as } a \to +\infty.
\]
Thanks to the last equation in (4-4) and to (6-33), we can assume that
\[
\frac{R_{K+1,a}(y_a)}{\nu_{\kappa,a}} \to +\infty \quad \text{as } a \to +\infty.
\]
Indeed, otherwise, (6-32) holds true. We let $\lambda > 1$ be such that $\lambda p ||A||_{\alpha} \notin \text{Sp}(\Delta_g)$, where $\text{Sp}(\Delta_g)$ is the spectrum of $\Delta_g$, and let $G$ be the Green’s function of $\Delta_g = \Delta_g - \lambda p ||A||_{\alpha}$. There exist $C_1 > 1$, $C_2 > 0$ and $C_3 > 0$ such that
\[
\frac{1}{C_1} d_g(x, y)^{2-n} - C_2 \leq G(x, y) \leq C_1 d_g(x, y)^{2-n}
\]
and
\[
|\nabla G(x, y)| \leq C_3 d_g(x, y)^{1-n}
\]
for all $x, y \in M, x \neq y$. We let $x_0 \in \mathcal{U}$ be such that $d_g(y_a, x_0) \leq \delta + o(1)$; such an $x_0$ does exist thanks to (6-34). We choose $\delta > 0$ such that
\[
d_g(x, y) \geq 4\delta
\]
for all distinct \( x, y \in \mathcal{G} \), and such that
\[
\delta \leq \frac{1}{4} (C_1 C_2)^{-1/(n-2)},
\]  
(6-39)
where \( C_1 \) and \( C_2 \) are as in (6-36). We write with Green’s representation formula that
\[
\sum_{i=1}^{p} u_{i,a}(y_a) = \int_{B_{\delta}(2\delta)} G(y_a, x) \mathcal{L}_g \left( \sum_{i=1}^{p} u_{i,a} \right)(x) \, dv_g(x)
\]
\[
\quad + \int_{\partial B_{\delta}(2\delta)} G(y_a, x) \partial_v \left( \sum_{i=1}^{p} u_{i,a} \right)(x) \, d\sigma_g(x) - \int_{\partial B_{\delta}(2\delta)} \partial_v G(y_a, x) \left( \sum_{i=1}^{p} u_{i,a} \right)(x) \, d\sigma_g(x).
\]  
(6-40)
Since \( \lambda > 1 \), we get with (1-1) that
\[
\mathcal{L}_g \left( \sum_{i=1}^{p} u_{i,a} \right) \leq |u_a|^{2^* - 2} \sum_{i=1}^{p} u_{i,a}.
\]
We have \( G(y_a, x) \geq 0 \) in \( B_{\delta}(2\delta) \) for \( \alpha \) large by (6-36) and (6-39). Thus we can write
\[
\int_{B_{\delta}(2\delta)} G(y_a, x) \mathcal{L}_g \left( \sum_{i=1}^{p} u_{i,a} \right)(x) \, dv_g(x) \leq C_1 \int_{M} d_g(y_a, x)^{2-n}|u_a(x)|^{2^* - 2} \sum_{i=1}^{p} u_{i,a}(x) \, dv_g(x).
\]  
(6-41)
From (6-38), we also know that
\[
d_g(x_{i,a}, \partial B_{\delta}(2\delta)) \geq \delta
\]
for \( \alpha \) large. In particular, we can control the boundary terms in (6-40) thanks to Proposition 5.1 and standard elliptic theory. We thus obtain that
\[
|u_a(y_a)| = O \left( \max \{ \mu_a^{(n-2)/2}; \|u_\infty\|_\infty \} \right) + O \left( \int_{M} d_g(y_a, x)^{2-n} |u_a(x)|^{2^* - 1} \, dv_g(x) \right).
\]  
(6-42)
We can now write thanks to Step 2 that
\[
\int_{M} d_g(y_a, x)^{2-n} |u_a(x)|^{2^* - 1} \, dv_g(x) = O \left( \sum_{i=1}^{k} \int_{M} d_g(y_a, x)^{2-n} \Phi_{i,a}^2(x)^{2^*-1} \, dv_g(x) \right)
\]
\[
\quad + O \left( \max \{ \|u_\infty\|_\infty^{2^* - 1}; \mu_a^{(1-2\varepsilon)(n+2)/2} \} \int_{M} \frac{d_g(y_a, x)^{2-n}}{r_\alpha(x)^{(n+2)\varepsilon}} \, dv_g(x) \right)
\]
\[
\quad + O \left( \sqrt{\mu_a^{(1-2\varepsilon)(n+2)/2}} \int_{\{r_{\alpha+1,a}(x) \geq R_0 \}} \frac{d_g(y_a, x)^{2-n}}{r_{\alpha+1,a}(x)^{(n+2)(1-\varepsilon)}} \, dv_g(x) \right)
\]
\[
\quad + O \left( \int_{\{r_{\alpha+1,a}(x) \leq R_0 \}} d_g(y_a, x)^{2-n} |u_a|^2 \, dv_g(x) \right).
\]  
(6-43)
Since \( 0 < \varepsilon < \frac{1}{n+2} \), it follows from Giraud’s lemma that
\[
\int_{M} d_g(y_a, x)^{2-n} r_\alpha(x)^{-(n+2)\varepsilon} \, dv_g(x) = O(1).
\]  
(6-44)
We can also write, for \(1 \leq i \leq \kappa\),

\[
\int_M d_g(y_a, x) 2^{-n} \Phi_{i,a}^\varepsilon(x) d \nu_{\varepsilon}(x)
= O\left(\mu_{i,a}^{-(1-2\varepsilon)(n+2)/2} \int_{\{d_g(x_{i,a}, x) \leq \mu_{i,a}\}} d_g(y_a, x) 2^{-n} d_g(x_{i,a}, x)^{-n+2} d \nu_{\varepsilon}(x)\right) + O\left(\mu_{i,a}^{-(1-2\varepsilon)(n+2)/2} \int_{\{d_g(x_{i,a}, x) \geq \mu_{i,a}\}} d_g(y_a, x) 2^{-n} d_g(x_{i,a}, x)^{-n+2} d \nu_{\varepsilon}(x)\right)
\]

thanks to (5-8) and (6-4). Direct computations, using Giraud’s lemma and the inequalities \(0 < \varepsilon < \frac{1}{n+2}\), lead then to

\[
\int_M d_g(y_a, x) 2^{-n} \Phi_{i,a}^\varepsilon(x) d \nu_{\varepsilon}(x) = O(B_{i,a}(y_a)).
\] (6-45)

By direct computations, using Giraud’s lemma, the inequalities \(0 < \varepsilon < \frac{1}{n+2}\) and (6-35), we also get

\[
v_{\kappa,a}^{(1-2\varepsilon)(n+2)/2} \int_{\{x_{\kappa+1,a}(x) \geq R_{o\nu_{\kappa,a}}\}} d_g(y_a, x) 2^{-n} r_{\kappa+1,a}(x)^{-(n+2)(1-\varepsilon)} d \nu_{\varepsilon}(x) = O\left(v_{\kappa,a}^{(n-2)/2} R_{\kappa+1,a}(y_a)^{2-n}\right),
\] (6-46)

while, using (6-35), the fact that \(v_{\kappa,a} \geq \mu_{\kappa+1,a}\), and Hölder’s inequalities, we also have

\[
\int_{\{x_{\kappa+1,a}(x) \leq R_{o\nu_{\kappa,a}}\}} d_g(y_a, x) 2^{-n} |u_a| d \nu_{\varepsilon}(x) = O\left(v_{\kappa,a}^{(n-2)/2} R_{\kappa+1,a}(y_a)^{2-n}\right).
\] (6-47)

Coming back to (6-42) with (6-43)-(6-47), we obtain a contradiction with the assumption that (6-32) does not hold true. This proves Step 3.

The fourth step in the proof of Proposition 6.1 is as follows. The constants \(C > 0\) in the statement of this step and its proof are independent of \(\alpha\) and built on \(C_\kappa\). They may change from line to line.

**Step 4.** There exists \(C > 0\) such that for any sequence \((y_a)\) of points in \(M\),

\[
|u_a(y_a) - u_\infty(y_a) - \sum_{i=1}^\kappa B_{i,a}(y_a) \Lambda_i| \\
\leq \varepsilon_a \|u_\infty\|_\infty + o\left(\sum_{i=1}^\kappa B_{i,a}(y_a)\right) + C \left(\mu_{\alpha}^{(n-2)/2} + v_{\kappa,a}^{(n-2)/2} R_{\kappa+1,a}(y_a)^{2-n}\right),
\]

where \(\varepsilon_a \to 0\) as \(a \to +\infty\).

**Proof of Step 4.** Let \((y_a)\) be a sequence of points in \(M\). Assume first that

\[
R_{\kappa+1,a}(y_a) = O(v_{\kappa,a}).
\] (6-48)

If \(R_{\kappa+1,a}(y_a) = \mathcal{D}_{\alpha}(y_a)\), we can apply the last equation in (4-4) of Proposition 4.2 to obtain

\[
|u_a(y_a) - u_\infty(y_a) - \sum_{i=1}^\kappa B_{i,a}(y_a) \Lambda_i| \\
\leq C v_{\kappa,a}^{(n-2)/2} R_{\kappa+1,a}(y_a)^{2-n}.
\]

In particular, the estimate of Step 4 holds true. If \(\mathcal{D}_{\alpha}(y_a) < R_{\kappa+1,a}(y_a)\), then from Step 1 and (6-48) we obtain the existence of some \(1 \leq i \leq \kappa\) such that

\[
d_g(x_{i,a}, y_a) + \mu_{i,a} < R_{\kappa+1,a}(y_a) = O(\mu_{\kappa,a}).
\]
This implies the following facts:
\[
\begin{align*}
\mu_{i,a} &= O(\mu_{\kappa,a}), \\
d_g(x_{i,a}, y_a) &= O(\mu_{i,a}), \\
R_{\kappa+1,a}(y_a) &\geq \mu_{i,a}.
\end{align*}
\]

Using (4-5) in Proposition 4.2 we get
\[
\left| \mathcal{U}_a(y_a) - \mathcal{U}_\infty(y_a) - \sum_{i=1}^\kappa B_{i,a}(y_a) \Lambda_i \right| = o(B_{i,a}(y_a)),
\]
and the estimate of Step 4 holds also in this case. As a consequence, we may assume below that
\[
\frac{R_{\kappa+1,a}(y_a)}{v_{\kappa,a}} \rightarrow +\infty \quad \text{as } \alpha \rightarrow +\infty.
\]

The rest of the proof is based on controlling the different terms we get from Green’s representation formula. We let \( \mathcal{H} \) be the Green’s function of the Laplacian on \( M \) normalized such that \( \mathcal{H}(x, y) \geq 1 \) for all \( x, y \in M, x \neq y \). Then (5-25) holds and moreover
\[
(x, y) \mapsto d_g(x, y)^{n-2} \mathcal{H}(x, y)
\]
extends to a continuous function in \( M \times M \) whose value on the diagonal is
\[
\Phi(x, x) = \frac{1}{(n-2)\omega_{n-1}}
\]
for all \( x \). Now we write, for any \( i \in \{1, \ldots, p\} \),
\[
u_{i,a}(y_a) - \nu_{i,\infty}(y_a) = \frac{1}{V_g} \int_M (\nu_{i,a} - \nu_{i,\infty}) \, dv_g + \int_M \mathcal{H}(x, y_a) \Delta_g(\nu_{i,a} - \nu_{i,\infty})(x) \, dv_g(x). \tag{6-50}
\]

Since \( (\mathcal{H}_k) \) holds true, we can write
\[
\left| \int_M (\nu_{i,a} - \nu_{i,\infty}) \, dv_g \right| \leq C \mu_a^{(n-2)/2} + \varepsilon_a \| \mathcal{U}_\infty \|_\infty,
\]
where \( \varepsilon_a \rightarrow 0 \) as \( \alpha \rightarrow +\infty \). Thus we can transform (6-50) into
\[
\left| \nu_{i,a}(y_a) - \nu_{i,\infty}(y_a) - \int_M \mathcal{H}(x, y_a) \Delta_g(\nu_{i,a} - \nu_{i,\infty})(x) \, dv_g(x) \right| \leq C \mu_a^{(n-2)/2} + \varepsilon_a \| \mathcal{U}_\infty \|_\infty. \tag{6-51}
\]

In view of the equations satisfied by the \( \nu_{a,\cdot} \)’s and \( \mathcal{U}_\infty, \) we can now write
\[
\Delta_g(\nu_{i,a} - \nu_{i,\infty}) = |\nu_a|^{2^*-2} \nu_{i,a} - |\mathcal{U}_\infty|^{2^*-2} \nu_{i,\infty} - \sum_{j=1}^p A_{ij}^a \nu_{j,a} + \sum_{j=1}^p A_{ij} \nu_{j,\infty}
\]
\[
\begin{align*}
&= |\nu_a - \mathcal{U}_\infty|^{2^*-2} (\nu_{i,a} - \nu_{i,\infty}) + (|\nu_a|^{2^*-2} - |\mathcal{U}_\infty|^{2^*-2})(\nu_{i,a} - \nu_{i,\infty}) \\
&\quad + (|\nu_a|^{2^*-2} - |\mathcal{U}_\infty|^{2^*-2}) \nu_{i,\infty} - \sum_{j=1}^p A_{ij}^a (\nu_{j,a} - \nu_{j,\infty}) + \sum_{j=1}^p (A_{ij} - A_{ij}^a) \nu_{j,\infty}.
\end{align*}
\]
Thus we obtain

\[ \left| u_{i,a}(y_a) - u_{i,\infty}(y_a) - \int_M \mathcal{H}_{y_a} |\nabla u_{\infty} - \nabla u_{\infty}|^2 (u_{i,a} - u_{i,\infty}) \, dv_g \right| \]

\[ \leq \left| \int_M \mathcal{H}_{y_a} \left( |\nabla u_{\infty}|^2 - |\nabla u_{\infty}|^2 \right) (u_{i,a} - u_{i,\infty}) \, dv_g \right| + \left| \int_M \mathcal{H}_{y_a} \left( |\nabla u_{\infty}|^2 - |\nabla u_{\infty}|^2 \right) u_{i,\infty} \, dv_g \right| + \left| \sum_{j=1}^p \int_M \mathcal{H}_{y_a} \left( A_{ij} - A_{ij}^a \right) (x) u_{j,\infty} \, dv_g \right| \]

\[ + \left| \sum_{j=1}^p \int_M \mathcal{H}_{y_a} A_{ij}^a (u_{j,a} - u_{j,\infty}) \, dv_g \right| + C \mu_{\alpha}^{(n-2)/2} + \varepsilon_{\alpha} \|\nabla u_{\infty}\|, \quad (6-52) \]

where \( \mathcal{H}_{y_a}(x) = \mathcal{H}(y_a, x) \) for all \( x \). The convergence of the \( A_{\alpha} \)'s to \( A \), together with (5-25), implies that

\[ \sum_{j=1}^p \int_M \mathcal{H}_{y_a} (A_{ij} - A_{ij}^a) u_{j,\infty} \, dv_g = \varepsilon_{\alpha} \|\nabla u_{\infty}\|, \quad (6-53) \]

where \( \varepsilon_{\alpha} \to 0 \) as \( \alpha \to +\infty \). Now we get with (5-25) that

\[ \left| \sum_{j=1}^p \int_M \mathcal{H}_{y_a} A_{ij}^a (u_{j,a} - u_{j,\infty}) \, dv_g \right| \leq p C \|A_{\alpha}\| \int_M d_g(y_a, x)^{2-n} |\nabla u_{\alpha}(x) - \nabla u_{\infty}(x)| \, dv_g(x). \]

Thanks to (4-\( \mathcal{H}_{\kappa} \)), we can write

\[ |\nabla u_{\alpha}(x) - \nabla u_{\infty}(x)| \leq D_1 \sum_{j=1}^K B_{j,\alpha}(x) + \mu_{\kappa,\alpha}^{(n-2)/2} R_{\kappa+1,\alpha}(x)^{2-n} + \mu_{\alpha}^{(n-2)/2} + \varepsilon_{\alpha} \|\nabla u_{\infty}\| \]

for some \( D_1 > 0 \), where \( \varepsilon_{\alpha} \to 0 \) as \( \alpha \to +\infty \), while, thanks to Step 3, we have

\[ |\nabla u_{\alpha}(x) - \nabla u_{\infty}(x)| \leq D_2 \sum_{j=1}^K B_{j,\alpha}(x) + v_{\kappa,\alpha}^{(n-2)/2} R_{\kappa+1,\alpha}(x)^{2-n} + \|\nabla u_{\infty}\| \]

for some \( D_2 > 0 \). Thus we can write

\[ \left| \sum_{j=1}^p \int_M \mathcal{H}_{y_a} A_{ij}^a (u_{j,a} - u_{j,\infty}) \, dv_g \right| \leq C \left( \sum_{j=1}^K \int_M d_g(y_a, x)^{2-n} B_{j,\alpha}(x) \, dv_g(x) \right) + \varepsilon_{\alpha} \|\nabla u_{\infty}\| + C \mu_{\alpha}^{(n-2)/2} \]

\[ + C \mu_{\kappa,\alpha}^{(n-2)/2} \int_{R_{\kappa+1,\alpha}(x) \geq \eta_a} d_g(y_a, x)^{2-n} R_{\kappa+1,\alpha}(x)^{2-n} \, dv_g(x) \]

\[ + C v_{\kappa,\alpha}^{(n-2)/2} \int_{R_{\kappa+1,\alpha}(x) \leq \eta_a} d_g(y_a, x)^{2-n} R_{\kappa+1,\alpha}(x)^{2-n} \, dv_g(x), \]

where \( \eta_a = 2 \text{diam}_g M \) if \( \nabla u_{\infty} \equiv 0 \), \( \eta_a = \mu_{\kappa,\alpha}^{1/2} \) otherwise, and \( \text{diam}_g M \) is the diameter of \( M \) with respect to \( g \). Simple computations, using Giraud’s lemma, then lead to the estimate

\[ \left| \sum_{j=1}^p \int_M \mathcal{H}_{y_a} A_{ij}^a (u_{j,a} - u_{j,\infty}) \, dv_g \right| \]

\[ \leq a \left( \sum_{j=1}^K |B_{j,\alpha}(y_a)| \right) + C \mu_{\alpha}^{(n-2)/2} + \varepsilon_{\alpha} \|\nabla u_{\infty}\| + C v_{\kappa,\alpha}^{(n-2)/2} R_{\kappa+1,\alpha}(y_a)^{2-n}. \quad (6-54) \]
If $\mathcal{U}_\infty \equiv 0$, we have
\[
\int_M \mathcal{H}_{y_0} (|\mathcal{U}_\alpha|^{2^* - 2} - |\mathcal{U}_\infty|^{2^* - 2}) u_{i, \infty} dv_g = 0,
\]
while, if $\mathcal{U}_\infty \not\equiv 0$, we write, thanks to Proposition 5.1,
\[
\int_M \mathcal{H}_{y_0} (|\mathcal{U}_\alpha|^{2^* - 2} - |\mathcal{U}_\infty|^{2^* - 2}) u_{i, \infty} dv_g = o(1) + \int_{[\vartheta_a \leq \mu_a^{1/4}]} \mathcal{H}_{y_0} (|\mathcal{U}_\alpha|^{2^* - 2} - |\mathcal{U}_\infty|^{2^* - 2}) u_{i, \infty} dv_g
\]
\[
= o(1) + O \left( \int_{[\vartheta_a \leq \mu_a^{1/4}]} d_g(x, y_\alpha)^{2-n} |\mathcal{U}_\alpha(x)|^{2^* - 2} dv_g(x) \right). \tag{6-55}
\]
Now we use Step 3 and we briefly distinguish the $n = 3, 4, 5$, and $n \geq 6$ cases in the forthcoming computations. We let $(R_\alpha)_\alpha$ be suitably chosen such that $R_\alpha \to +\infty$ as $\alpha \to +\infty$. Assuming that $n = 3, 4, 5$, we write with (6-55) that
\[
\int_M \mathcal{H}_{y_0} (|\mathcal{U}_\alpha|^{2^* - 2} - |\mathcal{U}_\infty|^{2^* - 2}) u_{i, \infty} dv_g
\]
\[
= o(1) + O \left( \sum_{j=1}^{K} \int_{[R_{k+1, \alpha} \geq R_{k+1, \alpha}(y_\alpha)/R_\alpha]} d_g(x, y_\alpha)^{2-n} |\mathcal{U}_\alpha(x)|^{2^* - 2} dv_g(x) \right)
\]
\[
+ O \left( \int_{[R_{k+1, \alpha} \geq R_{k+1, \alpha}(y_\alpha)/R_\alpha]} d_g(x, y_\alpha)^{2-n} R_{k+1, \alpha}(x)^{-4} dv_g(x) \right)
\]
\[
= o(1) + o \left( \sum_{j=1}^{K} B_{J, \alpha}(y_\alpha) \right) + o \left( v_{k, \alpha}^{n-2}/2 R_{k+1, \alpha}(y_\alpha)^{2-n} \right),
\]
and, assuming that $n \geq 6$, since $2^* - 2 \in (0, 1]$ in this case, we get from (6-55) that
\[
\int_M \mathcal{H}_{y_0} (|\mathcal{U}_\alpha|^{2^* - 2} - |\mathcal{U}_\infty|^{2^* - 2}) u_{i, \infty} dv_g = o(1) + O \left( \int_{[\vartheta_a \leq \mu_a^{1/4}]} d_g(x, y_\alpha)^{2-n} |\mathcal{U}_\alpha(x)| dv_g(x) \right)
\]
\[
= o(1) + O \left( \sum_{j=1}^{K} \int_M d_g(x, y_\alpha)^{2-n} B_{J, \alpha}(x) dv_g(x) \right)
\]
\[
+ O \left( v_{k, \alpha}^{n-2}/2 \int_M d_g(x, y_\alpha)^{2-n} R_{k+1, \alpha}(x)^{2-n} dv_g(x) \right)
\]
\[
= o(1) + o \left( \sum_{j=1}^{K} B_{J, \alpha}(y_\alpha) \right) + o \left( v_{k, \alpha}^{n-2}/2 R_{k+1, \alpha}(y_\alpha)^{2-n} \right).
Thus, in all cases,
\[
\int_M \mathcal{H}_a \left( |u_a|^{2^* - 2} - |u_\infty|^{2^* - 2} \right) u_{i,\infty} \, dv_g = o\left( \sum_{j=1}^\kappa B_{j,a}(y_a) \right) + o\left( \nu_{\kappa,a}^{(n-2)/2} R_{\kappa+1,a}(y_a)^{2-n} \right) + \varepsilon_a \|u_\infty\|_\infty. \quad (6-56)
\]
Similarly, if \( u_\infty = 0 \), then
\[
\int_M \mathcal{H}_a \left( |u_a|^{2^* - 2} - |u_a - u_\infty|^{2^* - 2} \right) (u_{i,a} - u_{i,\infty}) \, dv_g = 0,
\]
while, if \( u_\infty \neq 0 \), we can write
\[
\int_M \mathcal{H}_a \left( |u_a|^{2^* - 2} - |u_a - u_\infty|^{2^* - 2} \right) (u_{i,a} - u_{i,\infty}) \, dv_g = o(1) + O\left( \int_{|a(x)| \leq \mu_a^{1/4}} d_g(y_a, x)^{2-n} \|u_a(x)\|^{2^* - 2} \, dv_g(x) \right) \]
\[
= o(1) + o\left( \sum_{j=1}^\kappa B_{j,a}(y_a) \right) + o\left( \nu_{\kappa,a}^{(n-2)/2} R_{\kappa+1,a}(y_a)^{2-n} \right).
\]
Thus we have obtained
\[
\int_M \mathcal{H}_a \left( |u_a|^{2^* - 2} - |u_a - u_\infty|^{2^* - 2} \right) (u_{i,a} - u_{i,\infty}) \, dv_g
\]
\[
= o\left( \sum_{j=1}^\kappa B_{j,a}(y_a) \right) + o\left( \nu_{\kappa,a}^{(n-2)/2} R_{\kappa+1,a}(y_a)^{2-n} \right) + \varepsilon_a \|u_\infty\|_\infty. \quad (6-57)
\]
Coming back to (6-52): thanks to (6-53)–(6-57), we now obtain
\[
\left| u_a(y_a) - u_\infty(y_a) - \int_M \mathcal{H}_a u_a - u_\infty \, dv_g \right|
\]
\[
\leq o\left( \sum_{j=1}^\kappa B_{j,a}(y_a) \right) + o\left( \nu_{\kappa,a}^{(n-2)/2} R_{\kappa+1,a}(y_a)^{2-n} \right) + \varepsilon_a \|u_\infty\|_\infty + C \mu_a^{(n-2)/2}. \quad (6-58)
\]
Using (4-5), (5-25), and the extension property of \( d_g(x, y)^{n-2} \mathcal{H}(x, y) \) mentioned above, we can find a sequence \( (R_{\alpha})_\alpha \) such that \( R_{\alpha} \to +\infty \) as \( \alpha \to +\infty \), that
\[
\left| \int_{M_{i,a}} \mathcal{H}_a |u_a - u_\infty|^{2^* - 2} (u_a - u_\infty) \, dv_g - B_{i,a}(y_a) \right| \leq C \mu_a^{(n-2)/2} + o(B_{i,a}(y_a))
\]
for all \( i \in \{1, \ldots, \kappa\} \), and that the sets
\[
M_{i,a} = B_{x_{i,a}}(R_{\alpha} \mu_{i,a}) \setminus \bigcup_{i+1 \leq j \leq N} B_{x_{j,a}}(R_{\alpha}^{-1} \mu_{i,a})
\]
are disjoint.
Then we can write thanks to Proposition 5.1, Step 3, and (6-49), that
\[
\int_{M \setminus \bigcup_{1 \leq j \leq n} M_{i,a}} d_g(y_a, x)^{2-n} |\partial u_a(x) - \partial u_\infty(x)|^{2^* - 1} dv_g(x)
\leq \varepsilon_a \|\partial u_\infty\|_\infty + C \mu_a^{(n-2)/2} + C \sum_{j=1}^\kappa \int_{M_a} d_g(y_a, x)^{2-n} B_{j,a}(x) \, dv_g(x)
\]
\[
+ C \nu_{\kappa,a}^{(n+2)/2} \sum_{\{\kappa, a \geq v_{k,a}\}} d_g(y_a, x)^{2-n} \frac{R_{\kappa+1,a}(y_a)^2}{(n+2)} \, dv_g(x) + C \nu_{\kappa,a}^{(n-2)/2} R_{\kappa+1,a}(y_a)^{2-n}
\]
\[
\leq \varepsilon_a \|\partial u_\infty\|_\infty + C \mu_a^{(n-2)/2} + o \left( \sum_{j=1}^\infty B_{j,a}(y_a) \right) + C \nu_{\kappa,a}^{(n-2)/2} R_{\kappa+1,a}(y_a)^{2-n}.
\]

Coming back to (6-58), this ends the proof of Step 4. \qed

**Step 5.** \( \nu_{\kappa,a} = \mu_{\kappa+1,a}. \)

**Proof of Step 5.** We proceed by contradiction and thus assume that there exists \( i \in \{1, \ldots, \kappa\} \) and a sequence \( (y_a) \) of points in \( \tilde{\Omega}_{i,a}^\varepsilon \) such that
\[
y_{k,a}^{(1-2\varepsilon)(n-2)/2} \psi_{a}^{\varepsilon}(y_a) = \Phi_{i,a}^{\varepsilon}(y_a). \tag{6-59}
\]
Since \( y_a \in \tilde{\Omega}_{i,a}^\varepsilon \), we know that
\[
\Phi_{i,a}^{\varepsilon}(y_a) \geq \Phi_{j,a}^{\varepsilon}(y_a) \tag{6-60}
\]
for all \( 1 \leq j \leq \kappa \) and that
\[
d_g(x_{i,a}, y_a)^2 |\partial u_a(y_a) - \partial u_\infty(y_a) - \sum_{j=1}^\kappa B_{j,a}(y_a) \Lambda_j|^{2^*-2} \geq D(\varepsilon). \tag{6-61}
\]
Clearly,
\[
d_g(x_{i,a}, x)^2 B_{i,a}(y_a)^{2^*-2} = O(1). \tag{6-62}
\]
We now claim that
\[
d_g(x_{i,a}, y_a)^2 B_{j,a}(y_a)^{2^*-2} \rightarrow 0 \quad \text{as} \ a \rightarrow +\infty \tag{6-63}
\]
for all \( 1 \leq j \leq \kappa, j \neq i \). In order to prove (6-63), we proceed by contradiction once again and assume that there exists \( 1 \leq j \leq \kappa, j \neq i, \) such that
\[
(d_g(x_{j,a}, y_a) + \mu_{j,a})^2 = O(\mu_{j,a} d_g(x_{i,a}, y_a)). \tag{6-64}
\]
Since \( \Phi_{i,a}^{\varepsilon}(y_a) \geq \Phi_{j,a}^{\varepsilon}(y_a) \), we then get
\[
(d_g(x_{i,a}, y_a) + \mu_{i,a})^{1-\varepsilon} = O(\mu_{j,a}^{1-2\varepsilon} H_{i,a}^{1-2\varepsilon}),
\]
so \( \mu_{i,a} = O(\mu_{j,a}) \) and \( d_g(x_{i,a}, y_a)^{1-\varepsilon} = O(\mu_{j,a}^{1-2\varepsilon}) \). Coming back to (6-64), we also obtain \( \mu_{j,a} = O(\mu_{i,a}) \) and \( d_g(x_{j,a}, y_a) = O(\mu_{i,a}) \). This contradicts the first equation in (4-5). Thus (6-63) is proved. Applying Step 4, we get from (6-61), (6-62), and (6-63) that
\[
R_{\kappa+1,a}(y_a)^2 = O(\nu_{\kappa,a} d_g(x_{i,a}, y_a)). \tag{6-65}
\]
Using (5-8) and (6-59), we also have
\[
(d_{g}(x_{i,a}, y_{a}) + \mu_{i,a})^{2(1-\varepsilon)} = O\left(\mu_{i,a}^{-2\varepsilon} v_{\kappa_{a}}^{-2\varepsilon-1} R_{\kappa_{a}+1,a}(y_{a})^{2(1-\varepsilon)}\right),
\]
so that, with (6-65) and Step 1, we get that \(\mu_{i,a} = O(\mu_{\kappa_{a}})\), that \(d_{g}(x_{i,a}, y_{a}) = O(\mu_{i,a})\) and that \(\mu_{i,a} = O(R_{\kappa_{a}+1,a}(y_{a}))\). Using the second equation in (4-5) of Proposition 4.2 we then obtain
\[
d_{g}(x_{i,a}, y_{a})^2 |\hat{u}_{a}(y_{a}) - \hat{B}_{i,a} \Lambda_{i}(y_{a})|^{2^{*}-2} \to 0 \quad \text{as} \quad \alpha \to +\infty.
\]
This contradicts (6-61) thanks to (6-63). Step 5 is proved. \(\square\)

**Conclusion of the proof of Proposition 6.1.** By Proposition 5.1 we know that \(\mathcal{J}_{1}\) holds true. By Steps 4 and 5, and by induction, it follows that \(\mathcal{J}_{N}\) holds true. It remains to prove that \(\mathcal{J}_{N+1}\) also holds true. For this we proceed with similar arguments to those developed in the proof of Step 4. We let \((y_{a})\) be a sequence of points in \(M\) and write, for any \(i = 1, \ldots, p\),
\[
u_{i,a}(y_{a}) - u_{i,\infty}(y_{a}) = \frac{1}{V_{g}} \int_{M} (\nu_{i,a} - u_{i,\infty}) d\nu_{g} + \int_{M} \mathcal{H}_{y_{a}} \Delta_{g}(\nu_{i,a} - u_{i,\infty}) d\nu_{g},
\]
where \(\mathcal{H}_{y_{a}} (\cdot) = \mathcal{H}(\cdot, y_{a})\) and \(\mathcal{H}\) is the Green’s function of \(\Delta_{g}\) normalized so that \(\mathcal{H} \geq 1\). Since \(\mathcal{J}_{N}\) holds true,
\[
\int_{M} |\nu_{i,a} - u_{i,\infty}| d\nu_{g} \leq C \mu_{\alpha}^{(n-2)/2} + \varepsilon_{\alpha} \|\hat{u}_{\infty}\|_{\infty},
\]
where \(C > 0\) is independent of \(\alpha\), and \(\varepsilon_{\alpha} \to 0\) as \(\alpha \to +\infty\). Using the equations satisfied by the \(\hat{u}_{a}\)’s and \(\hat{u}_{\infty}\), but also \(\mathcal{J}_{N}\), mimicking what was done in the proof of Step 4, we get with (6-66) that
\[
\left|\hat{u}_{a}(y_{a}) - \hat{u}_{\infty}(y_{a}) - \int_{M} \mathcal{H}_{y_{a}} |\hat{u}_{a} - \hat{u}_{\infty}|^{2^{*}-2}(\nu_{i,a} - u_{i,\infty}) d\nu_{g}\right|
\leq C \mu_{\alpha}^{(n-2)/2} + o\left(\sum_{i=1}^{N} B_{i,a}(y_{a})\right) + \varepsilon_{\alpha} \|\hat{u}_{\infty}\|_{\infty}. \quad (6-67)
\]

We also have
\[
\left|\int_{M} \mathcal{H}_{y_{a}} |\hat{u}_{a} - \hat{u}_{\infty}|^{2^{*}-2}(\nu_{i,a} - u_{i,\infty}) d\nu_{g} - \sum_{i=1}^{N} B_{i,a}(y_{a}) \Lambda_{i}\right|
\leq C \mu_{\alpha}^{(n-2)/2} + o\left(\sum_{i=1}^{N} B_{i,a}(y_{a})\right) + \varepsilon_{\alpha} \|\hat{u}_{\infty}\|_{\infty}, \quad (6-68)
\]
where \(C > 0\) in (6-67), (6-68) is independent of \(\alpha\), and \(\varepsilon_{\alpha} \to 0\) as \(\alpha \to +\infty\). Combining (6-67) and (6-68), we get \(\mathcal{J}_{N+1}\). This ends the proof of Proposition 6.1. \(\square\)

**7. A Pohozaev identity for systems**

Let \((M, g)\) be a smooth compact Riemannian manifold. Let also \(X\) be a smooth 1-form over \(M\) and \(\mathcal{U} : M \to \mathbb{R}^{p}\) be a \(C^{2}\)-map. We define \(X(\nabla \mathcal{U})\) by \(X(\nabla \mathcal{U}) = (\nabla \mathcal{U}, X)\). This is a \(p\)-map with components \(X(\nabla \mathcal{U})_{i} = (\nabla u_{i}, X)\) where the \(u_{i}\)’s are the components of \(\mathcal{U}\). We define also \(|\nabla \mathcal{U}|\) and \((T_{X} X)\mathcal{U}\) by \(|\nabla \mathcal{U}|^{2} = \sum_{i=1}^{p} |\nabla u_{i}|^{2}\) and \((T_{X} X)\mathcal{U} = \sum_{i=1}^{p} S_{X}^{2}(\nabla u_{i}, \nabla u_{i})\), where \(S_{X}^{2}\) is the \((0, 2)\)-tensor field we obtain
from the (2, 0)-tensor field $S_X$ by the musical isomorphism, and

$$S_X = \nabla X - \frac{1}{n}(\text{div}_g X)g.$$  \hfill (7-1)

For $\Omega$ a smooth bounded domain in $M$ we let $\nu$ be the unit outer normal to $\partial \Omega$. The Pohozaev-type identity for systems we prove is stated as follows.

**Proposition 7.1.** Let $(M, g)$ be a smooth compact Riemannian $n$-manifold, $\Omega$ be a smooth bounded domain in $M$, and $A : M \to M^*_\nu(\mathbb{R})$ be a $C^1$-map. Let $X$ be a smooth 1-form over $M$ and $\mathcal{U}$ be a solution of (0-1). Then

$$\int_\Omega \langle A\mathcal{U}, X(\nabla \mathcal{U}) \rangle_{\mathbb{R}^p} dv_g + \frac{n-2}{4n} \int_\Omega (\Delta_g(\text{div}_g X))|\mathcal{U}|^2 dv_g + \frac{n-2}{2n} \int_\Omega (\text{div}_g X)(A\mathcal{U}, \mathcal{U})_{\mathbb{R}^p} dv_g$$

$$= - \int_\Omega (T_X X)_{\mathcal{U}} dv_g + \frac{n-2}{2n} \int_{\partial \Omega} X(\nu)|\mathcal{U}|^2 d\sigma_g - \frac{n-2}{4n} \int_{\partial \Omega} \partial_\nu(\text{div}_g X)|\mathcal{U}|^2 d\sigma_g$$

$$+ \frac{n-2}{2n} \int_{\partial \Omega} (\text{div}_g X)(\partial_\nu \mathcal{U}, \mathcal{U})_{\mathbb{R}^p} d\sigma_g - \int_{\partial \Omega} B_{\mathbb{R}^p}(\mathcal{U}) d\sigma_g, \hfill (7-2)$$

where $X(\nabla \mathcal{U})$ and $(T_X X)_{\mathcal{U}}$ are as above, $B_{\mathbb{R}^p}(\mathcal{U}) = \frac{1}{2} X(\nu)|\nabla \mathcal{U}|^2 - (X(\nabla \mathcal{U}), \partial_\nu \mathcal{U})_{\mathbb{R}^p}$ on $\partial \Omega$, and $(\cdot, \cdot)_{\mathbb{R}^p}$ is the scalar product in $\mathbb{R}^p$.

**Proof.** Integrating by parts we easily see that for $u : M \to \mathbb{R}$ of class $C^2$,

$$\int_\Omega \langle \nabla u, X \rangle \Delta_g u dv_g = \int_\Omega S^2_{X,2} (\nabla u, \nabla u) dv_g + \int_{\partial \Omega} \left( \frac{1}{2} \int_\Omega X(\nu)|\nabla u|^2 - (\nabla u, X)\partial_\nu u \right) d\sigma_g, \hfill (7-3)$$

where $S_{X,2} = \nabla X - \frac{1}{2}(\text{div}_g X)g$. If we assume now that $\mathcal{U}$ is a $p$-map, applying (7-3) to the components $u_i$ of $\mathcal{U}$, and summing over $i$, we obtain

$$\int_\Omega \langle X(\nabla \mathcal{U}), \Delta_g \mathcal{U} \rangle_{\mathbb{R}^p} dv_g = \int_\Omega S^2_{X,2} (\nabla \mathcal{U}, \nabla \mathcal{U}) dv_g + \int_{\partial \Omega} B_{\mathbb{R}^p}(\mathcal{U}) d\sigma_g.$$

We assume now that $\mathcal{U}$ solves (0-1) and we use the equations satisfied by $\mathcal{U}$ to explicit the left-hand side in the preceding equation. We can write

$$\int_\Omega \langle X(\nabla \mathcal{U}), \Delta_g \mathcal{U} \rangle_{\mathbb{R}^p} dv_g = \int_\Omega |\mathcal{U}|^{2^* - 2} \langle X(\nabla \mathcal{U}), \mathcal{U} \rangle_{\mathbb{R}^p} dv_g - \int_\Omega \langle A\mathcal{U}, X(\nabla \mathcal{U}) \rangle_{\mathbb{R}^p} dv_g$$

$$= \frac{1}{2^*} \int_\Omega |\nabla |^{2^*} X \rangle dvd_g - \int_\Omega \langle A\mathcal{U}, X(\nabla \mathcal{U}) \rangle_{\mathbb{R}^p} dv_g$$

$$= - \frac{1}{2^*} \int_\Omega (\text{div}_g X)|\mathcal{U}|^{2^*} dv_g - \int_\Omega \langle A\mathcal{U}, X(\nabla \mathcal{U}) \rangle_{\mathbb{R}^p} dv_g + \frac{1}{2^*} \int_{\partial \Omega} X(\nu)|\mathcal{U}|^{2^*} d\sigma_g.$$

Then we get

$$\int_\Omega \langle A\mathcal{U}, X(\nabla \mathcal{U}) \rangle_{\mathbb{R}^p} dv_g + \frac{1}{2^*} \int_\Omega (\text{div}_g X)|\mathcal{U}|^{2^*} dv_g + \int_\Omega S^2_{X,2} (\nabla \mathcal{U}, \nabla \mathcal{U}) dv_g$$

$$= \frac{1}{2^*} \int_{\partial \Omega} X(\nu)|\mathcal{U}|^{2^*} d\sigma_g - \int_{\partial \Omega} B_{\mathbb{R}^p}(\mathcal{U}) d\sigma_g.$$

\hfill \square
Using once again (0-1), we obtain
\[
\int_\Omega S^2_X(\nabla \varphi, \nabla \varphi) \, dv_g = \int_\Omega S^2_X(\nabla \varphi, \nabla \varphi) \, dv_g - \frac{1}{2\pi} \int_\Omega (\text{div}_g X) |\nabla \varphi|^2 \, dv_g
\]
\[
= \int_\Omega S^2_X(\nabla \varphi, \nabla \varphi) \, dv_g - \frac{1}{2\pi} \int_\Omega (\text{div}_g X) (\nabla \varphi, \varphi)\, d\sigma_g
\]
\[
+ \frac{n-2}{4n} \int_{\mathcal{F}_0} \hat{c}_0 (\text{div}_g X) |\varphi|^2 \, d\sigma_g + \frac{n-2}{4n} \int_\Omega (\Delta_g (\text{div}_g X)) |\varphi|^2 \, dv_g
\]
\[
- \frac{1}{2\pi} \int_\Omega (\text{div}_g X) |\varphi|^2 \, dv_g + \frac{1}{2\pi} \int_\Omega (\text{div}_g X) (A\varphi, \varphi)\, d\sigma_g,
\]
and (7-2) easily follows. This ends the proof of the proposition. \qed

The Pohozaev-type identity (7-2) is used repeatedly, with different choices of $X$, in the next section.

8. The range of influence of blow-up points

We start with notations and the definition of the range of influence of blow-up points. The blow-up points $x_{i,a}$ of Proposition 4.2 come with vector bubbles $(\mathcal{B}^i_a)_a$ as in the same proposition. We let $\Lambda_i$ be the $S^{p-1}$ projection of $(\mathcal{B}^i_a)_a$, and $B_{i,a} = [\mathcal{B}^i_a]$ for all $i$ and all $a$. As above, $(A_a)_a$ is a sequence of $C^1$ maps from $M$ to $M^p(R)$ such that $A_a \to A$ in $C^1(M)$ as $a \to +\infty$ for some $C^1$ map $A$ from $M$ to $M^p(R)$ satisfying (H), and we order the blow-up points in such a way that
\[
\mu_a = \mu_{1,a} \geq \cdots \geq \mu_{N,a},
\]
where the $\mu_{i,a}$'s are the weights of the vector bubble $(\mathcal{B}^i_a)_a$. Given $i, j \in \{1, \ldots, N\}, i \neq j$, we let $s_{i,j,a}$ be given by
\[
s_{i,j,a}^2 = \frac{\mu_{i,a}}{\mu_{j,a}} \frac{d_g(x_{i,a}, x_{j,a})^2}{n(n-2)} + \mu_{i,a} \mu_{j,a} = \mu_{i,a} B_{j,a}(x_{i,a})^{-2/(n-2)}
\]
and we define the range of influence of the blow-up point $x_{i,a}$ by
\[
r_{i,a} = \begin{cases} \min_{j \in \mathcal{A}_i} s_{i,j,a} & \text{if } \mathcal{U}_\infty \equiv 0, \\ \min \{ \min_{j \in \mathcal{A}_i} s_{i,j,a}, \sqrt{\mu_{i,a}} \} & \text{if } \mathcal{U}_\infty \not\equiv 0. \end{cases}
\]
where
\[
\mathcal{A}_i = \{ j \in \{1, \ldots, N\}, j \neq i \text{ s.t. } \mu_{i,a} = O(\mu_{j,a}) \}.
\]
If $\mathcal{A}_i = \emptyset$ (so that, in particular, $i = 1$) and $\mathcal{U}_\infty \equiv 0$, we let by definition $r_{i,a} = \frac{1}{2} i_g$, where $i_g$ is the injectivity radius of $(M, g)$. Using the first equation in (4-5) it is easily checked that
\[
s_{i,j,a} \not\to +\infty \text{ as } \alpha \not\to +\infty \text{ for all } i, j \in \{1, \ldots, N\} \text{ and all } j \in \mathcal{A}_i.
\]
This implies in particular that
\[
\frac{r_{i,a}}{\mu_{i,a}} \not\to +\infty \text{ as } \alpha \not\to +\infty.
\]
If $j \in \mathcal{A}_i$ and $i \in \mathcal{A}_j$, we let $\lambda_{i,j} \geq 0$ be given by
\[
\lambda_{i,j} = \left( \lim_{\alpha \to +\infty} \frac{\mu_{j,a}}{\mu_{i,a}} \right)^{(n-2)/2}.
\]
Given $i \in \{1, \ldots, N\}$, we also let
\[
\mathcal{B}_i = \begin{cases} 
\{ j \in \{1, \ldots, N\}, j \neq i \text{ s.t. } d_g(x_i, x_j) = O(r_i) \} & \text{if } r_i \to 0, \\
\{ j \in \{1, \ldots, N\}, j \neq i \text{ s.t. } x_j \in B_{x_i}(\frac{1}{2} r_i) \} & \text{if } r_i \not\to 0.
\end{cases}
\tag{8-8}
\]
and, for $j \in \mathcal{B}_i$,
\[
z_{i,j} = \lim_{a \to +\infty} r_{i,a}^{-1} \exp^{-1}(x_{j,a}).
\tag{8-9}
\]
Up to a subsequence, all these limits exist. We let $\delta_i > 0$ be such that for any $i$ and any $j \in \mathcal{B}_i$,
\[
|z_{i,j}| \neq 0 \Rightarrow |z_{i,j}| \geq 10 \delta_i.
\tag{8-10}
\]
We also define $\mathcal{C}_i$ to be the subset of $\mathcal{B}_i$ given by
\[
\mathcal{C}_i = \{ j \in \mathcal{B}_i \text{ s.t. } z_{i,j} = 0 \} \cap \mathcal{B}_i.
\tag{8-11}
\]
It can be proved that there exists a subset $\mathcal{D}_i$ of $\mathcal{C}_i$ and a family $(R_i,j)_{j \in \mathcal{D}_i}$ of positive real numbers such that the two following assertions hold true: for any $j, k \in \mathcal{D}_i$, $j \neq k$,
\[
d_g(x_{j,a}, x_{k,a}) \to +\infty
\tag{8-12}
\]
as $a \to +\infty$, and for any $j \in \mathcal{C}_i$ there exists a unique $k \in \mathcal{D}_i$ such that
\[
\limsup_{a \to +\infty} \frac{d_g(x_{j,a}, x_{k,a})}{s_{k,i,a}} \leq \frac{R_{i,k}}{20} \quad \text{and} \quad \limsup_{a \to +\infty} s_{k,i,a} \leq \frac{R_{i,k}}{20}.
\tag{8-13}
\]
We also introduce the subsets
\[
\Omega_{i,a} = B_{x_i}(\delta_r r_{i,a}) \setminus \bigcup_{j \in \mathcal{D}_i} \Omega_{i,j,a}
\tag{8-14}
\]
of $M$, where
\[
\Omega_{i,j,a} = B_{x_j}(R_i s_{j,i,a})
\tag{8-15}
\]
for all $j \in \mathcal{D}_i$. The $\Omega_{i,j,a}$’s are disjoint for $\alpha$ sufficiently large.

We now prove two lemmas to be used in the proof of Theorem 0.1.

**Lemma 8.1.** Let $i \in \{1, \ldots, N\}$. Up to passing to a subsequence,
\[
|\mathcal{U}_a - \Lambda_i B_{i,a}| = o(B_{i,a}) + O\left(\mu_i^{(n/2)} r_{i,a}^2 - \sum_{j \in \mathcal{D}_i} B_{j,a}\right) = O(B_{i,a})
\]
in $B_{x_i}(4\delta_r r_{i,a}) \setminus \bigcup_{j \in \mathcal{D}_i} B_{x_j}(\frac{1}{10} R_i s_{j,i,a})$, and so, in particular, in $\Omega_{i,a}$.

**Proof.** Let $x_a \in B_{x_i}(4\delta_r r_{i,a}) \setminus \bigcup_{j \in \mathcal{D}_i} B_{x_j}(\frac{1}{10} R_i s_{j,i,a})$. Thanks to Proposition 6.1 we can write
\[
\mathcal{U}_a(x_a) = \mathcal{U}_\infty(x_a) + \varepsilon_a \|\mathcal{U}_\infty\| + O\left(\mu_i^{(n/2)} \right) + \sum_{j=1}^{N} (\Lambda_j + o(1)) B_{j,a}(x_a).
\tag{8-16}
\]
By the definition of $r_{i,a}$, we know that $r_{i,a}^2 \leq \mu_i a$ if $\mathcal{U}_\infty \equiv 0$ so that
\[
\mathcal{U}_\infty(x_a) + \varepsilon_a \|\mathcal{U}_\infty\| = \mu_i^{(n/2)} r_{i,a}^2 - \sum_{j=1}^{N} (\Lambda_j + o(1)) B_{j,a}(x_a).
\tag{8-17}
\]
We now estimate $B_{j,a}(x_a)$. Assume first that $j \notin \mathcal{C}_i$ and $j \neq i$. As one can check with a little bit of work from the above definitions, if $r_{i,a} \to 0$ as $\alpha \to +\infty$, then

$$B_{j,a}(x_a) = \mu_{i,a}^{(n-2)/2} r_{i,a}^{2-n} \Lambda_{i,j,a},$$

(8-18)

where

$$\Lambda_{i,j,a} = \begin{cases} \left( \frac{n(n-2)}{|z-z_{i,j}|^2} \frac{\mu_{i,a}}{\mu_{l,a}} \right)^{(n-2)/2} + o(1) & \text{if } j \in \mathcal{A}_i \cap \mathcal{B}_i \text{ and } i \in \mathcal{A}_j, \\
\frac{r_{i,a}^{n-2}}{s_{i,j,a}} + o(1) & \text{if } j \in \mathcal{A}_i \setminus \mathcal{B}_i \text{ or } j \in \mathcal{A}_i \cap \mathcal{B}_i \text{ and } i \notin \mathcal{A}_j, \\
o(1) & \text{if } j \in \mathcal{A}_i^c \cap \mathcal{C}_i, \end{cases}$$

where, up to a subsequence,

$$z = \lim_{\alpha \to +\infty} r_{i,a}^{-1} \exp_{x_{i,a}}^{-1}(x_a).$$

Note that $z_{i,j} \neq 0$ if $j \in \mathcal{A}_i \cap \mathcal{B}_i$ and $i \in \mathcal{A}_j$. This is a direct consequence of the definition of the $s_{i,j,a}$’s and (8-6). Moreover, $|z - z_{i,j}| \geq 6\delta_i$ in this case. As a consequence we have proved that

$$\mathcal{U}_a(x_a) = O\left( \mu_{j,a}^{(n-2)/2} + o\left( \mu_{i,a}^{(n-2)/2} r_{i,a}^{2-n} \right) + \Lambda_i + o(1) \right) B_{i,a}(x_a)$$

$$+ \mu_{i,a}^{(n-2)/2} r_{i,a}^{2-n} \Lambda(1)_{i,a} + \mu_{i,a}^{(n-2)/2} r_{i,a}^{2-n} \sum_{j \in \mathcal{A}_i} \Lambda(2)_{i,j,a} \Lambda_j + \sum_{j \in \mathcal{C}_i} (\Lambda_j + o(1)) B_{j,a}(x_a),$$

(8-19)

where

$$\Lambda(1)_{i,a} = \begin{cases} 0 & \text{if } \mathcal{U}_\infty \equiv 0, \\
\left( \lim_{\alpha \to +\infty} r_{i,a}^{-1} \mu_{i,a}^{1-(n/2)} \right) \mathcal{U}_\infty(x_i) & \text{if } \mathcal{U}_\infty \not\equiv 0, \end{cases}$$

and

$$\Lambda(2)_{i,j,a} = \begin{cases} \left( \frac{n(n-2)}{|z-z_{i,j}|^{n-2}} \right)^{\frac{n(n-2)}{2}} & \text{if } j \in \mathcal{B}_i \text{ and } i \in \mathcal{A}_j, \\
\lim_{\alpha \to +\infty} r_{i,a}^{n-2} / s_{i,j,a}^{n-2} & \text{if } j \notin \mathcal{B}_i \text{ or } i \notin \mathcal{A}_j. \end{cases}$$

Let $j \in \mathcal{C}_i$. We claim that, up to a subsequence,

$$\lim_{\alpha \to +\infty} \left( \frac{B_{j,a}(x_a)}{B_{i,a}(x_a)} \right)^{2/(n-2)} = n(n-2) \lim_{\alpha \to +\infty} \frac{s_{j,a}^2}{d_g(x_{j,a}, x_a)^2}.$$  

(8-20)

To prove (8-20), we first remark that $i \in \mathcal{A}_j$ since $j \in \mathcal{C}_i$ (and in particular $j \notin \mathcal{A}_i$). Thus, using (8-5), we obtain that

$$\left( \frac{B_{j,a}(x_a)}{B_{i,a}(x_a)} \right)^{2/(n-2)} = (1 + o(1)) \mu_{j,a} \mu_{i,a} d_g(x_{j,a}, x_a)^2 (n-2) \mu_{l,a}^2 + d_g(x_{i,a}, x_a)^2$$

$$= n(n-2) \frac{s_{j,a}^2}{d_g(x_{j,a}, x_a)^2} + o(1) + O\left( \frac{\mu_{j,a} \left| d_g(x_{i,a}, x_a)^2 - d_g(x_{i,a}, x_{j,a})^2 \right|}{d_g(x_{j,a}, x_a)^2} \right).$$

From the triangle inequality, we easily get

$$\frac{d_g(x_{i,a}, x_a)^2 - d_g(x_{i,a}, x_{j,a})^2}{d_g(x_{j,a}, x_a)^2} \leq 1 + 2 \frac{d_g(x_{i,a}, x_{j,a})}{d_g(x_{j,a}, x_a)}$$

$$\leq O(1) + O \left( \frac{s_{j,a}}{d_g(x_{j,a}, x_a)} \sqrt{\frac{\mu_{i,a}}{\mu_{j,a}}} \right),$$

hence the estimate (8-20). Now, for $j \in \mathcal{C}_i$, we let $k \in \mathcal{D}_j$ be given by (8-13). By (8-20) it is easily checked that

$$B_{j,a}(x_a) = O(B_{k,a}(x_a)).$$

(8-21)
Since
\[
\mu^{(n-2)/2}r_{i,a}^{2-n} = O(B_{i,a}(x_a)),
\]
the first estimate in the lemma clearly holds true thanks to (8-19) and (8-21). Here it can be noted that
\[
\mu^{(n-2)/2} = O(\mu^{(n-2)/2}r_{i,a}^{2-n})
\]
for all \(i\). Applying (8-20) again we easily obtain the second estimate in the lemma. This ends the proof of Lemma 8.1. \(\square\)

Now we prove that the following elliptic type lemma holds true. Lemma 8.2 provides estimates on the \(\mathcal{U}_a\)'s and \(\nabla \mathcal{U}_a\)'s in small regions around the blow-up points \(x_i,a\).

**Lemma 8.2.** There exists \(C > 0\) such that, up to a subsequence,
\[
|\mathcal{U}_a| \leq C\mu^{(n-2)/2}r_{i,a}^{2-n} \quad \text{and} \quad |\nabla \mathcal{U}_a| \leq C\mu^{(n-2)/2}r_{i,a}^{1-n}
\]
in \(B_{\delta_i,a}(k\mathcal{U}_a) \setminus B_{\delta_i,a}(\frac{1}{2} \delta_i r_{i,a})\). There also exists \(C > 0\) such that, up to a subsequence, for any \(j \in \mathcal{D}_i\),
\[
|\mathcal{U}_a| \leq C\mu^{(n-2)/2}s_{j,i,a}^{2-n} \quad \text{and} \quad |\nabla \mathcal{U}_a| \leq C\mu^{(n-2)/2}s_{j,i,a}^{1-n}
\]
in \(B_{s_j,a}(5R_{i,j}s_{j,i,a}) \setminus B_{s_j,a}(\frac{1}{5}R_{i,j}s_{j,i,a})\).

**Proof.** The lemma follows from standard elliptic theory and the estimates we proved in Lemma 8.1. Assuming first that \(x_a \in B_{\delta_i,a}(4\delta_i r_{i,a}) \setminus B_{\delta_i,a}(\frac{1}{4} \delta_i r_{i,a})\), we easily get from Lemma 8.1 that
\[
|\mathcal{U}_a(x_a)| = O(\mu^{(n-2)/2}r_{i,a}^{2-n}).
\]
On the other hand, if we let \(\mathcal{U}_a\) be given by \(\mathcal{U}_a(x) = r_{i,a}^{(n-2)/2}\mathcal{U}_a(\exp_{x_i,a}(r_{i,a}x))\), then
\[
\Delta \mathcal{U}_a + \mathcal{U}_a + r_{i,a}^2 - 2\mathcal{U}_a = |\mathcal{U}_a|^{2^* - 2}\mathcal{U}_a,
\]
where \(\mathcal{U}_a = (\exp_{x_i,a}^* g)(r_{i,a}x)\) and \(\mathcal{A}_a(x) = A_\alpha(\exp_{x_i,a}(r_{i,a}x))\). The first two estimates in Lemma 8.2 follow from (8-23) and (8-24) by standard elliptic theory. Similarly, if we assume that
\[
x_a \in B_{s_j,a}(10R_{i,j}s_{j,i,a}) \setminus B_{s_j,a}(\frac{1}{10}R_{i,j}s_{j,i,a}),
\]
noting that \(s_j,i,a = o(r_{i,a})\) in this case, we get from Lemma 8.1 and (8-20) that
\[
|\mathcal{U}_a(x_a)| = O(\mu^{(n-2)/2}s_{j,i,a}^{2-n}).
\]
Letting \(\hat{\mathcal{U}}_a\) be given by \(\hat{\mathcal{U}}_a(x) = s_{j,i,a}^{(n-2)/2}\mathcal{U}_a(\exp_{x_j,a}(s_{j,i,a}x))\), we also have
\[
\Delta \hat{\mathcal{U}}_a + \hat{\mathcal{U}}_a + s_{j,i,a}^2 - 2\hat{\mathcal{U}}_a = |\hat{\mathcal{U}}_a|^{2^* - 2}\hat{\mathcal{U}}_a,
\]
where \(\mathcal{U}_a = (\exp_{x_j,a}^* g)(s_{j,i,a}x)\) and \(\mathcal{A}_a(x) = A_\alpha(\exp_{x_j,a}(s_{j,i,a}x))\). The last two estimates in Lemma 8.2 follow from (8-25) and (8-26) here again by standard elliptic theory. This proves Lemma 8.2. \(\square\)

9. Sharp asymptotics for the range of influence

Our goal now is to prove the sharp asymptotics connecting the range of influence \(r_{i,a}\) of the blow-up points with the weights \(\mu_{i,a}\) of the bubbles in the decomposition of Proposition 4.2. This is the subject of Proposition 9.2. We adopt here the notations of the preceding section. In particular, \((A_\alpha)_a\) is a sequence...
Lemma 9.1. If \( r_{i,a} = o\left(\sqrt{\mu_{i,a}/\mu_a}\right) \), then, up to a subsequence,
\[
\lambda_{i,a} \left( n(n-2)/2 \right) \mathfrak{g}_a \Rightarrow (n(n-2))^{(n-2)/2}\left(\Lambda_i|z|^2 - \mathfrak{H}_i(z)\right)
\]
in \( C^2_{\text{loc}}(B_0(2\delta_i) \setminus \{0\}) \) as \( \alpha \to +\infty \), where
\[
\mathfrak{H}_i(z) = \sum_{j \in \mathcal{A}_i \cap \mathcal{A}_j} \lambda_{i,j} A_j |z - z_{i,j}|^{n-2} + X_i
\]
is a smooth function in \( B_0(2\delta_i) \) satisfying that \( \mathfrak{H}_i(0) \neq 0 \), the \( \lambda_{i,j} \)'s are as in (8-7), \( \delta_i \) is as in (8-10), and the \( X_i \)'s are nonnegative vectors in \( \mathbb{R}^p \).

Proof. Let \( z \in B_0(3\delta_i) \setminus \{0\} \) and set \( x_a = \exp_{x_{i,a}}(r_{i,a}z) \). Let also \( \mathcal{W}_a \) be given by
\[
\mathcal{W}_a(x) = r_{i,a}^{-1(n-2)/2} \mu_{i,a}^{-1(n-2)/2} \mathcal{U}_a\left(\exp_{x_{i,a}}(r_{i,a}x)\right).
\]
Then
\[
\Delta_{\mathcal{W}_a} \mathcal{U}_a + r_{i,a}^2 \mathcal{A}_a \mathcal{U}_a = \left(\frac{\mu_{i,a}}{r_{i,a}}\right)^2 |\mathcal{U}_a|^{2-2} \mathcal{W}_a,
\]
where \( g_a = (\exp_{x_{i,a}}^* \mathcal{g})(r_{i,a}x) \) and \( \mathcal{A}_a(x) = A_a(\exp_{x_{i,a}}(r_{i,a}x)) \). In particular, we get by (8-6), (8-19) and (8-20) that, if \( r_{i,a}^2 = o(\mu_{i,a}/\mu_a) \), then
\[
\lim_{a \to +\infty} r_{i,a}^{-n-2} \mu_{i,a}^{(n-2)/2} \mathcal{U}_a(x_a) = (n(n-2))^{(n-2)/2}\left(\Lambda_i|z|^2 - \mathfrak{H}_i(z)\right),
\]
where \( \mathfrak{H}_i(z) \) is the sum of two terms:
\[
\begin{cases}
0 & \text{if } \mathcal{U}_a(x) \equiv 0 \\
\left(\lim_{a \to +\infty} r_{i,a}^{-n-2} \mu_{i,a}^{1-(n/2)}\right) \mathcal{U}_a(x) & \text{if } \mathcal{U}_a(x) \not\equiv 0
\end{cases}
\]
and
\[
\sum_{j \in \mathcal{A}_j} \lambda_j \begin{cases}
(n(n-2))^{(n-2)/2} \lambda_{i,j}/|z - z_{i,j}|^{n-2} & \text{if } j \in \mathcal{B}_i \text{ and } i \in \mathcal{A}_j,

\lim_{a \to +\infty} r_{i,a}^{-n-2} \mu_{i,a}^{1-(n/2)} & \text{if } j \not\in \mathcal{B}_i \text{ or } i \not\in \mathcal{A}_j.
\end{cases}
\]
As a remark, if \( j \in \mathcal{A}_i \) and \( i \in \mathcal{A}_j \), then \( \mu_{i,a} \sim \mu_{j,a} \). In particular, \( z_{i,j} \neq 0 \) since, if not the case, we would get from the inequality \( r_{i,a} \leq s_{i,j,a} \) that \( r_{i,a} = o(\mu_{i,a}) \) and then that \( d_g(x_{i,a}, x_{j,a}) = o(\mu_{i,a}) \), a contradiction with the first equation in (4-5) of Proposition 4.2. By (9-1) and (9-2), standard elliptic theory gives the lemma, up to the proof that \( \mathfrak{H}_i(0) \neq 0 \). Assume first that there exists \( j \in \mathcal{A}_i \) such that \( s_{i,j,a} = r_{i,a} \). Then in the term involving this \( j \) in the above sum over \( \mathcal{A}_i \) there is at least one line which is positive. Since all the other terms are nonnegative, this proves that \( \mathfrak{H}_i(0) \neq 0 \). The other possibility
is that $\mathcal{U}_\infty \neq 0$ and that $r_{i,a}^2 = \mu_{i,a}$ so the first term in the definition of $\mathcal{H}_i$ is nonzero. Indeed, by the maximum principle, since

$$\Delta_g |\mathcal{U}_\infty| + \Lambda |\mathcal{U}_\infty| \geq 0$$

for some $\Lambda > 0$, where $|\mathcal{U}_\infty| = \sum_i u_{i,\infty}$ is the sum of the components of $\mathcal{U}_\infty$, we get that $|\mathcal{U}_\infty| > 0$ in $M$ if $\mathcal{U}_\infty \neq 0$. Then, here again, $\mathcal{H}_i(0) \neq 0$. Noting that the above two possibilities are the only two possibilities since our assumption on $r_{i,a}$ clearly implies that $r_{i,a} \to 0$ as $\alpha \to +\infty$, this ends the proof of Lemma 9.1.

As it can be checked from the above proof, we have an explicit formula for the $X_i$’s in Lemma 9.1. We get that

$$X_i = \left( \lim_{\alpha \to +\infty} r_{i,a}^{n-2} \mu_{i,a}^{-1(n/2)} \right) \mathcal{U}_\infty(x_i) + \sum_{j \in (\mathcal{A}_i ) \cup \Theta_i} \left( \lim_{\alpha \to +\infty} \frac{r_{i,a}}{s_{i,j}} \right) n^{-2} \Lambda_j,$$  \hspace{1cm} (9-3)

where we adopt the convention that the first term in the right-hand side of (9-3) is zero if $\mathcal{U}_\infty \equiv 0$, that the second term is zero if $(\mathcal{A}_i ) \cup \Theta_i = \emptyset$, and where $\Theta_i = \{ j \in \mathcal{A}_i \text{ s.t. } i \notin \mathcal{A}_j \}$. Now, at this point, we can state Proposition 9.2 which establishes sharp asymptotics connecting the range of influence $r_{i,a}$ of the blow-up points $x_{i,a}$ to the weights $\mu_{i,a}$ of the bubbles in the decomposition of Proposition 4.2.

**Proposition 9.2.** Let $(M, g)$ be a smooth compact Riemannian manifold of dimension $n \geq 4$, $p \geq 1$ be an integer, and $(A_\alpha)_{\alpha}$ be a sequence of $C^1$ maps from $M$ to $M^p_\infty(\mathbb{R})$ such that $A_\alpha \to A$ in $C^1(M)$ as $\alpha \to +\infty$ for some $C^1$ map $A$ from $M$ to $M^p_\infty(\mathbb{R})$ satisfying (H). Let also $(\mathcal{U}_\alpha)_{\alpha}$ be an arbitrary bounded sequence in $H^1(M)$ of nonnegative solutions of (1-1) such that $\|\mathcal{U}_\alpha\|_\infty \to +\infty$ as $\alpha \to +\infty$. Let $i \in \{1, \ldots, N\}$ and assume that, up to a subsequence, $r_{i,a} = o(\sqrt{\mu_{i,a}/\mu_a})$. Then

$$\left( (A(x_i) - \frac{1}{6} S_g(x_i) \text{ Id}_p) \Lambda_i + o(1) \right) r_{i,a}^2 \ln \frac{1}{\mu_{i,a}} = 2 \mathcal{H}_i(0) + o(1)$$ \hspace{1cm} (9-4)

if $n = 4$, and

$$\left( (A(x_i) - \frac{n-2}{4(n-1)} S_g(x_i) \text{ Id}_p) \Lambda_i + o(1) \right) \mu_{i,a}^{4-n} r_{i,a}^{n-2} = \frac{n^{n-2}(n-2)^{n-1} \omega_{n-1}}{\int_{\mathbb{R}^n} u_0^2 \, dx} \left( \mathcal{H}_i(0) + \frac{n-4}{2} \langle \Lambda_i, \mathcal{H}_i(0) \rangle_{\mathbb{R}^p} \Lambda_i \right) + o(1) \hspace{1cm} (9-5)$$

if $n \geq 5$, where $\mathcal{H}_i$ is as in Lemma 9.1, the $r_{i,a}$’s are as in (8-3), and $u_0$ is given by (4-3). Moreover, $\langle \Lambda_i, \nabla \mathcal{H}_i(0) \rangle_{\mathbb{R}^p} = 0$.

We prove Proposition 9.2 by reverse induction on $i$. We let $i \in \{1, \ldots, N\}$ be such that $\sqrt{\mu_a} r_{i,a} = o(\sqrt{\mu_{i,a}})$ and, in case $i < N$, we assume that for any $j = i+1, \ldots, N$, (9-4) and (9-5) hold for $j$ if $\sqrt{\mu_a} r_{j,a} = o(\sqrt{\mu_{j,a}})$. (H_i)

If $i = N$ we do not assume anything. Then we aim to prove that (9-4) and (9-5) hold true for $i$. As a remark it should be noted that we always have

$$\mathcal{H}_i(0) + \frac{n-4}{2} \langle \Lambda_i, \mathcal{H}_i(0) \rangle_{\mathbb{R}^p} \Lambda_i \neq 0.$$ \hspace{1cm} (9-6)
Let \( i \in \{1, \ldots, N\}, i < N \), be arbitrary. Assuming \((H_i)\), we get that for any \( j \in \mathcal{D}_i \),

\[
\frac{s_{j,i}^{2-n}}{\mu_{j,i}} = \begin{cases} 
  O(-\ln \mu_{j,i}) & \text{if } n = 4, \\
  O(\mu_{j,i}^{-n}) & \text{if } n \geq 5.
\end{cases} \tag{9-7}
\]

Indeed, if \( j \in \mathcal{D}_i \), then \( j > i \). Moreover, for any \( j \in \mathcal{D}_i \), we have \( i \in \mathcal{D}_j \), so \( s_{j,i} \geq r_{j,i} \), and clearly \( s_{j,i}^2 = o(\mu_{j,a}^{-1}) = o(\mu_{j,a}^{-1}) \). In particular, \( \sqrt{\mu_{j,a}^{2}} = o(\sqrt{\mu_{j,a}^{2}}) \), and (9-7) is a direct consequence of \((H_i)\), thanks to (9-6). Now we prove Proposition 9.2 in several steps. In the sequel we let \( R_i(\alpha) \) represent any quantity such that

\[
R_i(\alpha) = \begin{cases} 
  o(-\mu_{i,a}^2 \ln \mu_{i,a}) & \text{if } n = 4, \\
  o(\mu_{i,a}^2) & \text{if } n \geq 5.
\end{cases} \tag{9-8}
\]

The first step in the proof of Proposition 9.2 is as follows.

**Step 1.** Let \( i \in \{1, \ldots, N\} \) be arbitrary. In case \( i < N \), assume that \((H_i)\) holds true. Let

\[
\mathcal{F}_a = (64\omega_3 ((A(x_i)\Lambda_i, \Lambda_i)_{\mathbb{R}^p} - \frac{1}{8} S_g(x_i))) + o(1) \mu_{i,a}^2 \ln \mu_{i,a} + o(-\mu_{i,a}^2 \ln \mu_{i,a})
\]

if \( n = 4 \), and

\[
\mathcal{F}_a = \left( ((A(x_i)\Lambda_i, \Lambda_i)_{\mathbb{R}^p} - \frac{n-2}{4(n-1)} S_g(x_i)) \int_{\mathbb{R}^n} u_0^2 dx + o(1) \right) \mu_{i,a}^2
\]

if \( n \geq 5 \). Then we have, up to passing to a subsequence,

\[
\mathcal{F}_a = \left( \frac{1}{2} n^{n-2} (n-2)^n \omega_n \Lambda_i, \mathcal{H}_i(0)_{\mathbb{R}^p} + o(1) \right) \mu_{i,a}^{-2} r_{i,a}^{2-n}
\]

if \( \sqrt{\mu_{a} r_{i,a}} = o\left(\sqrt{\mu_{i,a}}\right) \), and \( \mathcal{F}_a = O\left(\mu_{i,a}^{(n-2)/2} \mu_{a}^{(n-2)/2}\right) \) otherwise, where \( \mathcal{H}_i \) is as in Lemma 9.1, the \( r_{i,a}'s \) are as in (8-3), and \( u_0 \) is as in (4-3).

**Proof of Step 1.** We apply the Pohozaev identity (7-2) of Proposition 7.1 in Section 7 to \( u_a \) in \( \Omega_{i,a} \) with \( X = X^{\alpha} \) given by

\[
X^{\alpha}(x) = \left( 1 - \frac{1}{6(n-1)} R^{\alpha}_g(x) (\nabla f_a(x), \nabla f_a(x)) \right) \nabla f_a(x), \tag{9-9}
\]

where \( f_a(x) = \frac{1}{2} d_g(x_i, x)^2 \), and \( R^{\alpha}_g \) is the \((0, 2)\)-tensor field we get from the \((2, 0)\)-Ricci tensor \( R_c \) due to the musical isomorphism. We obtain

\[
\int_{\Omega_{i,a}} (A_a u_a, X^\alpha(\nabla u_a))_{\mathbb{R}^p} dv_g \\
+ \frac{n-2}{4n} \int_{\Omega_{i,a}} (\Delta_g (\div_g X^\alpha)) |u_a|^2 dv_g + \frac{n-2}{2n} \int_{\Omega_{i,a}} (\div_g X^\alpha)(A_u u_a, u_a)_{\mathbb{R}^p} dv_g \\
= Q_a - \sum_{j \in \mathcal{D}_i} Q^j_a + R_{i,a} + R_{2,a} - \sum_{j \in \mathcal{D}_i} R^j_{2,a}, \tag{9-10}
\]
where, if $v = v_\alpha$ stands for the unit outer normal to $\partial B_{x_i,a}(\delta_i r_{i,a})$, the $Q_a$’s are given by
\[
Q_a = \frac{n-2}{2n} \int_{\partial B_{x_i,a}(\delta_i r_{i,a})} (\text{div}_g X^\alpha)(\nabla_{\alpha} u_\alpha, u_\alpha)_{\mathbb{R}^p} d\sigma_g \\
- \int_{\partial B_{x_i,a}(\delta_i r_{i,a})} \left( \frac{1}{2} X^\alpha(v) |\nabla u_\alpha|^2 \right) d\sigma_g,
\]
and the $Q_a^j$’s are given by
\[
Q_a^j = \frac{n-2}{2n} \int_{\partial B_{x_i,a}(\delta_i r_{i,a})} (\text{div}_g X^\alpha)(\nabla_{\alpha} u_\alpha, u_\alpha)_{\mathbb{R}^p} d\sigma_g \\
- \int_{\partial B_{x_i,a}(\delta_i r_{i,a})} \left( \frac{1}{2} X^\alpha(v) |\nabla u_\alpha|^2 \right) d\sigma_g,
\]
where $\Omega_{i,j,a}$ is as in (8-15), the $R_{1,a}$’s are given by
\[
R_{1,a} = - \int_{\partial \Omega_{i,a}} (\nabla_{\alpha} u_\alpha)_{\mathbb{R}^p} d\nu_g,
\]
where $(T_v X)_\alpha = \sum_{i=1}^p S_X^i (\nabla u_i, \nabla u_i)$ and $S_X$ is as in (7-1), the $R_{2,a}$’s are given by
\[
R_{2,a} = \frac{n-2}{2n} \int_{\partial B_{x_i,a}(\delta_i r_{i,a})} X^\alpha(v) |\nabla u_\alpha|^2 d\sigma_g - \frac{n-2}{4n} \int_{\partial B_{x_i,a}(\delta_i r_{i,a})} (\nabla_{\alpha} (\text{div}_g X^\alpha))(\nabla u_\alpha)_{\mathbb{R}^p} d\sigma_g,
\]
and the $R_{2,a}^j$’s are given by
\[
R_{2,a}^j = \frac{n-2}{2n} \int_{\partial \Omega_{i,j,a}} X^\alpha(v) |\nabla u_\alpha|^2 d\sigma_g - \frac{n-2}{4n} \int_{\partial \Omega_{i,j,a}} (\nabla_{\alpha} (\text{div}_g X^\alpha))(\nabla u_\alpha)_{\mathbb{R}^p} d\sigma_g.
\]
Note that $\partial_i = \emptyset$ if $i = N$. Thanks to the expression of the $X^\alpha$’s in (9-9) we have the estimates
\[
|X^\alpha(x)| = O(d_g(x_{i,a}, x)), \\
\text{div}_g X^\alpha(x) - n = O(d_g(x_{i,a}, x)^2), \\
|\nabla (\text{div}_g X^\alpha)(x)| = O(d_g(x_{i,a}, x)), \\
\Delta_g (\text{div}_g X^\alpha)(x) = \frac{n}{n-1} S_g(x_{i,a}) + O(d_g(x_{i,a}, x)).
\]
In what follows we estimate the different terms involved in (9-10). We start with estimates on the $Q_a^j$’s and $R_{2,a}^j$’s in (9-12) and (9-15). Since
\[
d_g(x_{i,a}, x) \leq d_g(x_{i,a}, x_{j,a}) + R_{i,j,s_j,i,a} = O\left( \sqrt{\frac{\mu_{i,a}}{\mu_{j,a}}} \frac{1}{r_{i,a}} \right)
\]
on $\partial \Omega_{i,j,a}$, we obtain from Lemma 8.2, (9-7) and (9-16) that
\[
Q_a^j + R_{2,a}^j = O\left( \frac{1}{\mu_{i,a}^{n-2}} \right) = R_I(\alpha),
\]
where $R_I(\alpha)$ is as in (9-8). Now we estimate the $R_{2,a}$’s in (9-14). Still from Lemma 8.2, we obtain by direct computations, using (8-6) and (9-16), that
\[
R_{2,a} = O\left( \mu_{i,a}^{n-2} \right) + O\left( \mu_{i,a}^{n-2} r_{i,a}^{2-n} \right).
\]
Concerning the right-hand side of (9-10) it remains to estimate the $Q_a$’s in (9-11) and the $R_{1,a}$’s in (9-13). We start with estimates for the $R_{1,a}$’s. We remark that $S^4_{X^a}$ is $O(d_g(x_{i,a}, x)^2)$ and that
\[
(T^a_X x^a)_{\mathbb{H}_0} = O(d_g(x_{i,a}, x)^3 |\nabla B_{i,a}|^2).
\]
In particular, we can write
\[
R_{1,a} = O\left(\int_{\Omega_{i,a}} d_g(x_{i,a}, x)^2 |\nabla B_{i,a}|^2 dv_g\right) + O\left(\int_{\Omega_{i,a}} d_g(x_{i,a}, x)^2 |\nabla B_{i,a}| |\nabla (u^a - B_{i,a} \Lambda_i)| dv_g\right) + O\left(\int_{\Omega_{i,a}} d_g(x_{i,a}, x)^2 |\nabla (u^a - B_{i,a} \Lambda_i)|^2 dv_g\right).
\]
Direct computations lead to
\[
\int_{\Omega_{i,a}} d_g(x_{i,a}, x)^2+\kappa |\nabla B_{i,a}|^2 dv_g = \begin{cases} O_\kappa (-\mu_{i,a}^2 \ln \mu_{i,a}) & \text{if } n = 4, \\
O_\kappa (\mu_{i,a}^2) & \text{if } n \geq 5,
\end{cases}
\]
where $O_\kappa = O$ if $\kappa = 0$, and $O_\kappa = o$ if $\kappa = 1$. Integrating by parts and using Lemma 8.1, Lemma 8.2, and (9-7), we can write
\[
\int_{\Omega_{i,a}} d_g(x_{i,a}, x)^2 |\nabla (u^a - B_{i,a} \Lambda_i)|^2 dv_g
= O\left(\int_{\partial \Omega_{i,a}} |u^a - B_{i,a} \Lambda_i| d_g(x_{i,a}, x)^2 |\nabla (u^a - B_{i,a} \Lambda_i)| d\sigma_g\right) + O\left(\int_{\partial \Omega_{i,a}} d_g(x_{i,a}, x)^2 |u^a - B_{i,a} \Lambda_i|^2 d\sigma_g\right) + O\left(\int_{\Omega_{i,a}} d_g(x_{i,a}, x)^2 |u^a - B_{i,a} \Lambda_i|^2 dv_g\right) + O\left(\int_{\Omega_{i,a}} d_g(x_{i,a}, x)^2 (u^a - B_{i,a} \Lambda_i, \Delta_g (u^a - B_{i,a} \Lambda_i))_{\mathbb{R}^p} dv_g\right),
\]
and then
\[
\int_{\Omega_{i,a}} d_g(x_{i,a}, x)^2 |\nabla (u^a - B_{i,a} \Lambda_i)|^2 dv_g
= \int_{\Omega_{i,a}} d_g(x_{i,a}, x)^2 |u^a - B_{i,a} \Lambda_i, \Delta_g (u^a - B_{i,a} \Lambda_i)|_{\mathbb{R}^p} dv_g + o(\mu_{i,a}^{-2} r_{i,a}^{-2-n}) + R_1(\alpha),
\]
where $R_1(\alpha)$ is as in (9-8). It remains to remark that thanks to the equations satisfied by the $u^a$’s, and the expression of $\Delta_g$ in geodesic polar coordinates, we have
\[
\int_{\Omega_{i,a}} d_g(x_{i,a}, x)^2 |u^a - B_{i,a} \Lambda_i, \Delta_g (u^a - B_{i,a} \Lambda_i)|_{\mathbb{R}^p} dv_g
= O\left(\int_{\Omega_{i,a}} d_g(x_{i,a}, x)^2 |u^a - B_{i,a} \Lambda_i| (|u^a|^{2^*-1} + B_{i,a}^{2^*-1}) dv_g\right) + O\left(\int_{\Omega_{i,a}} d_g(x_{i,a}, x)^2 |u^a - B_{i,a} \Lambda_i| dv_g\right) + O\left(\int_{\Omega_{i,a}} d_g(x_{i,a}, x)^3 |u^a - B_{i,a} \Lambda_i| |\nabla B_{i,a}| dv_g\right),
\]
so that, by Lemma 8.1, using Hölder’s inequalities,
\[
R_{1,a} = o(\mu_{i,a}^{-2} r_{i,a}^{-2-n}) + R_1(\alpha),
\]
where \( R_t(\alpha) \) is as in (9-8). Still concerning the right-hand side of (9-10) it remains to estimate the \( Q_\alpha \)'s in (9-11). Thanks to Lemma 8.2 and Lemma 9.1, we get by simple computations that

\[
Q_\alpha = \left( -\frac{1}{2} n^{n-2} (n-2)^n \omega_{n-1} \left( \Lambda_{i, \alpha} \right)_{\mathbb{H}^n} + o(1) \right) \mu_{i, \alpha}^{n-2} \mu_1^{2-n} + O(\mu_{i, \alpha}^{n-2}),
\]

(9-20)

if \( r_{i, \alpha} = o(\sqrt{\mu_{i, \alpha} / \mu_1}) \), and \( Q_\alpha = O(\mu_{i, \alpha}^{(n-2)/2} \mu_1^{(n-2)/2}) \) otherwise. Now we concentrate on the left-hand side of (9-10). Writing \( A_\alpha(x) = A_\alpha(x_{i, \alpha}) + O(\mu_{i, \alpha} x_{i, \alpha}) \), we get

\[
\int_{\Omega_{i, \alpha}} \left\{ A_\alpha \partial_\alpha (\nabla \partial_\alpha) \right\} \partial_\alpha d\nu_g = \sum_{j, k=1}^p A_{j k}^\alpha \left( \int_{\Omega_{i, \alpha}} u_{j, \alpha}(\nabla \partial_\alpha) \partial_\alpha d\nu_g \right) + O(\int_{\Omega_{i, \alpha}} d_g(x_{i, \alpha}, x)^2 |\partial_\alpha| \partial_\alpha d\nu_g).
\]

Using the Cauchy–Schwarz inequality, we can write

\[
\int_{\Omega_{i, \alpha}} d_g(x_{i, \alpha}, x)^2 |\partial_\alpha| \partial_\alpha d\nu_g \leq \Pi_{j=0}^1 \left( \int_{\Omega_{i, \alpha}} d_g(x_{i, \alpha}, x)^{3-2j} |\nabla^{1-j} \partial_\alpha|^2 d\nu_g \right)^{1/2}.
\]

Using Lemma 8.1 it is easily checked that

\[
\int_{\Omega_{i, \alpha}} d_g(x_{i, \alpha}, x)|\partial_\alpha|^2 d\nu_g = R_t(\alpha),
\]

(9-21)

where \( R_t(\alpha) \) is as in (9-8). We integrate by parts and use the equations satisfied by the \( \partial_\alpha \)'s, together with Lemma 8.1, Lemma 8.2, and (9-7), to obtain

\[
\int_{\Omega_{i, \alpha}} d_g(x_{i, \alpha}, x)^3 |\nabla \partial_\alpha|^2 d\nu_g = O(\int_{\Omega_{i, \alpha}} d_g(x_{i, \alpha}, x)^3 |\nabla \partial_\alpha| \partial_\alpha d\nu_g)
\]

\[
+ O(\int_{\Omega_{i, \alpha}} d_g(x_{i, \alpha}, x)^2 |\partial_\alpha|^2 d\nu_g) + O\left( \int_{\Omega_{i, \alpha}} d_g(x_{i, \alpha}, x)^3 |\partial_\alpha|^2 d\nu_g \right)
\]

\[
+ O\left( \int_{\Omega_{i, \alpha}} d_g(x_{i, \alpha}, x)|\partial_\alpha|^2 d\nu_g \right),
\]

and then that

\[
\int_{\Omega_{i, \alpha}} d_g(x_{i, \alpha}, x)^3 |\nabla \partial_\alpha|^2 d\nu_g = o(\mu_{i, \alpha}^{n-2} r_{i, \alpha}^{2-n}) + R_t(\alpha),
\]

where \( R_t(\alpha) \) is as in (9-8). Thus we get that

\[
\int_{\Omega_{i, \alpha}} (A_\alpha \partial_\alpha, X^\alpha (\nabla \partial_\alpha))_{\mathbb{H}^n} d\nu_g = \sum_{j, k=1}^p A_{j k}^\alpha \left( \int_{\Omega_{i, \alpha}} u_{j, \alpha}(\nabla \partial_\alpha) \partial_\alpha d\nu_g \right) + o(\mu_{i, \alpha}^{n-2} r_{i, \alpha}^{2-n}) + R_t(\alpha).
\]

Integrating by parts again, and estimating the different terms as above, it is easily checked that we actually have

\[
\int_{\Omega_{i, \alpha}} (A_\alpha \partial_\alpha, X^\alpha (\nabla \partial_\alpha))_{\mathbb{H}^n} d\nu_g = -\frac{n}{2} \sum_{j, k=1}^p A_{j k}^\alpha \left( \int_{\Omega_{i, \alpha}} u_{j, \alpha} \partial_\alpha u_{k, \alpha} d\nu_g \right) + o(\mu_{i, \alpha}^{n-2} r_{i, \alpha}^{2-n}) + R_t(\alpha),
\]
where $R_t(\alpha)$ is as in (9-8). Proceeding as above, thanks to (9-16), one finally gets that

$$
\begin{align*}
\int_{\Omega_{\alpha}} \{ A_{\alpha} \partial_{\alpha} + X^a (\nabla \partial_{\alpha}) \} d v_g + &n - 2 \int_{\Omega_{\alpha}} \frac{\Delta_g (\text{div}_g X^a)}{4n} \{ \partial_{\alpha} \}^2 d v_g \\
+ &\frac{n - 2}{2n} \int_{\Omega_{\alpha}} \text{div}_g X^a (A_{\alpha} \partial_{\alpha}, \partial_{\alpha}) d v_g \\
= &- \sum_{j,k=1}^p A_{j,k} (x_{i_1}, \alpha) \int_{\Omega_{\alpha}} u_j u_{k,a} d v_g + \frac{n - 2}{4(n - 1)} S_g (x_{i_1}) \int_{\Omega_{\alpha}} |\partial_{\alpha}|^2 d v_g + o (\mu_{i,a}^{-2} r_{i,a}^{2-n}) + R_t(\alpha),
\end{align*}
$$

(9-22)

where $R_t(\alpha)$ is as in (9-8). We have

$$
\int_{\Omega_{\alpha}} B_{i,a}^2 d v_g = R_t(\alpha) \quad \text{for all } j \in \mathcal{D}_i.
$$

(9-23)

Indeed, if $d_g (x_{i_1}, x_{j_i}) / s_{j_i} \to +\infty$ as $\alpha \to +\infty$, then

$$
\int_{B_{j,a} (R_{i,j}, s_{j_i})} B_{i,a}^2 d v_g = O (s_{j_i}^n B_{i,a} (x_{j_i})^2) = O \left( \mu_{j,a}^{-2} s_{j_i}^{4-n} \right) = R_t(\alpha),
$$

thanks to (9-7), and if $d_g (x_{i_1}, x_{j_i}) = O (s_{j_i})$, then $s_{j_i} = o (\mu_{i,a})$ and

$$
\int_{B_{j,a} (R_{i,j}, s_{j_i})} B_{i,a}^2 d v_g = O (\mu_{i,a}^{-2} s_{j_i}^n) = o (\mu_{i,a}^2).
$$

Clearly, (9-23) follows from these two equations. Plugging (9-23) into (9-22), we get from Lemma 8.1 that

$$
\int_{\Omega_{\alpha}} \{ A_{\alpha} \partial_{\alpha} + X^a (\nabla \partial_{\alpha}) \} d v_g + \frac{n - 2}{4n} \int_{\Omega_{\alpha}} \frac{\Delta_g (\text{div}_g X^a)}{4n} \{ \partial_{\alpha} \}^2 d v_g + \frac{n - 2}{2n} \int_{\Omega_{\alpha}} \text{div}_g X^a (A_{\alpha} \partial_{\alpha}, \partial_{\alpha}) d v_g

= - \left( A(x_i) \Lambda_i - \frac{1}{6} S_g (x_i) \Lambda_i + o(1) \right) \int_{B_{j,a} (R_{i,j}, \rho_{j_i})} B_{i,a}^2 d v_g + o (\mu_{i,a}^{-2} r_{i,a}^{2-n}) + R_t(\alpha).
$$

(9-24)

We have

$$
\int_{B_{j,a} (R_{i,j}, \rho_{j_i})} B_{i,a}^2 d v_g = \begin{cases} 
64 \omega_3 \mu_{i,a}^2 \ln (r_{i,a} / \mu_{i,a}) + o (-\mu_{i,a}^2 \ln \mu_{i,a}) & \text{if } n = 4, \\
(\int_{\mathbb{R}^n} u_0^2 dx) \mu_{i,a}^2 + o (\mu_{i,a}^2) & \text{if } n \geq 5,
\end{cases}
$$

(9-25)

where $u_0$ is given by (4-3). Combining (9-10), (9-17)–(9-20), (9-24), and (9-25) yields the proof of Step 1. \qed

**Step 2.** Let $i \in \{1, \ldots, N\}$ be arbitrary. In case $i < N$, assume that $(H_i)$ holds. Let $\mathcal{K}_a$ be given by

$$
\mathcal{K}_a = \left( A(x_i) \Lambda_i - \frac{1}{6} S_g (x_i) \Lambda_i + o(1) \right) \mu_{i,a}^2 \ln \frac{r_{i,a}}{\mu_{i,a}} + o (-\mu_{i,a}^2 \ln \mu_{i,a})
$$

in case $n = 4$, and

$$
\mathcal{K}_a = \left( A(x_i) \Lambda_i - \frac{n - 2}{4(n - 1)} S_g (x_i) \Lambda_i \int_{\mathbb{R}^n} u_0^2 dx + o(1) \right) \mu_{i,a}^2
$$

in case $n \geq 5$.}\]
in case \( n \geq 5 \). Then, up to passing to a subsequence, we have

\[
\mathcal{H}_\alpha = \left( n^{n-2}(n-2)^{n-1} \omega_{n-1} \left( \mathcal{H}_i(0) + \frac{n-4}{2} \left( \mathcal{H}_i(0), \Lambda_i \right) \right) + o(1) \right) \mu_{i,a}^{n-2} r_{i,a}^{2-n},
\]

if \( \sqrt{\mu_a r_{i,a}} = o(\sqrt{\mu_i}), \) and \( \mathcal{H}_\alpha = O \left( \mu_{i,a}^{(n-2)/2} \mu_a^{(n-2)/2} \right) \) otherwise, where \( \mathcal{H}_i \) as in Lemma 9.1, the \( r_{i,a}'s \) are as in (8-3), and \( u_0 \) is as in (4-3).

**Proof of Step 2.** We multiply the line \( k \) of the system (1-1) by \( u_{i,a} \) and integrate over \( \Omega_{i,a} \). This leads to

\[
\int_{\Omega_{i,a}} u_{i,a} \Delta_g u_{k,a} dv_g + \sum_{m=1}^p \int_{\Omega_{i,a}} A_{km}^a u_{l,a} u_{m,a} dv_g = \int_{\Omega_{i,a}} \left| u_a \right|^2 r_{k,a} u_{i,a} dv_g. \tag{9-26}
\]

Let the \( \Lambda_{i,k}'s \), \( k = 1, \ldots, p \), be the components of \( \Lambda_i \), and the \( \mathcal{H}_{i,k}'s \) be the components of \( \mathcal{H}_i \). We define \( S_{k,l}^a \) by

\[
S_{k,l}^a = \left( n^{n-2}(n-2)^{n-1} \omega_{n-1} (\Lambda_{k,i} \mathcal{H}_{i,k}(0) - \Lambda_{i,j} \mathcal{H}_{i,k}(0)) + o(1) \right) \mu_{i,a}^{2-n} r_{i,a}^{2-n},
\]

if \( r_{i,a} = o(\sqrt{\mu_i}) \), and \( S_{k,l}^a = O \left( \mu_{i,a}^{(n-2)/2} \mu_a^{(n-2)/2} \right) \) otherwise. We also define \( T_{k,l}^a \) by

\[
T_{k,l}^a = \begin{cases} 
(64 \omega_3 W_{k,l} + o(1)) \mu_{i,a}^2 \ln \left( \frac{r_{i,a}}{\mu_i} \right) + o \left( - \mu_{i,a}^2 \ln \mu_{i,a} \right) & \text{if } n = 4, \\
(W_{k,l} \int_{\mathbb{R}^n} u_{i,a}^2 dx + o(1)) \mu_{i,a}^2 & \text{if } n \geq 5,
\end{cases}
\]

where

\[
W_{k,l} = \sum_{m=1}^p \left( A(x_i)_{lm} \Lambda_{i,k} \Lambda_{i,m} - A(x_i)_{km} \Lambda_{i,j} \Lambda_{i,m} \right),
\]

and \( u_0 \) is given by (4-3). Integrating by parts, thanks to Lemma 8.2 and Lemma 9.1, we have

\[
\int_{\Omega_{i,a}} u_{i,a} \Delta_g u_{k,a} dv_g = \int_{\Omega_{i,a}} u_{k,a} \Delta_g u_{i,a} dv_g + \int_{\partial \Omega_{i,a}} \left( u_{k,a} \partial_{\nu} u_{i,a} - u_{i,a} \partial_{\nu} u_{k,a} \right) d\sigma_g
\]

\[
= \int_{\Omega_{i,a}} \left| u_{a} \right|^2 r_{k,a} u_{i,a} dv_g - \sum_{m=1}^p \int_{\Omega_{i,a}} A_{lm}^a u_{k,a} u_{m,a} dv_g + O \left( \sum_{j \in \mathcal{B}_i} \mu_{j,a}^{n-2} \right) + S_{k,l}^a.
\]

Now we write \( A_a(x) = A_a(x_i,a) + O(d_g(x_i,a,x)) \). With similar estimates as in the proof of Step 1, thanks to (9-21), we get that

\[
\sum_{m=1}^p \int_{\Omega_{i,a}} A_{lm}^a u_{k,a} u_{m,a} dv_g - \sum_{m=1}^p \int_{\Omega_{i,a}} A_{km}^a u_{i,a} u_{m,a} dv_g = O \left( \mu_{i,a}^{n-2} r_{i,a}^{2-n} \right) + T_{k,l}^a.
\]

Coming back to (9-26) with all these estimates, thanks to (9-7), we obtain that \( S_{k,l}^a = T_{k,l}^a \). In particular, \( \sum_k S_{k,l}^a \Lambda_{i,k} = \sum_k T_{k,l}^a \Lambda_{i,k} \) and Step 2 follows from Step 1. This ends the proof of Step 2. \( \square \)

**Conclusion of the proof of Proposition 9.2.** Equations (9-4) and (9-5) follow from Step 2. It remains to prove that \( \langle \Lambda_i, \mathcal{W}_i(0) \rangle_{\mathcal{B}_F} = 0 \). We assume here that \( \sqrt{\mu_i} r_{i,a} = o \left( \sqrt{\mu_i} \right) \). In particular, \( r_{i,a} \to 0 \) as \( \alpha \to +\infty \). Let \( Y \) be an arbitrary 1-form in \( \mathbb{R}^n \). We apply once more the Pohozaev identity (7-2) to \( u_a \) in \( \Omega_{i,a} \). However, here we choose \( X = X_a \) to be given in the exponential chart at \( x_i,a \) by

\[
X_a = Y_k - \frac{2}{3} R_{xkl}^a(x_i,a) x^j x^k Y_l,
\]
where \( Y^l = Y_l \) for all \( l \) and the \( R_{ijkl} \) are the components of the Riemann tensor \( Rm_g \) at \( x_{i,a} \) in the exponential chart. As is easily checked, still in geodesic normal coordinates at \( x_{i,a} \),

\[
(\nabla X^a)_{kj} = -\mathcal{R}_{ijkl}(x_{i,a})x^k Y^l + O(|x|^2),
\]

so that \( \text{div}_g(X^a) = O(|x|^2) \). Then, thanks to the symmetries of the Riemann tensor, we obtain with the Pohozaev identity that

\[
\int_{\partial \Omega_{i,a}} \left( \frac{1}{2} X^a(v)|\nabla u_a|^2 - \langle X^a(\nabla u_a), \partial_i u_a \rangle \right) d\sigma_g + \int_{\Omega_{i,a}} \langle A_a u_a, X^a(\nabla u_a) \rangle_{\mathbb{R}^p} dv_g = O\left( \int_{\partial \Omega_{i,a}} |u_a|^2 d\sigma_g \right) + O\left( \int_{\partial \Omega_{i,a}} |u_a| d\sigma_g \right),
\]

Estimating the right-hand side of \( (9-27) \) via \( (9-7) \) and using Lemma 8.1 and Lemma 8.2, we get

\[
\int_{\partial \Omega_{i,a}} \left( \frac{1}{2} X^a(v)|\nabla u_a|^2 - \langle X^a(\nabla u_a), \partial_i u_a \rangle \right) d\sigma_g + \int_{\Omega_{i,a}} \langle A_a u_a, X^a(\nabla u_a) \rangle_{\mathbb{R}^p} dv_g = \hat{R}_i(a),
\]

where \( \hat{R}_i(a) \) is such that

\[
\hat{R}_i(a) = \begin{cases} 
O\left( \mu_{i,a}^2 \ln \mu_{i,a} \right) + O\left( \mu_{i,a}^{n-2-\frac{2}{r-2}} \right) & \text{if } n = 4, \\
O\left( \mu_{i,a}^2 \right) + O\left( \mu_{i,a}^{n-2-\frac{2}{r-2}} \right) & \text{if } n \geq 5.
\end{cases}
\]

Now we can write

\[
\int_{\Omega_{i,a}} \langle A_a u_a, X^a(\nabla u_a) \rangle_{\mathbb{R}^p} dv_g = \sum_{k,l=1}^p A^a_{kl}(x_{i,a}) \int_{\Omega_{i,a}} u_{k,a} X^a(\nabla u_a) dv_g + O(T_a),
\]

where

\[
T_a = \int_{\Omega_{i,a}} d_g(x_{i,a}, x)|\nabla u_a||u_a| dv_g,
\]

obtaining

\[
\int_{\Omega_{i,a}} \langle A_a u_a, X^a(\nabla u_a) \rangle_{\mathbb{R}^p} dv_g = \frac{1}{2} \sum_{k,l=1}^p A^a_{kl}(x_{i,a}) \int_{\Omega_{i,a}} u_{k,a} u_{l,a} X^a(v) \ n\sigma_g - \frac{1}{2} \sum_{k,l=1}^p A^a_{kl}(x_{i,a}) \int_{\Omega_{i,a}} u_{k,a} u_{l,a} \ \text{div}_g(X^a) \ dv_g + O(T_a).
\]

As above, estimating the various terms in this equation, it follows that

\[
\int_{\Omega_{i,a}} \langle A_a u_a, X^a(\nabla u_a) \rangle_{\mathbb{R}^p} dv_g = \hat{R}_i(a),
\]

where \( \hat{R}_i(a) \) is as in \( (9-29) \). As a consequence, coming back to \( (9-28) \), thanks to \( (9-30) \), we get

\[
\int_{\partial \Omega_{i,a}} \left( \frac{1}{2} X^a(v)|\nabla u_a|^2 - \langle X^a(\nabla u_a), \partial_i u_a \rangle \right) d\sigma_g = \hat{R}_i(a),
\]

(9-31)
where $$\dot{R}_i(a)$$ is as in (9-29). By Lemmas 8.2 and 9.1, together with (9-7), we have
\[
\int_{\partial\Omega_{i,a}} \left( \frac{1}{2} X^a(v) \left| \nabla u_{i,a} \right|^2 - \left( X^a(\nabla u_{i,a}), \partial_v u_{i,a} \right) \right) d\sigma_g \equiv \mu_{i,a}^{1-\alpha} (\Lambda_i, (\nabla \mathcal{H}_i)_0)_{\mathbb{R}^p} + o(1) \mu_{i,a}^{4-n} \dot{R}_i(a), \tag{9-32}
\]
where $$(\nabla \mathcal{H}_i)_0 \in \mathbb{R}^p$$ is such that $$(\nabla \mathcal{H}_i)_0 = \sum_{l=1}^n Y_l (\nabla \mathcal{H}_{i,l})(0)$$ for all $$l = 1, \ldots, p$$, and
\[
\dot{W}_a = \begin{cases} 
\phi(\mu_{i,a}^{2-\alpha}(\ln \mu_{i,a})^{3/2}) & \text{if } n = 4, \\
\phi(\mu_{i,a}^{2}) & \text{if } n \geq 5.
\end{cases}
\]
As a consequence of Step 2 we have
\[
\mu_{i,a} = \begin{cases} 
\mathcal{O}\left((\ln \mu_{i,a})^{1/2}\right) & \text{if } n = 4, \\
\mathcal{O}(\mu_{i,a}^{(n-4)/(n-2)}) & \text{if } n \geq 5.
\end{cases}
\]
Coming back to (9-31)–(9-32), it follows that $$(\Lambda_i, (\nabla \mathcal{H}_i)_0)_{\mathbb{R}^p} = 0$$, and since $$Y$$ is arbitrary, we get $$(\Lambda_i, \nabla \mathcal{H}_i(0))_{\mathbb{R}^p} \equiv 0$$.

10. Proof of Theorem 0.1

We prove Theorem 0.1 using Proposition 9.2. We let $$(A_n)_a$$ be a sequence of $$C^1$$ maps from $$M$$ to $$M^+_p(\mathbb{R})$$ such that $$A_n \to A$$ in $$C^1(M)$$ as $$\alpha \to +\infty$$ for some $$C^1$$ map $$A$$ from $$M$$ to $$M^+_p(\mathbb{R})$$ satisfying (H) and (H'). We also let $$(\mathcal{U}_n)_a$$ be an arbitrary bounded sequence in $$H^1(M)$$ of nonnegative solutions of (1-1) and we assume by contradiction that $$\|u_n\|_\infty \to +\infty$$ as $$\alpha \to +\infty$$. We order the blow-up points of the $$\mathcal{U}_n$$’s in such a way that
\[
\mu_{i,a} = \mu_{1,a} \geq \cdots \geq \mu_{N,a},
\]
where the $$\mu_{i,a}$$’s are the weights of the vector bubble $$(\mathcal{B}^i_n)_{a}$$ in Proposition 4.2, and we let $$\mathcal{B}_i$$ be as in (8-4). We consider $$\mathcal{B}_1$$. By (H'), Ker $$A_n(x) \cap \text{Vect}_+ (\mathbb{R}^p) = \{0\}$$ for all $$x \in M$$, where $$A_n$$ is as in (0-2). In particular, if the $$\mu_{i,a}$$’s are as in (8-3), it follows from Step 2 in Section 9 that $$r_{1,a} \to 0$$ as $$\alpha \to +\infty$$. As a direct consequence, $$\mathcal{B}_1 \neq \emptyset$$. Let $$i \in \mathcal{B}_1$$. Still by Step 2 in Section 9, we have $$r_{i,a} \to 0$$ as $$\alpha \to +\infty$$. By Proposition 9.2, since Ker $$A_n(x) \cap \text{Vect}_+ (\mathbb{R}^p) = \{0\}$$ for all $$x \in M$$, for any $$i \in \mathcal{B}_1 \cup \{1\}$$, there exists $$C_i > 0$$ such that
\[
r_{i,a}^2 \ln \frac{1}{\mu_{i,a}} \to C_i \text{ if } n = 4 \quad \text{and} \quad r_{i,a}^{4-n} \mu_{i,a}^{4-n} \to C_i \text{ if } n \geq 5.
\]
as $$\alpha \to +\infty$$. By (10-1), $$\mu_{i,a} = o(r_{i,a})$$ for all $$i \in \mathcal{B}_1 \cup \{1\}$$. We also get from (10-1) that for any $$i \in \mathcal{B}_1 \cup \{1\}$$,
\[
\mu_{i,a} = o(r_{i,a}^2) \text{ if } n = 4, 5 \quad \text{and} \quad \mu_{i,a} = o(r_{i,a}) \text{ if } n \geq 7.
\]
As a remark, it follows from (10-2) that $$\mathcal{U}_\infty \equiv 0$$ when $$n = 4, 5$$ since, if not the case, $$r_{i,a}^2 \leq \mu_{i,a}$$. It also follows from (10-2) that for any $$i \in \mathcal{B}_1 \cup \{1\}$$, $$\mathcal{B}_i \cap \mathcal{B}_j \neq \emptyset$$, where the $$\mathcal{B}_i$$’s are as in (8-8). By (9-3), we get with (10-2) that
\[
\mathcal{H}_i(z) = \sum_{j \in \mathcal{B}_i \cap \mathcal{B}_j} \frac{\lambda_{i,j} A_j}{|z - z_{i,j}|^{n-2}},
\]
where $$\lambda_{i,j} = \begin{cases} 
1 & \text{if } j = i, \\
0 & \text{otherwise}.
\end{cases}$$
where \( \mathcal{H}_i \) is as in Lemma 9.1. In particular, the \( \Lambda_i \)'s are the \( S^{p-1} \) projections of the bubbles \((\mathcal{B}_a)^i\). Let \( \mathcal{E}_1 = (\mathcal{A}_1 \cap \mathcal{B}_1) \cup \{1\} \). For any \( i \in \mathcal{A}_1 \cap \mathcal{B}_1 \), we have \( \mathcal{A}_1 \cap \mathcal{B}_1 = \mathcal{E}_1 \setminus \{i\} \).

We pick up some \( i \in \mathcal{E}_1 \) such that

\[
d_g(x_{1,a}, x_{i,a}) \geq d_g(x_{1,a}, x_{j,a}) \quad \text{for all} \quad j \in \mathcal{E}_1.
\]

By Proposition 9.2 we have \( \langle \Lambda_i, \nabla \mathcal{H}_i(0) \rangle_{\mathbb{R}^p} = 0 \). Together with (10-3), this implies that \( \langle \Lambda_i, \Lambda_j \rangle_{\mathbb{R}^p} = 0 \) for all \( j \in \mathcal{E}_1 \setminus \{i\} \). Repeating the operation with \( \mathcal{E}_1 \setminus \{i\} \), and so on up to exhaust all the indices in \( \mathcal{E}_1 \), we obtain that \( \langle \Lambda_i, \Lambda_j \rangle_{\mathbb{R}^p} = \delta_{ij} \) for all \( i, j \in \mathcal{E}_1 \). Moreover, it follows from (9-4) and (9-5) in Proposition 9.2 that \( V = \text{Vect}\{\Lambda_i, i \in \mathcal{E}_1\} \) is a stable vector space of \( A_n(x_1) \). Noting that \( \langle \Lambda_i, \mathcal{H}_i(0) \rangle_{\mathbb{R}^p} = 0 \) for all \( i \in \mathcal{E}_1 \), we also get with (9-4) and (9-5) in Proposition 9.2 that the \( \Lambda_i \)'s are isotropic vectors for \( A_n(x_1) \) for all \( i \in \mathcal{E}_1 \). In particular, we get a contradiction with \( (H') \).

This proves Theorem 0.1 when \( n \neq 6 \). When \( n = 6 \), thanks to Proposition 2.1, it remains to prove that our systems are weakly stable, and thus that we necessarily have \( \mathcal{H}_\infty \neq 0 \) if we assume \( (H') \).

When \( n = 6 \), it follows from (10-1) that \( r_{i,a}^2 \sim \mu_{i,a} \). Then, by (9-3),

\[
\mathcal{H}_i(z) = \sum_{j \in \mathcal{A}_1 \cap \mathcal{B}_1} \frac{\lambda_{i,j} \Lambda_j}{|z - z_{i,j}|^{p-2} + C \mathcal{H}_\infty(x_1)},
\]

where \( r_{i,a}^{-2} \mu_{i,a} \to C \) as \( \alpha \to +\infty \). As above, \( \langle \Lambda_i, \Lambda_j \rangle_{\mathbb{R}^p} = \delta_{ij} \) for all \( i, j \in \mathcal{E}_1 \), but we may have \( \mathcal{E}_1 = \{1\} \).

By Proposition 9.2, \( V = \text{Vect}\{\Lambda_i, i \in \mathcal{E}_1\} \) is a stable vector space of \( A_6(x_1) \) and the \( \Lambda_i \)'s are isotropic vectors for \( A_6(x_1) \) for all \( i \in \mathcal{E}_1 \) if \( \mathcal{H}_\infty(x_1) = 0 \). In particular, we do get a contradiction with \( (H') \) if \( \mathcal{H}_\infty(x_1) = 0 \). This proves Theorem 0.1 when \( n = 6 \).

As a remark, if \( n = 6 \) and \( A_6 < 0 \) in \( M \) in the sense of bilinear forms, where \( A_6 \) is as in (0-2), then we also get a contradiction by (9-5) in Proposition 9.2 since \( r_{i,a}^2 \sim \mu_{i,a} \) and \( \mathcal{H}_i(0) \). Letting \( \mathcal{H}_i(0) \), \( \{\Lambda_i, \mathcal{H}_i(0)\} \) be \( \Lambda_i \in \text{Vect}_+(\mathbb{R}^p) \). In particular, we recover analytic stability for our systems if we assume that \( A_6 < 0 \) in \( M \) in the sense of bilinear forms. More precisely, letting \( (M, g) \) be a smooth compact six-dimensional Riemannian manifold, \( p \geq 1 \) be an integer, and \( A : M \to M^p_+(\mathbb{R}) \) be a \( C^1 \)-map such that \( A \) satisfies \( (H) \), the system (0-1) associated with \( A \) is analytically stable if \( A_6(x) < 0 \) in the sense of bilinear forms for all \( x \).

As another remark, it is easily seen from (9-4) and (9-5) in Proposition 9.2 that for any \( n \geq 4 \), and any \( i \in \mathcal{A}_1 \cup \{1\} \), \( A_n(x_1) \Lambda_i \in \text{Vect}_+(\mathbb{R}^p) \). In particular, we can replace \( (H') \) in Theorem 0.1 by the slightly more general condition that for any \( x \in M \), and any \( k \in \{1, \ldots, p\} \), there does not exist an orthonormal family \((e_1, \ldots, e_k)\) of vectors in \( \mathcal{I}_a(x) \cap \text{Vect}_+(\mathbb{R}^p) \) such that \( A_n(x) V \subset V \) and \( A_n(x) e_i \in \text{Vect}_+(\mathbb{R}^p) \) for all \( i \), where \( V \) is the \( k \)-dimensional subspace of \( \mathbb{R}^p \) with basis \((e_1, \ldots, e_k)\).

As a final remark we mention that Theorem 0.1 still holds true, and can be proved with only slight modifications in the arguments of Section 9, if the \( C^1 \) convergence of the \( A_a \)'s is replaced by a \( C^{0,\theta} \) convergence of the \( A_a \)'s with \( \theta = 1 \) when \( n = 4 \), and \( \theta > 2/(n - 2) \) when \( n \geq 5 \).

GLOBAL REGULARITY FOR A LOGARITHMICALLY SUPERCRITICAL
HYPERDISSIPATIVE NAVIER–STOKES EQUATION

TERENCE TAO

Let $d \geq 3$. We consider the global Cauchy problem for the generalized Navier–Stokes system

$$
\partial_t u + (u \cdot \nabla) u = -D^2 u - \nabla p, \quad \nabla \cdot u = 0, \quad u(0, x) = u_0(x)
$$

for $u : \mathbb{R}^+ \times \mathbb{R}^d \to \mathbb{R}^d$ and $p : \mathbb{R}^+ \times \mathbb{R}^d \to \mathbb{R}$, where $u_0 : \mathbb{R}^d \to \mathbb{R}^d$ is smooth and divergence free, and $D$ is a Fourier multiplier whose symbol $m : \mathbb{R}^d \to \mathbb{R}^+$ is nonnegative; the case $m(\xi) = |\xi|$ is essentially Navier–Stokes. It is folklore that one has global regularity in the critical and subcritical hyperdissipation regimes $m(\xi) = |\xi|^\alpha$ for $\alpha \geq (d+2)/4$. We improve this slightly by establishing global regularity under the slightly weaker condition that $m(\xi) \geq |\xi|^{(d+2)/4}/g(|\xi|)$ for all sufficiently large $\xi$ and some nondecreasing function $g : \mathbb{R}^+ \to \mathbb{R}^+$ such that $\int_1^\infty ds / (sg(s)^4) = +\infty$. In particular, the results apply for the logarithmically supercritical dissipation $m(\xi) := |\xi|^{(d+2)/4}/\log(2 + |\xi|^2)^{1/4}$.

1. Introduction

Let $d \geq 3$. This note is concerned with solutions to the generalized Navier–Stokes system

$$
\partial_t u + (u \cdot \nabla) u = -D^2 u - \nabla p, \quad \nabla \cdot u = 0,
$$

$$
u(x) = u_0(x),
$$

where $u : \mathbb{R}^+ \times \mathbb{R}^d \to \mathbb{R}^d$, $p : \mathbb{R}^+ \times \mathbb{R}^d \to \mathbb{R}$ are smooth, and $u_0 : \mathbb{R}^d \to \mathbb{R}^d$ is smooth, compactly supported, and divergence-free, and $D$ is a Fourier multiplier whose symbol $m : \mathbb{R}^d \to \mathbb{R}^+$ is nonnegative; the case $m(\xi) = |\xi|$ is essentially the Navier–Stokes system, while the case $m = 0$ is the Euler system.

For $d \geq 3$, the global regularity of the Navier–Stokes system is of course a notoriously difficult unsolved problem, due in large part to the supercritical nature of the equation with respect to the energy $E(u(t)) := \int_{\mathbb{R}^d} |u(t, x)|^2 \, dx$. This supercriticality can be avoided by strengthening the dissipative symbol $m(\xi)$, for instance setting $m(\xi) := |\xi|^\alpha$ for some $\alpha > 1$. This hyper-dissipative variant of the Navier–Stokes equation becomes subcritical for $\alpha > (d+2)/4$ (and critical for $\alpha = (d+2)/4$), and it is known that global regularity can be recovered in these cases; see [Katz and Pavlović 2002] for further discussion. For $1 \leq \alpha < (d+2)/4$, only partial regularity results are known; see [Caffarelli et al. 1982] for the case $\alpha = 1$ and [Katz and Pavlović 2002] for the case $\alpha > 1$.

1 The exact definition of the Fourier transform is inessential here, but for concreteness, take $\hat{f}(\xi) := \int_{\mathbb{R}^d} f(x)e^{-ix\cdot\xi} \, dx$. 
The purpose of this note is to extend the global regularity result very slightly into the supercritical regime.

**Theorem 1.1.** Suppose that $m$ obeys the lower bound

$$m(ξ) \geq |ξ|^{(d+2)/4} / g(|ξ|)$$

for all sufficiently large $|ξ|$, where $g : \mathbb{R}^+ \to \mathbb{R}^+$ is a nondecreasing function such that

$$\int_1^\infty \frac{ds}{sg(s)^4} = \infty.$$

Then for any smooth, compactly supported initial data $u_0$, one has a global smooth solution to (1).

Note that the hypotheses are for instance satisfied when

$$m(ξ) := |ξ|^{(d+2)/4} / \log^{1/4}(2 + |ξ|^2);$$

thus

$$|D|^2 = \frac{(-\Delta)^{(d+2)/4}}{\log^{1/2}(2 - \Delta)}.$$

Analogous “barely supercritical” global regularity results were established for the nonlinear wave equation recently [Tao 2007; Roy 2008; 2009].

The argument is quite simple, being based on the classical energy method and Sobolev embedding. The basic point is that whereas in the critical and subcritical cases one can get an energy inequality of the form

$$\partial_t \|u(t)\|_{H^k(\mathbb{R}^d)}^2 \leq Ca(t)\|u(t)\|_{H^k(\mathbb{R}^d)}^2$$

for some locally integrable function $a(t)$ of time, a constant $C$, and some large $k$, which by Gronwall’s inequality is sufficient to establish a suitable *a priori* bound, in the logarithmically supercritical case (4) one instead obtains the slightly weaker inequality

$$\partial_t \|u(t)\|_{H^k(\mathbb{R}^d)}^2 \leq Ca(t)\|u(t)\|_{H^k(\mathbb{R}^d)}^2 \log(2 + \|u(t)\|_{H^k(\mathbb{R}^d)})$$

(thanks to an endpoint version of Sobolev embedding, closely related to an inequality of Brézis and Wainger [1980]), which is still sufficient to obtain an *a priori* bound (though one which is now double-exponential rather than single-exponential; compare [Beale et al. 1984]).

**Remark 1.2.** It may well be that the condition (3) can be relaxed further by a more sophisticated argument. Indeed, the following heuristic suggests that one should be able to weaken (3) to

$$\int_1^\infty \frac{ds}{sg(s)^2} = \infty,$$

thus allowing one to increase the $\frac{1}{4}$ exponent in (4) to $\frac{1}{2}$. Consider a blowup scenario in which the solution blows up at some finite time $T_*$, and is concentrated on a ball of radius $1/N(t)$ for times $0 < t < T_*$, where $N(t) \to \infty$ as $t \to T_*$. As the energy of the fluid must stay bounded, we obtain the heuristic
bound \( u(t) = O(N(t)^{d/2}) \) for times \( 0 < t < T_* \). In particular, we expect the fluid to propagate at speeds \( O(N(t)^{d/2}) \), leading to the heuristic ODE

\[
\frac{d}{dt} \frac{1}{N(t)} = O(N(t)^{d/2})
\]

for the radius \( 1/N(t) \) of the fluid. Solving this ODE, we are led to a heuristic upper bound \( N(t) = O((T_* - t)^{2/(d+2)}) \) on the blowup rate. On the other hand, from the energy inequality

\[
2 \int_0^{T_*} \int_{\mathbb{R}^d} |Du(t, x)|^2 \, dx \, dt \leq \int_{\mathbb{R}^d} |u_0(x)|^2 \, dx
\]

one is led to the heuristic bound

\[
\int_0^{T_*} \frac{1}{N(t)^{(d+2)/2}g(N(t))^2} \, dt < \infty.
\]

This is incompatible with the upper bound \( N(t) = O((T_* - t)^{2/(d+2)}) \) if \( \int_1^{T_*} ds / (sg(s)^2) = \infty \). Unfortunately the author was not able to make this argument precise, as there appear to be multiple and inequivalent ways to rigorously define an analogue of the “frequency scale” \( N(t) \), and all attempts of the author to equate different versions of these analogues lost one or more powers of \( g(s) \).

To go beyond the barrier \( \int_1^\infty ds / (sg(s)^2) = \infty \) (with the aim of getting closer to the Navier–Stokes regime, in which \( g(s) = s^{1/4} \) in three dimensions), the heuristic analysis above suggests that one would need to force the energy to not concentrate into small balls, but instead to exhibit turbulent behaviour.

## 2. Proof of theorem

We now prove Theorem 1.1. Let \( k \) be a large integer (for example, \( k := 100d \) will suffice).

Standard energy method arguments (see, for example, [Kato 1985]) show that if the initial data is smooth and compactly supported, then either a smooth \( H^\infty \) solution exists for all time, or there exists a smooth solution up to some blowup time \( 0 < T_* < \infty \), and \( \|u(t)\|_{H^k(\mathbb{R}^d)} \to \infty \) as \( t \to T_* \). Thus, to establish global regularity, it suffices to prove an \emph{a priori bound} of the form

\[
\|u(t)\|_{H^k(\mathbb{R}^d)} \leq C(k, d, \|u_0\|_{H^k(\mathbb{R}^d)}, T, g)
\]

for all \( 0 \leq t \leq T < \infty \) and all smooth \( H^\infty \) solutions \( u : [0, T] \times \mathbb{R}^d \to \mathbb{R}^d \) to (1), where the quantity \( C(k, d, \|u_0\|_{H^k(\mathbb{R}^d)}, T, g) \) only depends on \( k, d, \|u_0\|_{H^k(\mathbb{R}^d)}, T, \) and \( g \).

We now fix \( u_0, u, T, \) and let \( C \) denote any constant depending on \( k, d, \|u_0\|_{H^k(\mathbb{R}^d)}, T, \) and \( g \) (whose value can vary from line to line). Multiplying the Navier–Stokes equation by \( u \) and integrating by parts, we obtain the well-known energy identity

\[
\partial_t \int_{\mathbb{R}^d} |u(t, x)|^2 \, dx = -2a(t),
\]

where

\[
a(t) := \|Du\|^2_{L^2(\mathbb{R}^d)}
\]

(5)
(note that the pressure term $\nabla p$ disappears thanks to the divergence free condition); integrating this in time, we obtain the energy dissipation bound

$$\int_0^T a(t) \, dt \leq C. \quad (6)$$

Now, we consider the higher energy

$$E_k(t) := \sum_{j=0}^k \int_{\mathbb{R}^d} |\nabla^j u(t, x)|^2 \, dx. \quad (7)$$

Differentiating (7) in time and integrating by parts, we obtain

$$\partial_t E_k(t) = -2 \sum_{j=0}^k \|\nabla^j Du(t)\|_{L^2(\mathbb{R}^d)}^2 - 2 \sum_{j=0}^k \int_{\mathbb{R}^d} \nabla^j u(t, x) \cdot \nabla^j ((u \cdot \nabla)u)(t, x) \, dx;$$

again, the pressure term disappears thanks to the divergence-free condition. For brevity we shall now drop explicit mention of the $t$ and $x$ variables.

We apply the Leibniz rule to $\nabla^j ((u \cdot \nabla)u)$. There is one term involving $(j+1)$-st derivatives of $u$, but the contribution of that term vanishes by integration by parts and the divergence free property. The remaining terms give contributions of the form

$$\sum_{j=0}^k \sum_{1 \leq j_1, j_2 \leq j} \int_{\mathbb{R}^d} C(\nabla^j u \nabla^{j_1} u \nabla^{j_2} u) \, dx,$$

where $C(\nabla^j u \nabla^{j_1} u \nabla^{j_2} u)$ denotes some constant-coefficient trilinear combination of the components of $\nabla^j u$, $\nabla^{j_1} u$, and $\nabla^{j_2} u$ whose explicit form is easily computed, but is not of importance to our argument.

We can integrate by parts using $D$ and $D^{-1}$ and then use Cauchy–Schwarz to obtain the bound

$$\int_{\mathbb{R}^d} C(\nabla^j u \nabla^{j_1} u \nabla^{j_2} u) \, dx \leq \|\nabla^j u\|_{L^2(\mathbb{R}^d)} \|\nabla^{j_1} u\|_{L^2(\mathbb{R}^d)} \|\nabla^{j_2} u\|_{L^2(\mathbb{R}^d)}.$$

By the arithmetic mean-geometric mean inequality we then have

$$\int_{\mathbb{R}^d} C(\nabla^j u \nabla^{j_1} u \nabla^{j_2} u) \, dx \leq c \|\nabla^j u\|_{L^2(\mathbb{R}^d)}^2 \|\nabla^{j_1} u\|_{L^2(\mathbb{R}^d)} \|\nabla^{j_2} u\|_{L^2(\mathbb{R}^d)} + \frac{1}{c} \|\nabla^j u\|_{L^2(\mathbb{R}^d)}^2 \|\nabla^{j_1} u\|_{L^2(\mathbb{R}^d)} \|\nabla^{j_2} u\|_{L^2(\mathbb{R}^d)}$$

for any $c > 0$. Finally, from the triangle inequality, (7), and the fact that $D$ commutes with $\nabla^j$, we have

$$\|\nabla^j u\|_{L^2(\mathbb{R}^d)}^2 \leq c \|\nabla^j Du\|_{L^2(\mathbb{R}^d)}^2 + E_k.$$

Putting this all together and choosing $c$ small enough, we conclude that

$$\partial_t E_k \leq CE_k + C \sum_{1 \leq j_1, j_2 \leq k} \|\nabla^{j_1} u\|_{L^2(\mathbb{R}^d)} \|\nabla^{j_2} u\|_{L^2(\mathbb{R}^d)} \|\nabla^j Du\|_{L^2(\mathbb{R}^d)}.$$

To estimate this expression, we introduce a parameter $N > 1$ (depending on $t$) to be optimised later, and write

$$(1 + D)^{-1} = (1 + D)^{-1} P_{\leq N} + (1 + D)^{-1} P_{> N},$$
where $P_{\leq N}$ and $P_{> N}$ are the Fourier projections to the regions $\{\xi : |\xi| \leq N\}$ and $\{\xi : |\xi| > N\}$.

We first deal with the low-frequency contribution to (8). From Plancherel’s theorem and (2) we obtain

$$\left\| (1 + D)^{-1} P_{\leq N} (\mathcal{C}(\nabla^j u \nabla^j u)) \right\|_{L^2(\mathbb{R}^d)} \leq C g(N) \left\| (\nabla)^{-(d+2)/4} \mathcal{C}(\nabla^j u \nabla^j u) \right\|_{L^2(\mathbb{R}^d)},$$

where $(\nabla)^{-(d+2)/4}$ is the Fourier multiplier with symbol $(\xi)^{-(d+2)/4}$, where $(\xi) := (1 + |\xi|^2)^{1/2}$. Applying Sobolev embedding, we can bound the right-hand side by

$$\leq C g(N) \left\| \nabla^j u \right\|_{L^{4d/(3d+2)}(\mathbb{R}^d)} \left\| \nabla^{j+2} u \right\|_{L^2(\mathbb{R}^d)}.$$

By Hölder’s inequality and the Gagliardo–Nirenberg inequality, we can bound this by

$$\leq C g(N) \left\| \nabla u \right\|_{L^{4d/(d+2)}(\mathbb{R}^d)} \left\| \nabla^{j+2} u \right\|_{L^2(\mathbb{R}^d)},$$

which by (7) is bounded by

$$\leq C g(N) \left\| \nabla u \right\|_{L^{4d/(d+2)}(\mathbb{R}^d)} E_k^{1/2}.$$

Next, we partition

$$\left\| \nabla u \right\|_{L^{4d/(d+2)}(\mathbb{R}^d)} \leq \left\| \nabla P_{\leq N} u \right\|_{L^{4d/(d+2)}(\mathbb{R}^d)} + \left\| \nabla P_{> N} u \right\|_{L^{4d/(d+2)}(\mathbb{R}^d)}.$$

From Sobolev embedding and Plancherel, together with (2) and (5), we have

$$\left\| \nabla P_{\leq N} u \right\|_{L^{4d/(d+2)}(\mathbb{R}^d)} \leq C \left\| (\nabla)^{d+2/4} P_{\leq N} u \right\|_{L^2(\mathbb{R}^d)} \leq C g(N) (1 + a(t))^{1/2}.$$  

Meanwhile, from Sobolev embedding we have

$$\left\| \nabla P_{> N} u \right\|_{L^{4d/(d+2)}(\mathbb{R}^d)} \leq \frac{1}{N^2} E_k^{1/2},$$

(say) if $k$ is large enough. Putting this all together, we see that the low-frequency contribution to (8) is

$$\leq C g(N)^2 E_k \left[ g(N)^2 (1 + a(t)) + \frac{1}{N^2} E_k \right].$$

Next, we turn to the high-frequency contribution to (8). From Plancherel, Hölder’s inequality, and (7) we have

$$\left\| (1 + D)^{-1} P_{> N} (\mathcal{C}(\nabla^j u \nabla^j u)) \right\|_{L^2(\mathbb{R}^d)} \leq C g(N) N^{-(d+2)/4} \left\| \nabla^j u \right\|_{L^2(\mathbb{R}^d)} \left\| \nabla^j u \right\|_{L^2(\mathbb{R}^d)} \leq C g(N) N^{-(d+2)/4} \left\| \nabla^j u \right\|_{L^\infty(\mathbb{R}^d)} E_k^{1/2},$$

while from Sobolev embedding and (7) we see (for $k$ large enough) that

$$\left\| \nabla^j u \right\|_{L^\infty(\mathbb{R}^d)} \leq C E_k^{1/2}.$$

Thus the high-frequency contribution to (8) is at most $C g(N)^2 N^{-(d+2)/2} E_k^2$.

Putting this all together, we conclude that

$$\partial_t E_k \leq C g(N)^2 E_k \left[ g(N)^2 (1 + a(t)) + \frac{1}{N} E_k \right].$$

We now optimize in $N$, setting $N := 1 + E_k$, to obtain

$$\partial_t E_k \leq C g(1 + E_k)^4 E_k (1 + a(t)).$$
From (6), (3) and separation of variables we see that the ODE
\[ \partial_t E = Cg(1 + E)^4 E(1 + a(t)) \]
with initial data \( E(0) \geq 0 \) does not blow up in time. Also, from (7) we have \( E_k(0) \leq C \). A standard ODE comparison (or continuity) argument then shows that \( E_k(t) \leq C(T) \) for all \( 0 \leq t \leq T \), and the claim follows.

**Remark 2.1.** It should be clear to the experts that the domain \( \mathbb{R}^d \) here could be replaced by any other sufficiently smooth domain, for example, the torus \( \mathbb{R}^d / \mathbb{Z}^d \), using standard substitutes for the Littlewood–Paley type operators \( P_{\leq N}, P_{> N} \) (one could use spectral projections of the Laplacian). We omit the details.

Guidelines for Authors

Authors may submit manuscripts in PDF format on-line at the Submission page at pjm.math.berkeley.edu/apde.

Originality. Submission of a manuscript acknowledges that the manuscript is original and is not, in whole or in part, published or under consideration for publication elsewhere. It is understood also that the manuscript will not be submitted elsewhere while under consideration for publication in this journal.

Language. Articles in APDE are usually in English, but articles written in other languages are welcome.

Required items. A brief abstract of about 150 words or less must be included. It should be self-contained and not make any reference to the bibliography. If the article is not in English, two versions of the abstract must be included, one in the language of the article and one in English. Also required are keywords and subject classifications for the article, and, for each author, postal address, affiliation (if appropriate), and email address.

Format. Authors are encouraged to use \LaTeX but submissions in other varieties of \TeX, and exceptionally in other formats, are acceptable. Initial uploads should be in PDF format; after the refereeing process we will ask you to submit all source material.

References. Bibliographical references should be complete, including article titles and page ranges. All references in the bibliography should be cited in the text. The use of Bib\TeX is preferred but not required. Tags will be converted to the house format, however, for submission you may use the format of your choice. Links will be provided to all literature with known web locations and authors are encouraged to provide their own links in addition to those supplied in the editorial process.

Figures. Figures must be of publication quality. After acceptance, you will need to submit the original source files in vector graphics format for all diagrams in your manuscript: vector eps or vector PDF files are the most useful.

Most drawing and graphing packages (Mathematica, Adobe Illustrator, Corel Draw, MATLAB, etc.) allow the user to save files in one of these formats. Make sure that what you are saving is vector graphics and not a bitmap. If you need help, please write to graphics@mathscipub.org with details about how your graphics were generated.

White space. Forced line breaks or page breaks should not be inserted in the document. There is no point in your trying to optimize line and page breaks in the original manuscript. The manuscript will be reformatted to use the journal’s preferred fonts and layout.

Proofs. Page proofs will be made available to authors (or to the designated corresponding author) at a Web site in PDF format. Failure to acknowledge the receipt of proofs or to return corrections within the requested deadline may cause publication to be postponed.
