AN INVERSION OF THE STIELTJES TRANSFORM

RICHARD ROBINSON GOLDBERG
A generalized Lambert transform, or L-transform, is an integral of the form

\[ H(x) = \int_0^\infty \sum_{k=1}^\infty a_k e^{-kt} \psi(t) dt. \]

In this paper we shall invert the integral transform

\[ G(x) = \int_0^\infty \frac{\psi(t) t \, dt}{x^2 + t^2}, \quad 0 < x < \infty \]

by reducing it by means of a certain summation to an L-transform and then applying an inversion theorem for L-transforms.

From this we deduce an inversion formula for the Stieltjes transform. This is given in Theorem 3.

1. The inversion of the transform (1). We shall need the following theorem on L-transforms which is the case \( r = 1 \) of Theorem 7.7 in [1].

**Theorem 1.** Let \( \{a_k\}_{k=1}^\infty \) be a bounded sequence of non-negative numbers with \( a_k > 0 \). Let \( \{b_n\}_{n=1}^\infty \) be the (unique) sequence such that

\[ \sum_{d|n} a_d b_{n/d} = \begin{cases} 1, & m = 1 \\ 0, & m = 2, 3, \ldots, \end{cases} \]

the summation running over all divisors \( d \) of \( m \). If the \( b_n \) are also bounded and if

1. \( K(t) = \sum_{k=1}^\infty a_k e^{-kt} \) (\( 0 < t < \infty \))
2. \( H(x) = \int_0^\infty K(xt) \psi(t) dt \) converges for some \( x > 0 \)
3. \( \int_0^1 |\psi(t) \log t| \, dt < \infty \)

then

\[ \lim_{p \to \infty} \frac{(-1)^p}{p!} \binom{p}{t} \sum_{n=1}^{p+\infty} b_n n^p H^{(p)} \left( \frac{np}{t} \right) = \psi(t) \text{ almost everywhere} \ (0 < t < \infty). \]
Now let
\[ G(x) = \int_0^{\infty} \frac{\psi(t)t}{x^2 + t^2} \, dt \]
where we assume
\[ \int_0^{\infty} \frac{|\psi(t)|}{t} \, dt < \infty \quad \text{and} \quad \int_0^{\infty} \frac{|\psi(t) \log t|}{t} \, dt < \infty \, . \]

To reduce \( G(x) \) to an \( L \)-transform we define
\[ H_N(x) = \frac{1}{x} \left[ \frac{G(0)}{2} + \sum_{k=1}^{N} (-1)^k G\left(\frac{k\pi}{x}\right) \right] \quad N=1, 2, \ldots \]

Then
\[ H_N(x) = \int_0^{\infty} \psi(t) \left[ \frac{1}{2xt} + \sum_{k=1}^{N} \frac{(-1)^k xt}{(xt)^2 + (k\pi)^2} \right] \, dt \, . \]

For \( N=1, 2, \ldots \) we have
\[ \left| \sum_{k=1}^{N} \frac{(-1)^k xt}{(xt)^2 + (k\pi)^2} \right| < \frac{xt}{(xt)^2 + \pi^2} < \frac{1}{xt} \quad (0 < xt < \infty) . \]

(This is because the terms of the sum alternate in sign and decrease in absolute value so that the modulus of the sum is less than that of its first term.) Hence for any \( x > 0 \)
\[ \int_0^{\infty} \left| \psi(t) \left[ \frac{1}{2xt} + \sum_{k=1}^{N} \frac{(-1)^k xt}{(xt)^2 + (k\pi)^2} \right] \right| \, dt \leq \frac{3}{2x} \int_0^{\infty} \frac{1}{t} \, dt < \infty \, . \]

This, by dominated convergence, allows us to let \( N \) become infinite under the integral sign in (2) and we obtain
\[ H(x) = \lim_{N \to \infty} H_N(x) = \int_0^{\infty} \psi(t) \left[ \frac{1}{2xt} + \sum_{k=1}^{\infty} \frac{(-1)^k xt}{(xt)^2 + (k\pi)^2} \right] \, dt \quad (x > 0) . \]

But for \( z > 0 \)
\[ \frac{1}{2z} + \sum_{k=1}^{\infty} \frac{(-1)^k z}{x^2 + (k\pi)^2} = \frac{\operatorname{cosech} z}{2} = \frac{1}{e^z - e^{-z}} = \sum_{k=1}^{\infty} e^{-(2k-1)z} , \]

(see [3; 113]). Thus
\[ (3) \quad H(x) = \int_0^{\infty} \sum_{k=1}^{\infty} e^{-(2k-1)xt} \psi(t) \, dt = \int_0^{\infty} K(xt) \psi(t) \, dt \]

where \( K(t) = \sum_{k=1}^{\infty} a_k e^{-kt} \) and
It was shown in [2; 556] that the sequence \( \{b_n\}_{n=1}^\infty \) defined in Theorem 1 corresponding to the \( a_k \) in (4) is

(5) \[ b_{2n-1} = \mu_{2n-1} \,, \quad b_{2n} = 0 \,, \quad n = 1, 2, \cdots \]

Here the \( \mu_n \) are the Moebius numbers defined as \( \mu_1 = 1 \), \( \mu_n = (-1)^s \) if \( n \) is the product of \( s \) distinct primes and \( \mu_n = 0 \) if \( n \) is divisible by a square factor. The \( b_n \) are bounded, so that we may apply Theorem 1 (with the \( a_k \) and \( b_n \) as in (4) and (5)) to invert the L-transform (3) and obtain \( \phi(t) \) for almost all \( t > 0 \). These results are summarized in Theorem 2.

**Theorem 2.** Let

\[ G(x) = \int_0^\infty \frac{\phi(t)\, dt}{x^3 + t^3} \]

where

\[ \int_0^\infty \frac{|\phi(t)|}{t} \, dt < \infty \]

and

\[ \int_0^1 \frac{|\phi(t)| \log t}{t} \, dt < \infty \]

Then

\[ H(x) = \lim_{N \to \infty} \frac{1}{x} \left[ G(0) + \sum_{k=1}^\infty (-1)^k G \left( \frac{k\pi}{x} \right) \right] \]

exists for all positive \( x \) and

\[ H(x) = \int_0^\infty \sum_{k=1}^\infty e^{-ck\pi x} \phi(t) \, dt \, . \]

Moreover

\[ \lim_{p \to \infty} \frac{(-1)^p}{p!} \left( \frac{p\pi}{t} \right)^{p+1} \sum_{n=1}^\infty \mu_{2n-1} (2n-1)^p H^{(p)} \left( \frac{(2n-1)p}{t} \right) = \phi(t) \]

almost everywhere \((0 < t < \infty)\).

2. The inversion of the Stieltjes transform. Let

(6) \[ F(x) = \int_0^\infty \frac{\phi(t)}{x+t} \, dt \]
where
\[ \int_0^\infty \frac{|\varphi(t)|}{t} \, dt < \infty \quad \text{and} \quad \int_0^1 \frac{|\varphi(t) \log t|}{t} \, dt < \infty. \]

Let \( G(x) = \frac{1}{2} F(x^2) \), \( \varphi(t) = \varphi(t^2) \). Then
\[
G(x) = \frac{1}{2} F(x^2) = \frac{1}{2} \int_0^\infty \frac{\varphi(t)}{x^2 + t} \, dt = \int_0^\infty \frac{\varphi(t^2) t \, dt}{x^2 + t^2} = \int_0^\infty \frac{\varphi(t) t \, dt}{x^2 + t^2};
\]
also
\[
\int_0^\infty \frac{|\varphi(t)|}{t} \, dt = \int_0^\infty \frac{\varphi(t^2)}{t} \, dt = \frac{1}{2} \int_0^\infty \frac{\varphi(t)}{t} \, dt < \infty;
\]
similarly
\[
\int_0^1 \frac{|\varphi(t) \log t|}{t} \, dt < \infty.
\]

The assumptions of Theorem 2 thus hold. We can therefore use Theorem 2 to obtain \( \varphi(t^2) = \varphi(t^2) \) for almost all \( t > 0 \). This gives us \( \varphi(t) \) for almost all \( t > 0 \) and thus effects an inversion of the Stieltjes transform (6).

**Theorem 3.** Let
\[
F(x) = \int_0^\infty \frac{\varphi(t)}{x^2 + t} \, dt
\]
where
\[
\int_0^\infty \frac{|\varphi(t)|}{t} \, dt < \infty
\]
and
\[
\int_0^1 \frac{|\varphi(t) \log t|}{t} \, dt < \infty.
\]

Let
\[
G(x) = \frac{1}{2} F(x^2)
\]
and
\[
H(x) = \frac{1}{x} \left[ G(0) + \sum_{k=1}^\infty (-1)^k G\left(\frac{k\pi}{x}\right) \right]
\]
(the sum converging by Theorem 2). Then
\[ \lim_{p \to \infty} \frac{(-1)^p}{p!} \left( \frac{p}{\sqrt{t}} \right)^{p+1} \sum_{n=1}^{\infty} \mu_{m-n}(2n-1)^p H^{(p)} \left( \frac{(2n-1)p}{\sqrt{t}} \right) = \varphi(t) \]
almost everywhere \((0 < t < \infty)\).

Of course, the Stieltjes transform has been inverted under less restrictive conditions on \( \varphi(t) \). We believe the interest of this note lies in the use of the \( \mu_n \) as an inverting device.

**REFERENCES**

Mathematical papers intended for publication in the Pacific Journal of Mathematics should be typewritten (double spaced), and the author should keep a complete copy. Manuscripts may be sent to any of the editors. All other communications to the editors should be addressed to the managing editor, E. G. Straus at the University of California, Los Angeles 24, California.

50 reprints per author of each article are furnished free of charge; additional copies may be obtained at cost in multiples of 50.

The Pacific Journal of Mathematics is published quarterly, in March, June, September, and December. The price per volume (4 numbers) is $12.00; single issues, $3.50. Back numbers are available. Special price to individual faculty members of supporting institutions and to individual members of the American Mathematical Society: $4.00 per volume; single issues, $1.25.

Subscriptions, orders for back numbers, and changes of address should be sent to Pacific Journal of Mathematics, 2120 Oxford Street, Berkeley 4, California.
