# INVERSION AND REPRESENTATION THEOREMS FOR A GENERALIZED LAPLACE INTEGRAL

K. M. SAKSENA

1. Varma [8] introduced a generalization of the Laplace integral

$$(1) \quad \mathcal{F}(x) = \int_0^{\infty} e^{-xt} \phi(t) dt$$

in the form

$$(2) \quad F(x) = \int_0^{\infty} (xt)^{m-1/2} e^{-xt/2} W_{k,m}(xt) \phi(t) dt$$

where  $\phi(t) \in L(0, \infty)$ ,  $m > -1/2$  and  $x > 0$ . This generalization is a slight variant of an equivalent integral introduced earlier by Meijer [7] and reduces to (1) when  $k + m = 1/2$ . In a recent paper [1] Erdélyi has pointed out that the nucleus of (2) can be expressed as a fractional integral of  $e^{-xt}$  in terms of the operators of fractional integration introduced by Kober [6]. In this note two theorems have been given—one giving an inversion formula for the transform (2) and another giving necessary and sufficient conditions for the representation of a function as an integral of the form (2) by considering its nucleus as a fractional integral of  $e^{-xt}$ .

2. The operators are defined as follows.

$$I_{\eta, \alpha}^+ \mathcal{F}(x) = \frac{1}{\Gamma(\alpha)} x^{-\eta-\alpha} \int_0^x (x-u)^{\alpha-1} u^{\eta} \mathcal{F}(u) du$$

$$K_{\zeta, \alpha}^- \mathcal{F}(x) = \frac{1}{\Gamma(\alpha)} x^{\zeta} \int_x^{\infty} (u-x)^{\alpha-1} u^{-\zeta-\alpha} \mathcal{F}(u) du$$

where  $\mathcal{F}(x) \in L_p(0, \infty)$ ,  $1/p + 1/q = 1$  if  $1 < p < \infty$ ,  $1/q = 0$  if  $p = 1$ ,  $\alpha > 0$ ,  $\eta > -1/q$ ,  $\zeta > -1/p$ .

The Mellin transform  $\bar{M}_i \mathcal{F}(x)$  of a function  $\mathcal{F}(x) \in L_p(0, \infty)$  is defined as

$$\bar{M}_i \mathcal{F}(x) = \int_0^{\infty} \mathcal{F}(x) x^{it} dx \quad (p = 1)$$

and

$$= \lim_{X \rightarrow \infty} \int_{1/X}^X \mathcal{F}(x) x^{it-1/q} dx \quad (p > 1)$$

---

Received May 8, 1958.

The inverse Mellin transform  $\bar{M}^{-1}\phi(t)$  of a function  $\phi(t) \in L_q(-\infty, \infty)$  is defined by

$$(3) \quad \bar{M}^{-1}\phi(t) = \frac{1}{2\pi} \int_{-\infty}^{\infty} \phi(t)x^{-it} dt \quad (q = 1)$$

and

$$= \frac{1}{2\pi} \lim_{T \rightarrow \infty} \int_{-T}^T \phi(t)x^{-it-1/p} dt \quad (q > 1).$$

If the Mellin transform is applied to Kober's operators and the orders of integration are interchanged we obtain, under certain conditions,

$$\bar{M}_t \{I_{\eta, \alpha}^+ \mathcal{F}(x)\} = \frac{\Gamma\left(\eta + \frac{1}{q} - it\right)}{\Gamma\left[\alpha + \left(\eta + \frac{1}{q} - it\right)\right]} \bar{M}_t \mathcal{F}(x)$$

and

$$\bar{M}_t \{K_{\zeta, \alpha}^- \mathcal{F}(x)\} = \frac{\Gamma\left(\zeta + \frac{1}{p} + it\right)}{\Gamma\left[\alpha + \left(\zeta + \frac{1}{p} + it\right)\right]} \bar{M}_t \mathcal{F}(x).$$

But

$$\bar{M}_t(e^{-x}) = \int_0^{\infty} e^{-x} x^{it-1/q} dx = \Gamma\left(\frac{1}{p} + it\right) \text{ if } \frac{1}{p} > 0.$$

Therefore

$$\bar{M}_t \{I_{\eta, \alpha}^+(e^{-x})\} = \frac{\Gamma\left(\eta + \frac{1}{q} - it\right)\Gamma\left(\frac{1}{p} + it\right)}{\Gamma\left[\alpha + \left(\eta + \frac{1}{q} - it\right)\right]}$$

and

$$\bar{M}_t \{K_{\zeta, \alpha}^-(e^{-x})\} = \frac{\Gamma\left(\zeta + \frac{1}{p} + it\right)\Gamma\left(\frac{1}{p} + it\right)}{\Gamma\left[\alpha + \left(\zeta + \frac{1}{p} + it\right)\right]}.$$

By (3)

$$I_{\eta, \alpha}^+(e^{-x}) = \frac{1}{2\pi} \int_{-\infty}^{\infty} \frac{\Gamma\left(\eta + \frac{1}{q} - it\right)\Gamma\left(\frac{1}{p} + it\right)}{\Gamma\left[\alpha + \left(\eta + \frac{1}{q} - it\right)\right]} x^{-it-1/p} dt$$

and

$$(4) \quad K_{\zeta, \alpha}^-(e^{-x}) = \frac{1}{2\pi} \int_{-\infty}^{\infty} \frac{\Gamma\left(\zeta + \frac{1}{p} + it\right)\Gamma\left(\frac{1}{p} + it\right)}{\Gamma\left[\alpha + \left(\zeta + \frac{1}{p} + it\right)\right]} x^{-it-1/p} dt$$

provided that  $1/p > 0$ ,  $\eta + 1/q > 0$  and  $\zeta + 1/p > 0$ .

It has also been shown by Erdélyi [2] that if the integral in (4) is evaluated by the calculus of residues then it can be expressed in terms of a confluent hypergeometric function. In particular,

$$K_{2m, (1/2)-m-k}^-(e^{-x}) = x^{m-1/2} e^{-x/2} W_{k, m}(x)$$

where  $x > 0$ ,  $(1/2) - m - k > 0$ .

3. THEOREM 1. Assume  $\phi(t) \in L_p(0, \infty)$ ,  $1 \leq p < \infty$ ,  $x > 0$ . If  $2m > -1/q$  when  $(1/2) - m - k > 0$  and  $(1/2) + m - k > -1/q$  when  $(1/2) - m - k > 0$ , then  $K_{2m, (1/2)-m-k}^-[\mathcal{F}(x)]$  exists and is equal to

$$\int_0^\infty K_{2m, (1/2)-m-k}^-(e^{-xt})\phi(t)dt = F(x)$$

where  $\mathcal{F}(x)$  and  $F(x)$  are given by (1) and (2) respectively.

*Proof.* Case I  $(1/2) - m - k > 0$ ,  $1 < p < \infty$ .

If  $\phi(t) \in L_p(0, \infty)$ ,  $1 \leq p < \infty$  and  $x > 0$  it is easy to see that  $\mathcal{F}(x)$  exists. Therefore

$$K_{2m, (1/2)-m-k}^-[\mathcal{F}(x)] = \frac{x^{2m}}{\Gamma((1/2) - m - k)} \times \int_x^\infty (u - x)^{-(1/2) - m - k} u^{-(1/2) - m + k} \left\{ \int_0^\infty e^{-ut} \phi(t) dt \right\} du .$$

But from a theorem of Hardy [5] we know that if  $\phi(t) \in L_p(0, \infty)$ ,  $1 < p < \infty$  then  $u^{1-2/p} \mathcal{F}(u) \in L_p(0, \infty)$  and therefore  $(u - x)^\alpha u^\beta \mathcal{F}(u) \in L_p(x, \infty)$  provided that  $\alpha + \beta = 1 - 2/p$  and  $\alpha p > -1$ . Therefore the integral

$$\begin{aligned} & \int_x^\infty (u - x)^{-(1/2) - m - k} u^{-(1/2) - m + k} \mathcal{F}(u) du \\ & = \int_x^\infty \{(u - x)^{-(1/2) - m - k - \alpha} u^{-(1/2) - m + k - \beta}\} \{(u - x)^\alpha u^\beta \mathcal{F}(u)\} du \end{aligned}$$

will exist if the expressions within the brackets in the integrand belong to  $L_p(x, \infty)$  and  $L_q(x, \infty)$  respectively. The conditions for these are  $(- (1/2) - m - k - \alpha)q > -1$ ,  $(-1 - 2m - \alpha - \beta)q < -1$  and  $\alpha + \beta = 1 - 2/p$ ,  $\alpha p > -1$  which reduce to  $2m > -1/q$  and  $(1/2) - m - k > 0$ . Hence under these conditions the integral converges absolutely and we can change the order of integration. Therefore

$$\begin{aligned} K_{2m, (1/2) - m - k}^-[\mathcal{F}(x)] &= \frac{x^{2m}}{\Gamma((1/2) - m - k)} \int_0^\infty v^{-(1/2) - m - k} (x + v)^{-(1/2) - m + k} e^{-vt} \\ &\times \left\{ \int_0^\infty e^{-xt} \phi(t) dt \right\} dv = \frac{x^{2m}}{\Gamma((1/2) - m - k)} \int_0^\infty e^{-xt} \phi(t) \\ &\times \left\{ \int_0^\infty v^{-(1/2) - m - k} (x + v)^{-(1/2) - m + k} e^{-vt} dv \right\} dt \\ &= \int_0^\infty (xt)^{m - (1/2)} e^{-(1/2)xt} W_{k, -m}(xt) \phi(t) dt = F(x) \end{aligned}$$

as  $W_{k, -m}(x) = W_{k, m}(x)$ .

If  $p = 1$ , it is similarly seen that the change in the order of integration is justified if  $2m > 0$  and  $(1/2) - m - K > 0$ .

*Case II.*  $(1/2) - m - k < 0, 1 < p < \infty$ .

If  $\alpha < 0$  then the operator  $K_{\eta, \alpha}^- \{ \mathcal{F}(x) \}$  is defined as the solution, if any, of the integral equation  $\mathcal{F}(x) = K_{\eta + \alpha, -\alpha}^- \{ g(x) \}$ . Now

$$\begin{aligned} K_{(1/2) + m - k, -(1/2) + m + k}^- [F(x)] &= \frac{x^{(1/2) + m - k}}{\Gamma(-(1/2) + m + k)} \int_0^\infty (u - x)^{-(3/2) + m + k} u^{-2m} \\ &\times \left\{ \int_0^\infty (ut)^{m - (1/2)} e^{-(1/2)ut} W_{k, m}(ut) \phi(t) dt \right\} du . \end{aligned}$$

Again from a result of Hardy [5] we know that if

$$F(x) = \int_0^\infty K(xy) \phi(y) dy$$

then

$$\int_0^\infty x^{p-2} \{ F(x) \}^p dx < \left\{ \psi\left(\frac{1}{q}\right) \right\}^p \int_0^\infty \{ \phi(y) \}^p dy$$

where

$$\psi(s) = \int_0^\infty x^{s-1} K(x) dx .$$

If

$$K(x) = |x^{m-(1/2)}e^{-(1/2)x}W_{k,m}(x)|$$

then

$$\psi(s) = \frac{\Gamma(2m+s)\Gamma(s)}{\Gamma\left(m-k+\frac{1}{2}+s\right)}$$

by Goldstein's formula [4]. Therefore

$$\int_0^\infty x^{p-2}\{F(x)\}^p dx < \left\{ \frac{\Gamma\left(2m+\frac{1}{q}\right)\Gamma\left(\frac{1}{q}\right)}{\Gamma\left(m-k+\frac{1}{2}+\frac{1}{q}\right)} \right\}^p \int_0^\infty \{\phi(y)\}^p dy$$

provided that  $2m > -1/q$ , or  $x^{1-(2/p)}F(x) \in L_p(0, \infty)$  if  $\phi(y) \in L_p(0, \infty)$  ( $p > 1$ ). Hence  $(u-x)^\alpha u^\beta F(u) \in L_p(x, \infty)$  if  $\alpha + \beta = 1 - (2/p)$  and  $\alpha > -1/p$ . Also  $(u-x)^{-(3/2)+m+k-\alpha} u^{-2m-\beta} \in L_q(x, \infty)$  if  $-(3/2) + m + k - \alpha)q + 1 > 0$  and  $(-(3/2) - m + k - \alpha - \beta)q + 1 < 0$ . These four conditions reduce to  $m + k - (1/2) > 0$  and  $m - k + (1/2) > -1/q$ . So the integral  $\int_x^\infty (u-x)^{-(3/2)+m+k} u^{-2m} F(u) du$  exists under these conditions and

$$\begin{aligned} K_{(1/2)+m-k, -(1/2)+m+k}^- [F(x)] &= \frac{x^{(1/2)+m-K}}{\Gamma(-(1/2)+m+k)} \int_0^\infty t^{m-(1/2)} \phi(t) dt \\ &\times \int_x^\infty (u-x)^{m+k-(3/2)} u^{-m-(1/2)} e^{-(1/2)ut} W_{k,m}(ut) du \end{aligned}$$

on changing the order of integration which is permissible since the integral is absolutely convergent. But [4]

$$\int_x^\infty u^{\lambda-1} (u-x)^{k-\lambda-1} e^{-u/2} W_{k,m}(u) du = \Gamma(k-\lambda) x^{k-1} e^{-x/2} W_{\lambda,m}(x)$$

where  $k > \lambda$  and  $x$  is positive. Therefore

$$\begin{aligned} K_{(1/2)+m-k, -(1/2)+m+k}^- [F(x)] &= \int_0^\infty (xt)^{m-(1/2)} e^{-(xt/2)} W_{-m+(1/2), m}(xt) \phi(t) dt \\ &= \int_0^\infty e^{-xt} \phi(t) dt \end{aligned}$$

under the conditions  $m + k - (1/2) > 0$ ,  $m - k + (1/2) > -1/q$ ,  $x > 0$ .

If  $p = 1$ , the change in the order of integration is justified if  $m + K - (1/2) > 0$  and  $(1/2) + m - k > 0$ .

Hence  $K_{(1/2)+m-k, -(1/2)+m+k}^- [F(x)] = \mathcal{F}(x)$  and the theorem is proved.

**THEOREM 2.** *Under the conditions of Theorem 1 we have*

$$(5) \quad \int_0^\infty e^{-xt} I_{2m, (1/2)-m-k}^+ \{ \phi(t) \} dt = \int_0^\infty K_{2m, (1/2)-m-k}^- (e^{-xt}) \phi(t) dt .$$

This is a consequence of Theorem 2 of Erdélyi [3] and is proved similarly.

4. We are now in a position to give inversion and representation theorems for the transform.

We have seen that, under certain conditions,

$$K_{(1/2)+m-k, -(1/2)+m+k}^- [F(x)] = \mathcal{F}(x) .$$

Also  $\mathcal{F}(x)$  has derivatives of all orders for  $x$  sufficiently large and vanishes at infinity. So we can apply the Post-Widder operator  $L_{\lambda, u}$  defined by the relation

$$L_{\lambda, u} [\mathcal{F}(x)] = \frac{(-1)^\lambda}{\lambda!} \mathcal{F}^{(\lambda)} \left( \frac{\lambda}{u} \right) \left( \frac{\lambda}{u} \right)^{\lambda+1}$$

(where  $\lambda$  is a positive integer and  $u$  a real positive number) to  $\mathcal{F}(x)$  and obtain an inversion theorem.

LEMMA. If  $\phi(t) \in L_p$  in  $(0 \leq t < \infty)$  and

$$\phi(u) = \int_0^\infty | \phi(ut) - \phi(t) |^p dt$$

then

$$(i) \quad \left| \frac{u\phi(u)}{1+u} \right| \leq \| \phi \|_p^p \text{ for } u \geq 0$$

and

$$(ii) \quad \phi(u) \rightarrow 0 \text{ as } u \rightarrow 1$$

where  $\| \mathcal{F} \|_p$  denotes the norm of the function  $\mathcal{F}(t) \in L_p(0, \infty)$ , that is

$$\| \mathcal{F} \|_p = \left\{ \int_0^\infty | \mathcal{F}(t) |^p dt \right\}^{(1/p)} .$$

Proof. We have

$$| \phi(u) | \leq \int_0^\infty | \phi(ut) |^p dt + \int_0^\infty | \phi(t) |^p dt = \left( 1 + \frac{1}{u} \right) \int_0^\infty | \phi(t) |^p dt$$

which proves (i).

Also, by a change of variable,

$$\psi(e^y) = \int_{-\infty}^{\infty} |\phi(e^{x+y}) - \phi(e^x)|^p e^x dx .$$

If  $\alpha(x) = e^{(x/p)}\phi(e^x)$  then

$$\int_{-\infty}^{\infty} |\alpha(x)|^p dx = \int_{-\infty}^{\infty} |\phi(e^x)|^p e^x dx = \|\phi\|_p^p$$

and so  $\alpha(x) \in L_p(-\infty, \infty)$ . Again

$$\begin{aligned} \{\psi(e^y)\}^{1/p} &= \left[ \int_{-\infty}^{\infty} \{ \alpha(x+y)e^{-(y/p)} - \alpha(x)e^{-(y/p)} \} \right. \\ &\quad \left. + \{ \alpha(x)e^{-(y/p)} - \alpha(x) \} |^p dx \right]^{1/p} \\ &\leq e^{-(y/p)} \left[ \int_{-\infty}^{\infty} |\alpha(x+y) - \alpha(x)|^p dx \right]^{1/p} \\ &\quad + |e^{-(y/p)} - 1| \left[ \int_{-\infty}^{\infty} |\alpha(x)|^p dx \right]^{1/p} \end{aligned}$$

by Minkowski's inequality. And  $\int_{-\infty}^{\infty} |\alpha(x+y) - \alpha(x)|^p dx \rightarrow 0$  as  $y \rightarrow 0$  if  $\alpha(x) \in L_p(-\infty, \infty)$  and so does  $|e^{-y/p} - 1|$ . Therefore  $\psi(e^y) = o(1)$  as  $y \rightarrow 0$  or  $\psi(u) \rightarrow 0$  as  $u \rightarrow 1$ .

**THEOREM 3.** Assume  $\phi(t) \in L_p$  ( $1 \leq p < \infty$ ) in  $0 \leq t \leq R$  for every positive  $R$ . If the integral  $\mathcal{F}(x)$  converges for  $x > 0$  and  $2m > -1/q$  when  $(1/2) - m - k > 0$ ;  $(1/2) + m - k > -1/q$  when  $(1/2) - m - k < 0$ , then, for almost all positive  $t$ ,

$$\lim_{\lambda \rightarrow \infty}^{\text{index } p} L_{\lambda, t} [K_{(1/2)+m-k, -(1/2)+m+k}^- \{F(x)\}] = \phi(t) .$$

*Proof.* We have seen in the proof of Theorem 1 that, under the conditions of the theorem,

$$K_{(1/2)+m-k, -(1/2)+m+k}^- \{F(x)\} = \mathcal{F}(x) .$$

Therefore

$$\begin{aligned} L_{\lambda, t} &\equiv L_{\lambda, t} [K_{(1/2)+m-k, -(1/2)+m+k}^- \{F(x)\}] \\ &= \frac{1}{\lambda!} \left(\frac{\lambda}{t}\right)^{\lambda+1} \int_0^{\infty} e^{-(\lambda u/t)} u^{\lambda} \phi(u) du \end{aligned}$$

by simple computation and

$$\begin{aligned} |L_{\lambda, t} - \phi(t)| &\leq \frac{1}{\lambda!} \left(\frac{\lambda}{t}\right)^{\lambda+1} \int_0^{\infty} e^{-(\lambda u/t)} u^{\lambda} |\phi(u) - \phi(t)| du \\ &= \frac{1}{\lambda!} \lambda^{\lambda+1} \int_0^{\infty} e^{-\lambda v} v^{\lambda} |\phi(vt) - \phi(t)| dv . \end{aligned}$$

Therefore

$$\begin{aligned}
 |L_{\lambda,t} - \phi(t)|^p &\leq \left| \frac{\lambda^{\lambda+1}}{\lambda!} \int_0^\infty e^{-\lambda v} v^\lambda |\phi(vt) - \phi(t)|^p dv \right|^p \\
 &\leq \left[ \frac{\lambda^{\lambda+1}}{\lambda!} \int_0^\infty e^{-\lambda v} v^\lambda |\phi(vt) - \phi(t)|^p dv \right] \left[ \frac{\lambda^{\lambda+1}}{\lambda!} \int_0^\infty e^{-\lambda v} v^\lambda dv \right]^{p/q} \\
 &\quad \frac{\lambda^{\lambda+1}}{\lambda!} \int_0^\infty e^{-\lambda v} v^\lambda |\phi(vt) - \phi(t)|^p dv .
 \end{aligned}$$

Hence

$$\begin{aligned}
 \int_0^\infty |L_{\lambda,t} - \phi(t)|^p dt &\leq \frac{\lambda^{\lambda+1}}{\lambda!} \int_0^\infty dt \int_0^\infty e^{-\lambda v} v^\lambda |\phi(vt) - \phi(t)|^p dv \\
 &= \frac{\lambda^{\lambda+1}}{\lambda!} \int_0^\infty e^{-\lambda v} v^\lambda dv \left\{ \int_0^\infty |\phi(vt) - \phi(t)|^p dt \right\} .
 \end{aligned}$$

In changing the order of integration, this becomes

$$(6) \quad \frac{\lambda^{\lambda+1}}{\lambda!} \int_0^\infty e^{-\lambda v} v^\lambda \psi(v) dv$$

where  $\psi(v)$  is defined as in the lemma. From the lemma it is easily seen that

$$\begin{aligned}
 \psi(u) &= 0(1) \quad (u \rightarrow \infty) \\
 &= 0(u^{-1}) \quad (u \rightarrow 0+) .
 \end{aligned}$$

Therefore  $\int_0^\infty e^{-\lambda v} v^\lambda \psi(v) dv$  converges for  $\lambda \geq 1$  and the inversion of the order of integration is justified by Fubini's theorem. By a familiar result [9, Theorem 3c, p. 283] the integral (6) approaches  $\psi(1)$  as  $\lambda \rightarrow \infty$ . But, by the lemma,  $\psi(u) = o(1)$  as  $u \rightarrow 1$ . Therefore  $L_{\lambda,t}$  converges in mean to  $\phi(t)$  with index  $p$  on  $0 \leq t < \infty$  and the result is proved.

**THEOREM 4.** *The necessary and sufficient conditions for a function  $F(x)$  to have the representation (2) with  $\phi(t) \in L_p(0, \infty)$ ,  $p \geq 1$ ,  $x > 1$ , and with  $2m > -1/q$  when  $1/2 - m - K > 0$  and  $m - k + 1/2 > -1/q$  when  $1/2 - m - k < 0$  are*

- (i)  $K_{1/2+m-k, -1/2+m+k}^- \{F(x)\} \equiv G(x)$  exists, has derivatives of all orders in  $0 < x < \infty$  and vanishes at infinity and
- (ii) there exist constants  $M$  and  $p$  ( $p \geq 1$ ) such that

$$\int_0^\infty |L_{\lambda,t}[G(x)]|^p dt < M \quad (\lambda = 1, 2, \dots) .$$

*Proof.* First let  $F(x)$  have the representation (2). Then, from Theorem 1,

$$G(x) \equiv K_{1/2+m-k, -1/2+m+k}^- \{F(x)\} = \mathcal{F}(x)$$

and as in the proof of Widder [9, Theorem 15a, pp. 313-14] we see that the conditions are satisfied.

Conversely, let the conditions be satisfied. Then again, as in the proof of Widder's theorem referred to before, we see that

$$G(x) = \int_0^\infty e^{-xt} \phi(t) dt = \mathcal{F}(x).$$

Therefore [3, p. 300]

$$\begin{aligned} F(x) &= (K_{(1/2)+m-k, -(1/2)+m+k}^-)^{-1} \mathcal{F}(x) = K_{2m, 1/2-m-k}^- \{ \mathcal{F}(x) \} \\ &= \int_0^\infty (xt)^{m-1/2} e^{-xt/2} W_{K, m}(xt) \phi(t) dt \end{aligned}$$

by Theorem 1; and the theorem is proved.

COROLLARY. *If the fractional derivatives or integrals*

$$K_{(1/2)+m-k+r, -(1/2)+m+k-r}^- \{F(x)\}$$

*exist for  $r = 0$  and every positive integer, then the integral in the condition (ii) of Theorem 4 can be replaced by*

$$\int_0^\infty \left| \frac{(-1)^\lambda}{\lambda!} \left( \frac{\lambda}{t} \right) \sum_{r=0}^\lambda (-1)^r A_r K_{(1/2)+m-k+r, (1/2)+m+k-r}^- \left\{ F\left( \frac{\lambda}{t} \right) \right\} \right|^p dt$$

where

$$\begin{aligned} A_r &= {}^\lambda C_r (m-k+(1/2))(m-k-(1/2)) \cdots (m-k-\lambda+(3/2)+r) \\ &(r = 0, 1, \dots, \lambda-1), \quad A_\lambda = 1. \end{aligned}$$

For [6]

$$t^a K_{\xi, \alpha}^- \{ \mathcal{F}(t) \} = K_{\xi+a, \alpha}^- \{ t^a \mathcal{F}(t) \}.$$

Therefore

$$K_{\xi, \alpha}^- \{ F(x) \} = x^\xi K_{0, \alpha}^- \{ x^{-\xi} F(x) \}$$

and

$$\begin{aligned} \frac{d^\lambda}{dx^\lambda} \left[ K_{\xi, \alpha}^- \{ F(x) \} \right] &= \frac{d^\lambda}{dx^\lambda} (x^\xi) \left[ K_{0, \alpha}^- \{ x^{-\xi} F(x) \} \right] \\ &+ {}^\lambda C_1 \frac{d^{\lambda-1}}{dx^{\lambda-1}} (x^\xi) \frac{d}{dx} \left[ K_{0, \alpha}^- \{ x^{-\xi} F(x) \} \right] + \dots \\ &+ {}^\lambda C_{\lambda-1} \frac{d}{dx} (x^\xi) \frac{d^{\lambda-1}}{dx^{\lambda-1}} \left[ K_{0, \alpha}^- \{ x^{-\xi} F(x) \} \right] \\ &+ x^\xi \frac{d^\lambda}{dx^\lambda} \left[ K_{0, \alpha}^- \{ x^{-\xi} F(x) \} \right]. \end{aligned}$$

By Leibnitz's theorem this becomes

$$\begin{aligned} &= \zeta(\zeta - 1) \cdots (\zeta - \lambda + 1)x^{\zeta-\lambda}[K_{0,\alpha}^- \{x^{-\zeta}F(x)\}] \\ &- {}^\lambda C_1 \zeta(\zeta - 1) \cdots (\zeta - \lambda + 2)x^{\zeta-\lambda+1}[K_{0,\alpha-1}^- \{x^{-\zeta-1}F(x)\}] \\ &+ \cdots + (-1)^\lambda x^\zeta [K_{0,\alpha-\lambda}^- \{x^{-\zeta-\lambda}F(x)\}]. \end{aligned}$$

Therefore

$$\begin{aligned} &\frac{(-1)^\lambda x^{\lambda+1}}{\lambda!} \frac{d^\lambda}{dx^\lambda} \left[ K_{\zeta,\alpha}^- \{F(x)\} \right] \\ &= \frac{(-1)^\lambda}{\lambda!} \sum_{r=0}^{\lambda} (-1)^r A_r x^{\zeta+r+1} \left[ K_{0,\alpha-r}^- \{x^{-\zeta-r}F(x)\} \right] \end{aligned}$$

where

$$\begin{aligned} A_r &= {}^\lambda C_r \zeta(\zeta - 1) \cdots (\zeta - \lambda + r + 1) \\ A_\lambda &= 1, \end{aligned} \quad (r = 0, 1, \dots, \lambda - 1),$$

and

$$\begin{aligned} L_{\lambda,t} \left[ K_{\zeta,\alpha}^- \{F(x)\} \right] &= \frac{(-1)^\lambda}{\lambda!} \sum_{r=0}^{\lambda} (-1)^r A_r \left( \frac{\lambda}{t} \right)^{\zeta+r+1} \left[ K_{0,\alpha-r}^- \left\{ \left( \frac{\lambda}{t} \right)^{-\zeta-r} F \left( \frac{\lambda}{t} \right) \right\} \right] \\ &= \frac{(-1)^\lambda}{\lambda!} \left( \frac{\lambda}{t} \right) \sum_{r=0}^{\lambda} (-1)^r A_r \left[ K_{\zeta+r,\alpha-r}^- \left\{ F \left( \frac{\lambda}{t} \right) \right\} \right]. \end{aligned}$$

Putting  $\zeta = m - k + 1/2$  and  $\alpha = m + k - 1/2$  we have the required result.

**THEOREM 5a.** *If  $F(x)$  has representation (2) with the conditions of Theorem 4 on  $\phi(t)$ ,  $x$ ,  $k$  and  $m$  satisfied and if the fractional derivatives or integrals  $K_{(1/2)+m-k+r, (-1/2)+m+k-r}^- \{F(x)\}$  exist for  $r = 0$  and every positive integer, then*

$$\lim_{\lambda \rightarrow \infty} \int_0^\infty \left| \frac{(-1)^\lambda}{\lambda!} \left( \frac{\lambda}{t} \right) \sum_{r=0}^{\lambda} (-1)^r A_r \left[ K_{(1/2)+m-k+r, (-1/2)+m+k-r}^- \left\{ F \left( \frac{\lambda}{t} \right) \right\} \right] \right|^p dt = \left\| \phi \right\|_p^p.$$

where the  $A_r$ 's have values as in the Corollary to Theorem 4.

*Proof.* The proof is similar to that of Widder [9, Theorem 15b, p. 314]

**THEOREM 5b.** *If the function  $F(x)$  has representation (2) with the conditions of Theorem 4 on  $\phi(t)$ ,  $x$ ,  $k$  and  $m$  satisfied, then*

$$\lim_{\lambda \rightarrow \infty} \int_0^\infty |L_{\lambda,t} \{F(x)\}|^p dt = \int_0^\infty |I_{2m, (1/2)-m-k}^+ \{\phi(t)\}|^p dt.$$

*Proof.* If  $F(x)$  has the representation (2), then, by Theorem 2 we have

$$F(x) = \int_0^{\infty} e^{-xt} I_{2m, (1/2) - m - k}^+ \{\phi(t)\} dt .$$

Also if  $\phi(t) \in L_p(0, \infty)$  so does  $I_{2m, (1/2) - m - k}^+ \{\phi(t)\}$  provided that  $2m > -1/q$ .

Therefore, as in Widder [9, Theorem 15b, p. 314], we can prove again that

$$\lim_{\lambda \rightarrow \infty} \int_0^{\infty} |L_{\lambda, t} \{F(x)\}|^p dt = \int_0^{\infty} |I_{2m, (1/2) - m - k}^+ \{\phi(t)\}|^p dt .$$

I am deeply grateful to Professor A. Erdélyi for many helpful suggestions.

Mathematical papers intended for publication in the *Pacific Journal of Mathematics* should be typewritten (double spaced), and the author should keep a complete copy. Manuscripts may be sent to any of the editors. All other communications to the editors should be addressed to the managing editor, E. G. Straus at the University of California, Los Angeles 24, California.

50 reprints per author of each article are furnished free of charge; additional copies may be obtained at cost in multiples of 50.

---

The *Pacific Journal of Mathematics* is published quarterly, in March, June, September, and December. The price per volume (4 numbers) is \$12.00; single issues, \$3.50. Back numbers are available. Special price to individual faculty members of supporting institutions and to individual members of the American Mathematical Society: \$4.00 per volume; single issues, \$1.25.

Subscriptions, orders for back numbers, and changes of address should be sent to Pacific Journal of Mathematics, 2120 Oxford Street, Berkeley 4, California.
