# RADIAL DISTRIBUTION AND DEFICIENCIES OF THE VALUES OF A MEROMORPHIC FUNCTION

ALBERT EDREI<sup>1</sup>, WOLFGANG H. J. FUCHS<sup>2</sup>  
AND SIMON HELLERSTEIN

**Introduction.** Let  $f(z)$  be a meromorphic function. Throughout this note we make the following conventions.

I.  $f(0) = 1$ ; this simplifies the exposition without affecting the generality of the results.

II. We denote by

$$a_1, a_2, a_3, \dots$$

the sequence of the zeros of  $f(z)$  and by

$$b_1, b_2, b_3, \dots$$

the sequence of its poles.

The moduli of the terms of these two sequences are taken to be nondecreasing and each zero or pole appears as often as indicated by its multiplicity.

III. The standard symbols of Nevanlinna's theory:

$$\log^+, m(r, f), \log M(r, f), n(r, f), N(r, f), T(r, f), \delta(\tau, f)$$

are used systematically; familiarity with their meaning is assumed.

We investigate here the following problem, a special case of which has already been mentioned by two of the authors [1; p. 295]:

*To find sequences  $\{a_\mu\}$ ,  $\{b_\nu\}$  such that if  $f(z)$  is a meromorphic function with zeros  $\{a_\mu\}$  and poles  $\{b_\nu\}$  (and no other zeros or poles), then*

$$(1) \quad \delta(0, f) > 0, \quad \delta(\infty, f) > 0.$$

The results of the present note show that a simple behavior of the arguments of the zeros and poles is almost sufficient to induce the inequalities (1). We prove

**THEOREM 1.** *Let  $f(z)$  be a meromorphic function with positive zeros and negative poles.*

Assume that

$$(2) \quad \sum_{\mu} \frac{1}{a_{\mu}} + \sum_{\nu} \frac{1}{|b_{\nu}|} = +\infty,$$

and that

$$(3) \quad \sum_{\mu} \frac{1}{a_{\mu}^{\xi}} + \sum_{\nu} \frac{1}{|b_{\nu}|^{\xi}} < +\infty,$$

for some finite positive value of  $\xi$ .

Then

$$(4) \quad \limsup_{r \rightarrow \infty} \frac{N\left(r, \frac{1}{f}\right) + N(r, f)}{T(r, f)} \leq \frac{1}{1+A},$$

where  $A (> 0)$  is an absolute constant.

If the condition (3) is omitted, we still have

$$(5) \quad \limsup_{r \rightarrow \infty} \frac{N\left(r, \frac{1}{f}\right) + N(r, f)}{T(r, f)} \leq 1.$$

COROLLARY 1.1. The assumptions of Theorem 1 imply

$$\delta(0, f) \geq \frac{A}{1+A}, \quad \delta(\infty, f) \geq \frac{A}{1+A}.$$

If the condition (3) is omitted, but

$$0 < \alpha \leq \liminf_{r \rightarrow \infty} \frac{N(r, f)}{N\left(r, \frac{1}{f}\right)} \leq \limsup_{r \rightarrow \infty} \frac{N(r, f)}{N\left(r, \frac{1}{f}\right)} \leq \frac{1}{\beta} < +\infty,$$

we still have

$$\delta(0, f) \geq \frac{\alpha}{1+\alpha}, \quad \delta(\infty, f) \geq \frac{\beta}{1+\beta}.$$

COROLLARY 1.2. Let  $f(z)$  be an entire function with real zeros. If

$$(6) \quad \sum_{\mu} \frac{1}{|a_{\mu}|^2} = +\infty,$$

and if

$$(7) \quad \sum_{\mu} \frac{1}{|a_{\mu}|^{\xi}} < +\infty,$$

for some finite positive value of  $\xi$ , then

$$(8) \quad \delta(0, f) \geq \frac{A}{1 + A},$$

where  $A$  is the absolute constant in (4).

The condition (2) of Theorem 1 cannot be omitted; we shall see that the theorem does not hold for certain meromorphic functions of finite order, with positive poles and such that

$$\sum_{\mu} \frac{1}{a_{\mu}^{\kappa}} + \sum_{\nu} \frac{1}{|b_{\nu}|^{\kappa}} = +\infty,$$

for every  $\kappa$  less than one.

Similarly, Corollary 1.2 does not hold for certain entire functions of finite order, with real zeros and such that

$$\sum_{\mu} \frac{1}{|a_{\mu}|^{\kappa}} = +\infty,$$

for every  $\kappa$  less than two.

The conditions (3) and (7) are used essentially in our proofs, but it is possible that our results hold without such restrictions. This conjecture is plausible if we observe that the assertions (4) and (8) do not contain the parameter  $\xi$ .

Our method gives a little more than has been stated. In the special case of entire functions it yields

**THEOREM 2.** *Let  $f(z)$  be entire. Assume that all its zeros  $a_{\mu}$  lie on the radii defined by*

$$re^{i\omega_0}, re^{i\omega_1}, \dots, re^{i\omega_m} \quad (r > 0),$$

where the  $\omega$ 's are real.

Then, there exists a positive constant  $K$ , depending only on the  $\omega$ 's, and such that the condition

$$(9) \quad \sum_{\mu} \frac{1}{|a_{\mu}|^K} = +\infty,$$

and the condition

$$(10) \quad \sum_{\mu} \frac{1}{|a_{\mu}|^{\xi}} < +\infty,$$

for some finite value of  $\xi$ , imply

$$(11) \quad \delta(0, f) \geq \frac{A}{1 + A},$$

where  $A$  is the absolute constant in (4).

All the previous theorems and corollaries assert that 0 and  $\infty$  are among the deficient values of certain functions  $f(z)$ .

Hence, by Theorem 4 of [1], the lower order  $\mu$ , of  $f(z)$  is positive<sup>3</sup>.

Assume now that  $h(z)$  denotes a meromorphic function which does not vanish identically, is of order less than  $\mu$ , but is otherwise arbitrary. Then, by elementary inequalities of Nevanlinna's theory,

$$T(r, hf) \asymp T(r, f) ,$$

$$\frac{m(r, fh)}{T(r, fh)} = \frac{m(r, f)}{T(r, f)} + o(1), \quad \frac{m\left(r, \frac{1}{fh}\right)}{T(r, fh)} = \frac{m\left(r, \frac{1}{f}\right)}{T(r, f)} + o(1) ,$$

and hence

$$\delta(0, fh) = \delta(0, f) , \quad \delta(\infty, fh) = \delta(\infty, f) .$$

This shows that our theorems remain true even if infinitely many zeros and poles have unknown arguments but are sufficiently rare.

It will be shown in [2] that a radial distribution of zeros and poles makes it, in general, impossible for the function to have other deficient values than 0 and  $\infty$ . Combining the results of [2] with those of the present investigation, it is possible to obtain information concerning *all* the deficient values of certain interesting classes of functions. The following result is one of the simplest which may be obtained in this way.

*Let  $f(z)$  be an entire function of finite order  $\lambda$ . Assume that all the zeros of  $f(z)$  are real and that  $\lambda > 2$ .*

*Then (11) holds and*

$$\delta(\tau, f) = 0 ,$$

for  $\tau \neq 0, \tau \neq \infty$ .

### 1. Consequences of an identity of Nevanlinna.

**LEMMA 1.** *Let  $f(z)$  be meromorphic with zeros  $\{a_\mu\}$  and poles  $\{b_\nu\}$ . Assume*

$$(1.1) \quad |\arg a_\mu| \leq \gamma < \frac{\pi}{2} \quad (\mu = 1, 2, 3, \dots);$$

$$(1.2) \quad |\arg b_\nu - \pi| \leq \gamma < \frac{\pi}{2} \quad (\nu = 1, 2, 3, \dots);$$

---

<sup>3</sup> A direct study of the lower order of our functions will be found in [2]. For the functions in Theorem 1 and its Corollaries, this study yields "best possible" bounds for  $\mu$ .

$$(1.3) \quad \sum_{\mu} \frac{1}{|a_{\mu}|} + \sum_{\nu} \frac{1}{|b_{\nu}|} = +\infty.$$

Then, for  $r$  large enough,

$$(1.4) \quad \frac{1}{2\pi} \int_0^{2\pi} \log |f(re^{i\theta})| \cos \theta d\theta \geq \cos \gamma \left\{ N\left(r, \frac{1}{f}\right) + N(r, f) \right\}.$$

*Proof.* Put  $q = 0, z = 0$  in a well-known identity of R. Nevanlinna [3; p. 222]. Adapting the formula to our notation, we obtain

$$(1.5) \quad \frac{1}{2\pi} \int_0^{2\pi} \log |f(re^{i\theta})| e^{-i\theta} d\theta = \frac{r}{2} \left\{ \sum_{|a_{\mu}| \leq r} \left( \frac{1}{a_{\mu}} - \frac{\overline{a_{\mu}}}{r^2} \right) - \sum_{|b_{\nu}| \leq r} \left( \frac{1}{b_{\nu}} - \frac{\overline{b_{\nu}}}{r^2} \right) \right\} + \frac{f'(0)}{f(0)} \frac{r}{2},$$

and hence, in view of the assumptions (1.1) and (1.2)

$$(1.6) \quad \frac{1}{2\pi} \int_0^{2\pi} \log |f(re^{i\theta})| \cos \theta d\theta \geq \frac{r}{2} \cos \gamma \left\{ \sum_{|a_{\mu}| \leq r} \left( \frac{1}{|a_{\mu}|} - \frac{|a_{\mu}|}{r^2} \right) + \sum_{|b_{\nu}| \leq r} \left( \frac{1}{|b_{\nu}|} - \frac{|b_{\nu}|}{r^2} \right) \right\} - \left| \frac{f'(0)}{f(0)} \right| \frac{r}{2}.$$

An elementary evaluation yields

$$(1.7) \quad \frac{r}{2} \sum_{|a_{\mu}| \leq r} \left( \frac{1}{|a_{\mu}|} - \frac{|a_{\mu}|}{r^2} \right) = N\left(r, \frac{1}{f}\right) + \frac{r}{2} \int_0^r N(x, \frac{1}{f}) \left( \frac{1}{x^2} - \frac{1}{r^2} \right) dx.$$

Using (1.7) (and the analogous formula for poles) in (1.6), we obtain

$$(1.8) \quad \frac{1}{2\pi} \int_0^{2\pi} \log |f(re^{i\theta})| \cos \theta d\theta \geq \cos \gamma \left\{ N\left(r, \frac{1}{f}\right) + N(r, f) \right\} + \frac{r}{2} \left\{ \cos \gamma \int_0^r \left\{ N\left(x, \frac{1}{f}\right) + N(x, f) \right\} \left( \frac{1}{x^2} - \frac{1}{r^2} \right) dx - \left| \frac{f'(0)}{f(0)} \right| \right\}.$$

If  $r$  is large enough, this implies (1.4) since, by our assumption (1.3), the integral in the right-hand side of (1.8) tends to  $+\infty$  as  $r \rightarrow +\infty$ .

## 2. Lower bounds for $m(r, f)$ .

**LEMMA 2.** *Let  $g(z)$  be an absolutely convergent product of primary factors of genus 2.*

*Assume that the zeros of  $g(z)$  lie in the sector  $\Delta(\varepsilon)$  defined by*

$$(2.1) \quad |\arg z| \leq \frac{\pi}{6} - \varepsilon \quad \left( 0 < \varepsilon \leq \frac{\pi}{6} \right).$$

Then

$$(2.2) \quad \int_{(\pi/3) - (\varepsilon/2)}^{(\pi/3) + (\varepsilon/2)} \log^+ \left| \frac{g(re^{i\theta})}{g(-re^{i\theta})} \right| d\theta \geq 2\varepsilon \sin \frac{\varepsilon}{2} r^3 \int_0^\infty \frac{n\left(t, \frac{1}{g}\right)}{t^2(t^2 + r^2)} dt .$$

*Proof.* Let

$$E(u, q) = (1 - u) \exp\left(u + \frac{u^2}{2} + \dots + \frac{u^q}{q}\right),$$

denote the primary factor of genus  $q$ ; we write  $E(u)$  instead of  $E(u, 2)$ .

It follows from the definitions that

$$\log \frac{E(u)}{E(-u)} = \log \left( \frac{1 - u}{1 + u} \right) + 2u = 2 \int_0^u \frac{t^2}{t^2 - 1} dt ,$$

and hence, if

$$(2.3) \quad \begin{aligned} u &= re^{i\phi}, \quad \phi \not\equiv 0 \pmod{\pi}, \\ \log \left| \frac{E(re^{i\phi})}{E(-re^{i\phi})} \right| &= 2 \int_0^r \frac{x^4 \cos \phi - x^2 \cos 3\phi}{x^4 - 2x^2 \cos 2\phi + 1} dx . \end{aligned}$$

Let  $\{c_\nu\}$  be the sequence of the zeros of  $g(z)$ ; putting

$$\theta_\nu = \arg c_\nu ,$$

we have, by assumption

$$(2.4) \quad |\theta_\nu| \leq \frac{\pi}{6} - \varepsilon .$$

If  $z (= re^{i\theta})$  is confined to the sector

$$(2.5) \quad \left| \theta - \frac{\pi}{3} \right| \leq \frac{\varepsilon}{2} ,$$

(2.3), (2.4) and (2.5) yield

$$\begin{aligned} \log \left| \frac{E\left(\frac{z}{c_\nu}\right)}{E\left(\frac{-z}{c_\nu}\right)} \right| &= 2 \int_0^{r/|c_\nu|} \frac{x^4 \cos(\theta - \theta_\nu) - x^2 \cos 3(\theta - \theta_\nu)}{x^4 - 2x^2 \cos 2(\theta - \theta_\nu) + 1} dx \\ &\geq 2 \sin \frac{\varepsilon}{2} \int_0^{r/|c_\nu|} \frac{x^2}{1 + x^2} dx . \end{aligned}$$

Hence, in the region defined by (2.5)

$$\begin{aligned}
 (2.6) \quad \log^+ \left| \frac{g(re^{i\theta})}{g(-re^{i\theta})} \right| &\geq 2 \sin \frac{\varepsilon}{2} \sum_{\nu=1}^{\infty} \int_0^{r/|c_\nu|} \frac{x^2}{1+x^2} dx \\
 &= 2 \sin \frac{\varepsilon}{2} r^3 \int_0^{\infty} \frac{n\left(t, \frac{1}{g}\right)}{t^2(t^2+r^2)} dt
 \end{aligned}$$

and this clearly implies (2.2).

LEMMA 3. Let  $f(z)$  be a meromorphic function of genus not greater than 2.

Assume

- (i) that its zeros  $\{a_\mu\}$  lie in the region  $\Delta(\varepsilon)$  defined by (2.1);
- (ii) that its poles  $\{b_\nu\}$  lie in the region  $\Delta^*(\varepsilon)$  defined by

$$|\arg z - \pi| \leq \frac{\pi}{6} - \varepsilon \quad \left(0 < \varepsilon \leq \frac{\pi}{6}\right);$$

$$(iii) \quad \sum_{\mu} \frac{1}{|a_\mu|} + \sum_{\nu} \frac{1}{|b_\nu|} = +\infty.$$

Then

$$\begin{aligned}
 (2.7) \quad \frac{1}{2\pi} \int_{(\pi/3)-(\varepsilon/2)}^{(\pi/3)+(\varepsilon/2)} \log^+ \left| \frac{f(re^{i\theta})}{f(-re^{i\theta})} \right| d\theta \\
 \geq \frac{(1-\eta(r))}{2\pi} \varepsilon \sin \frac{\varepsilon}{2} \left\{ N\left(r, \frac{1}{f}\right) + N(r, f) \right\},
 \end{aligned}$$

where  $\eta(r) \rightarrow 0$  as  $r \rightarrow +\infty$ .

*Proof.* Since the genus of  $f(z)$  does not exceed 2, it is possible to represent the function by

$$(2.8) \quad f(z) = e^{P(z)} \frac{\Pi E\left(\frac{z}{a_\mu}, 2\right)}{\Pi E\left(\frac{z}{b_\nu}, 2\right)},$$

where the polynomial  $P(z)$  is of degree not greater than 2 [it is obvious that the infinite products in (2.8) are not necessarily canonical].

Clearly

$$(2.9) \quad \frac{f(z)}{f(-z)} = e^{2P'(0)z} \frac{g(z)}{g(-z)},$$

where

$$(2.10) \quad g(z) = \Pi E\left(\frac{z}{a_\mu}, 2\right) \Pi E\left(-\frac{z}{b_\nu}, 2\right).$$

By (2.9)

$$\log^+ \left| \frac{f(re^{i\theta})}{f(-re^{i\theta})} \right| \geq \log^+ \left| \frac{g(re^{i\theta})}{g(-re^{i\theta})} \right| - 2 |P'(0)| r,$$

and the assumptions (i) and (ii) of Lemma 3 enable us to apply Lemma 2 to the function defined by (2.10). We thus obtain

$$(2.11) \quad \int_{(\pi/3) - (\varepsilon/2)}^{(\pi/3) + (\varepsilon/2)} \log^+ \left| \frac{f(re^{i\theta})}{f(-re^{i\theta})} \right| d\theta \\ \geq 2\varepsilon \sin \frac{\varepsilon}{2} r^3 \int_0^\infty \frac{n\left(t, \frac{1}{f}\right) + n(t, f)}{t^2(t^2 + r^2)} dt - 2\varepsilon |P'(0)| r.$$

Now

$$r^3 \int_0^\infty \frac{n\left(t, \frac{1}{f}\right) + n(t, f)}{t^2(t^2 + r^2)} dt > \frac{r}{2} \int_0^r \frac{n\left(t, \frac{1}{f}\right) + n(t, f)}{t^2} dt,$$

and by assumption (iii) the latter integral tends to  $+\infty$  as  $r \rightarrow +\infty$ . Hence (2.11) yields

$$(2.12) \quad \frac{1}{2\pi} \int_{(\pi/3) - (\varepsilon/2)}^{(\pi/3) + (\varepsilon/2)} \log^+ \left| \frac{f(re^{i\theta})}{f(-re^{i\theta})} \right| d\theta \\ \geq (1 - \eta(r)) \frac{\varepsilon}{\pi} \sin \frac{\varepsilon}{2} r^3 \int_0^\infty \frac{n(t)}{t^2(t^2 + r^2)} dt,$$

where

$$n(t) = n\left(t, \frac{1}{f}\right) + n(t, f),$$

and  $\eta(r) \rightarrow 0$  as  $r \rightarrow +\infty$ .

Putting

$$N(t) = \int_0^t \frac{n(x)}{x} dx,$$

an integration by parts and obvious estimates yield

$$\int_0^\infty \frac{n(t)}{t^2(t^2 + r^2)} dt = \int_0^\infty N(t) d\left\{-\frac{1}{t(t^2 + r^2)}\right\} \\ \geq N(r) \int_r^\infty d\left\{-\frac{1}{t(t^2 + r^2)}\right\} = \frac{N(r)}{2r^3}.$$

Using the latter estimate in (2.12), we obtain (2.7).

LEMMA 4. *If, in Lemma 3, we restrict the value of the parameter  $\varepsilon$  by the inequalities*

$$(2.13) \quad \frac{9}{10} \frac{\pi}{6} \leq \varepsilon \leq \frac{\pi}{6},$$

then, for all sufficiently large values of  $r$ ,

$$(2.14) \quad T(r, f) \geq (1 + A) \left\{ N\left(r, \frac{1}{f}\right) + N(r, f) \right\},$$

where  $A(> 0)$  is an absolute constant.

The inequality (2.14) still holds if  $f(z)$  is replaced by  $F(z)$ :

$$(2.15) \quad F(z) = e^{S(z)} f(z)$$

where  $S(z)$  is an entire function (which may reduce to a polynomial).

*Proof.* We apply Lemma 1 to the function  $f(z)/f(-z)$  (instead of  $f(z)$ ). By (2.13) and the definition of  $\Delta(\varepsilon)$  and  $\Delta^*(\varepsilon)$ , we obtain, for large values of  $r$ ,

$$\frac{1}{2\pi} \int_0^{2\pi} \log \left| \frac{f(re^{i\theta})}{f(-re^{i\theta})} \right| \cos \theta d\theta \geq \cos\left(\frac{\pi}{60}\right) \left\{ 2N\left(r, \frac{1}{f}\right) + 2N(r, f) \right\}.$$

Hence, in view of the trivial relation

$$\frac{1}{2\pi} \int_0^{2\pi} \log \left| \frac{f(-re^{i\theta})}{f(re^{i\theta})} \right| d\theta = 0$$

we find, for  $r$  large enough,

$$\frac{1}{2\pi} \int_0^{2\pi} \log \left| \frac{f(-re^{i\theta})}{f(re^{i\theta})} \right| (1 - \cos \theta) d\theta \geq 2 \cos \frac{\pi}{60} \left\{ N\left(r, \frac{1}{f}\right) + N(r, f) \right\},$$

$$\begin{aligned} 2m\left(r, \frac{f(-z)}{f(z)}\right) &\geq \frac{1}{2\pi} \int_0^{2\pi} \log^+ \left| \frac{f(re^{i\theta})}{f(-re^{i\theta})} \right| (1 - \cos \theta) d\theta \\ &\quad + 2 \cos \frac{\pi}{60} \left\{ N\left(r, \frac{1}{f}\right) + N(r, f) \right\}, \end{aligned}$$

$$(2.16) \quad \begin{aligned} 2m\left(r, \frac{f(-z)}{f(z)}\right) &\geq \left(1 - \cos \frac{\pi}{4}\right) \frac{1}{2\pi} \int_{(\pi/3) - (\varepsilon/2)}^{(\pi/3) + (\varepsilon/2)} \log^+ \left| \frac{f(re^{i\theta})}{f(-re^{i\theta})} \right| d\theta \\ &\quad + 2 \cos \frac{\pi}{60} \left\{ N\left(r, \frac{1}{f}\right) + N(r, f) \right\}. \end{aligned}$$

Using (2.7) and inequalities for the means of Nevanlinna, (2.16) yields

$$m(r, f(z)) + m\left(r, \frac{1}{f(z)}\right) \geq \left\{ (1 - \eta(r)) \frac{\left(1 - \cos \frac{\pi}{4}\right)}{4\pi} \varepsilon \sin \frac{\varepsilon}{2} + \cos \frac{\pi}{60} \right\} \\ \times \left\{ N\left(r, \frac{1}{f}\right) + N(r, f) \right\},$$

and hence, by Jensen's formula,

$$(2.17) \quad 2T(r, f) \geq \left( 1 + \cos \frac{\pi}{60} + \frac{(1 - \eta(r)) \left(1 - \cos \frac{\pi}{4}\right) \varepsilon \sin \frac{\varepsilon}{2}}{4\pi} \right) \\ \times \left\{ N\left(r, \frac{1}{f}\right) + N(r, f) \right\} (f(0) = 1).$$

Using (2.13), it is easy to obtain an explicit numerical bound for the coefficient of  $N(r, 1/f) + N(r, f)$  in (2.17). Since this bound exceeds 2, we obtain (2.14).

In order to see that (2.14) holds if  $f(z)$  is replaced by  $F(z)$ , we observe that

$$(2.18) \quad m(r, e^{S(z)}) \leq T(r, F(z)) + T(r, f(z)) \quad (f(0) = 1).$$

Now

$$(2.19) \quad T(r, f) = o(r^3) \quad (r \rightarrow +\infty),$$

because, by assumption,  $f(z)$  is of genus not greater than 2 [3; p. 235].

If  $S(z)$  is a polynomial of degree not greater than 2, there is nothing to prove since  $F(z)$  is still of genus not greater than 2. In all other cases

$$(2.20) \quad Xr^3 \leq m(r, e^{S(z)}),$$

for some  $X(> 0)$  and  $r$  sufficiently large. Hence we obtain the last assertion of the lemma by combining (2.14), (2.18), (2.19), and (2.20).

### 3. Proof of Theorem 1.

Inequality (5) of Theorem 1 follows readily from Lemma 1 and Jensen's theorem: with  $\gamma = 0$ , (1.4) yields

$$m(r, f) + m\left(r, \frac{1}{f}\right) \geq N\left(r, \frac{1}{f}\right) + N(r, f), \\ 2T(r, f) \geq 2 \left\{ N\left(r, \frac{1}{f}\right) + N(r, f) \right\} \quad (f(0) = 1),$$

which obviously implies (5).

The first part of Theorem 1 is contained in the following Lemma 5 which we now state and prove.

LEMMA 5. *Let  $f(z)$  be meromorphic. Assume that there exists an integer  $q(\geq 1)$  such that*

$$(3.1) \quad \sum_{\mu} \frac{1}{|a_{\mu}|^q} + \sum_{\nu} \frac{1}{|b_{\nu}|^q} = +\infty .$$

$$(3.2) \quad \sum_{\mu} \frac{1}{|a_{\mu}|^{q+1}} + \sum_{\nu} \frac{1}{|b_{\nu}|^{q+1}} < +\infty .$$

*Let  $p$  be an odd integer*

$$(3.3) \quad 1 \leq p \leq q .$$

*Consider the sectors  $\Delta_k$  defined by*

$$(3.4) \quad \left| \arg z - \frac{2\pi k}{p} \right| \leq \frac{\pi}{60q} \quad (k = 0, 1, 2, \dots, p-1).$$

*and the sectors  $\Delta_k^*$  defined by*

$$(3.5) \quad \left| \arg z - \pi - \frac{2\pi k'}{p} \right| \leq \frac{\pi}{60q} \quad (k' = 0, 1, 2, \dots, p-1).$$

*If every zero of  $f(z)$  lies in one of the sectors  $\Delta_k$  and every pole in one of the sectors  $\Delta_k^*$ , then*

$$(3.6) \quad \limsup_{r \rightarrow \infty} \frac{N\left(r, \frac{1}{f}\right) + N(r, f)}{T(r, f)} \leq \frac{1}{1+A} ,$$

*where  $A$  is the absolute constant in Lemma 4.*

*Proof.* Consider the odd integer  $s$  defined by

$$(3.7) \quad s \leq \frac{q}{p} < s+2 ;$$

in view of (3.3)

$$1 \leq s .$$

Put

$$(3.8) \quad l = ps , \quad \omega = \exp\left(\frac{2\pi i}{l}\right) .$$

Clearly  $l$  is a positive odd integer and, by (3.7)

$$(3.9) \quad l \leq q < l + 2p \leq 3l .$$

In view of (3.1) and (3.2), the function  $f(z)$  is of the form

$$f(z) = e^{S(z)} \frac{\Pi E\left(\frac{z}{a_\mu}, q\right)}{\Pi E\left(\frac{z}{b_\nu}, q\right)},$$

where  $S(z)$  is entire.

Consider now the auxiliary function

$$(3.10) \quad G(z) = f(z)f(\omega z) \cdots f(\omega^{l-1}z) = e^{R(z^l)} \frac{\Pi E\left(\frac{z^l}{a_\mu^l}, \left[\frac{q}{l}\right]\right)}{\Pi E\left(\frac{z^l}{b_\nu^l}, \left[\frac{q}{l}\right]\right)},$$

where  $R(z)$  is entire and the genus  $[q/l]$  of the primary factors is, by (3.9), either 1 or 2.

Putting

$$\phi_\mu = \arg a_\mu, \quad \psi_\nu = \arg b_\nu,$$

our inequalities (3.4), (3.5), and (3.7) imply

$$(3.11) \quad |\phi_\mu l - 2\pi ks| \leq \frac{\pi}{60}, \quad |\psi_\nu l - \pi l - 2\pi k's| \leq \frac{\pi}{60}.$$

We also notice that our assumptions prevent the possibility of cancellation between the zeros of one of the functions  $f(\omega^j z)$  ( $j = 0, 1, \dots, l - 1$ ) and the poles of another of these functions. Hence

$$(3.12) \quad N(r, G(z)) = lN(r, f), \quad N\left(r, \frac{1}{G(z)}\right) = lN\left(r, \frac{1}{f}\right).$$

Put

$$H(u) = e^{R(u)} \frac{\Pi E\left(\frac{u}{a_\mu^l}, \left[\frac{q}{l}\right]\right)}{\Pi E\left(\frac{u}{b_\nu^l}, \left[\frac{q}{l}\right]\right)},$$

and rewrite (3.10) as

$$(3.13) \quad G(z) = H(z^l).$$

The inequalities (3.11), the assumption (3.1), and the first of the

inequalities (3.9) show that it is possible to apply Lemma 4 to  $H(u)$  (instead of  $f(z)$ ). Hence

$$(3.14) \quad T(r, H(u)) \cong (1 + A) \left\{ N\left(r, \frac{1}{H(u)}\right) + N(r, H(u)) \right\} \quad (r \cong r_0) .$$

On the other hand, the fundamental definitions of Nevanlinna's theory show that, for any meromorphic function  $w(z)$ :

$$N(r, w(z^l)) = N(r^l, w(z)) , \quad T(r, w(z^l)) = T(r^l, w(z)) ,$$

so that (3.13) and (3.14) yield

$$(3.15) \quad T(r, G(z)) \cong (1 + A) \left\{ N\left(r, \frac{1}{G(z)}\right) + N(r, G(z)) \right\} \quad (r^l \cong r_0) .$$

Since

$$lT(r, f) \cong T(r, G(z)) ,$$

we see that (3.6) follows from (3.12) and (3.15).

We obtain the first part of Theorem 1 by taking  $p = 1$  in Lemma 5.

**4. Proof of the Corollaries.** Corollary 1.1 follows trivially from the inequalities (4) and (5) and the definition of deficiency.

Corollary 1.2 is contained in the following.

**LEMMA 6.** *Let  $f(z)$  be entire. Modify the assumptions of Lemma 5 by:*

- (i) *omitting all reference to poles;*
- (ii) *omitting the restriction that  $p$  be odd ( $p$  may be any integer satisfying the inequality (3.3)).*

*Then (3.6) still holds.*

The proof of Lemma 5 also yields Lemma 6 provided the integer  $s$  (even or odd) is defined by

$$s \cong \frac{q}{p} < s + 1 ,$$

instead of (3.7). The definitions (3.8) remain unchanged and (3.9) takes the sharper form

$$l \cong q < 2l .$$

The other changes in the proof are obvious and need not be mentioned here.

We obtain Corollary 1.2 by taking  $p = 2$ , in Lemma 6.

5. Best possible character of the conditions (2) and (6).

Let

$$(5.1) \quad s_1, s_2, s_3, \dots$$

be a sequence of integers such that

$$(5.2) \quad s_1 \geq 2, \quad s_{\lambda+1} > 2s_\lambda \quad (\lambda = 1, 2, 3, \dots).$$

Consider the entire function

$$f(z) = \prod_{\lambda=1}^{\infty} \prod_{m=s_\lambda}^{2s_\lambda} \left(1 - \frac{z}{m(\log m)^2}\right).$$

Denoting by  $\{a_\mu\}$  the sequence of the zeros of  $f(z)$ , elementary estimates yield

$$(5.3) \quad \sum_{\mu} \frac{1}{a_\mu} < +\infty, \quad \sum_{\mu} \frac{1}{a_\mu^\kappa} = +\infty \quad (\kappa < 1).$$

These relations hold for every choice of the sequence (5.1). Hence we may take the ratios  $s_{\lambda+1}/s_\lambda$  to be rapidly increasing with  $\lambda$  and, using the well-known formula [4; p. 271]:

$$\log M(r, f) = r \int_0^\infty \frac{n\left(t, \frac{1}{f}\right)}{t(t+r)} dt,$$

choose (5.1) so that

$$(5.4) \quad \liminf_{r \rightarrow \infty} \frac{\log T(r, f)}{\log r} \leq \liminf_{r \rightarrow \infty} \frac{\log \log M(r)}{\log r} = 0.$$

It is sufficient to choose the sequence (5.1) in such a way that, for some arbitrarily large  $u$ ,  $n(t, 1/f)$  is constant in  $u \leq t \leq e^u$ .

Hence, putting

$$(5.5) \quad \begin{aligned} F(z) &= \frac{f(z)}{f(-z)}, \\ \liminf_{r \rightarrow \infty} \frac{\log T(r, F(z))}{\log r} &= 0. \end{aligned}$$

It has been shown elsewhere [1; p. 297, Theorem 4] that the condition (5.5) implies

$$\delta(\tau, F(z)) = 0,$$

except possibly for a single value of  $\tau$ , finite or infinite.

Hence the inequalities

$$\delta(0, F(z)) > 0, \quad \delta(\infty, F(z)) > 0,$$

are both impossible since one of them would imply the other one. We thus have

$$1 = \limsup_{r \rightarrow \infty} \frac{N(r, F)}{T(r, F)} = \frac{1}{2} \limsup_{r \rightarrow \infty} \frac{N\left(r, \frac{1}{F}\right) + N(r, F)}{T(r, F)},$$

although  $F(z)$  satisfies all the conditions of Theorem 1 except (2) which is replaced by the weaker condition (5.3).

Similarly, (5.4) and Theorem 4 of [1] yield

$$\delta(\tau, f(z)) = 0 \tag{6.1}$$

and hence, putting

$$F^*(z) = f(z^2)$$

we have

$$\delta(\tau, F^*(z)) = 0 \tag{6.2}$$

In particular  $\delta(0, F^*(z)) = 0$ , although  $F^*(z)$  satisfies all the conditions of Corollary 1.2 except (6) which is replaced by a weaker condition analogous to (5.3).

**6. Proof of Theorem 2.** Our proof is a straightforward consequence of Lemma 6 and of a classical theorem of H. Weyl [5; p. 335, Satz 16].

We consider the arguments  $\omega_j$  of the radii carrying the zeros of  $f(z)$  and assume

$$\omega_0 = 0;$$

this is clearly no restriction.

Let  $k + 1$  ( $0 \leq k \leq m$ ) be the maximum number of linearly independent elements among

$$(6.1) \quad 2\pi, \omega_1, \omega_2, \dots, \omega_m.$$

Renumbering, if necessary, the  $\omega$ 's we may assume:

(i) that a relation such as

$$(6.2) \quad \mu_0 2\pi + \sum_{j=1}^k \mu_j \omega_j = 0,$$

is impossible for integral values of the  $\mu$ 's, not all zero;

(ii) if  $k < m$ , there exist integers  $n_j$ , and  $\sigma (> 0)$  such that

$$(6.3) \quad \sigma\omega_l = 2\pi n_{l0} + \sum_{j=1}^k n_{lj}\omega_j \quad (l = k + 1, \dots, m).$$

Put

$$M_l = \sum_{j=1}^k |n_{lj}|$$

and

$$(6.4) \quad M = \sup \{ \sigma, M_{k+1}, M_{k+2}, \dots, M_m \} .$$

Since no relation such as (6.2) is possible, Weyl's theorem asserts the existence of a sequence

$$(6.5) \quad \lambda_1, \lambda_2, \lambda_3, \dots$$

of increasing integers such that

$$(6.6) \quad | \lambda_s \omega_j - L_{sj} 2\pi | \leq \frac{\pi}{120M} \quad (j = 1, 2, \dots, k; s = 1, 2, 3, \dots),$$

where the  $L_{sj}$  are integers. Weyl's theorem also asserts that the sequence (6.5) has a positive density. The latter property is unnecessarily precise for our purposes; we only need the obvious implication

$$(6.7) \quad \lambda_{s+1} < 2\lambda_s \quad (s \geq s_0).$$

We set

$$K = \sigma\lambda_{s_0}$$

and observe that the integer  $K$  depends only on the  $\omega$ 's.

By the assumptions (9) and (10), there exists an integer  $q$  such that

$$q \geq K, \quad \sum_{\mu} \frac{1}{|a_{\mu}|^q} = +\infty, \quad \sum_{\mu} \frac{1}{|a_{\mu}|^{q+1}} < +\infty.$$

Define  $h$  by the inequalities

$$(6.8) \quad \sigma\lambda_h \leq q < \sigma\lambda_{h+1} .$$

In view of the definition of  $K$  and (6.7)

$$(6.9) \quad q < 2\sigma\lambda_h .$$

We now obtain Theorem 2 by verifying that Lemma 6 may be applied with the value of  $q$  chosen above and

$$(6.10) \quad p = \sigma\lambda_h .$$

It is clear that we only have to ascertain that the zeros of  $f(z)$  lie in regions such as (3.4) with  $p$  defined by (6.10).

Using (6.6) and (6.4) in (6.3), we obtain

$$(6.11) \quad |\sigma\lambda_n\omega_l - A_{nl}2\pi| \leq \frac{\pi}{120} \quad (l = k + 1, k + 2, \dots m),$$

where the  $A$ 's are integers.

By (6.6) and (6.4), it is clear that (6.11) holds also for  $l = 1, 2, \dots k$ , with

$$A_{nl} = \sigma L_{nl} \quad (l = 1, 2, \dots k).$$

Hence, by (6.9), (6.10) and (6.11)

$$\left| \omega_l - \frac{A_{nl}2\pi}{p} \right| \leq \frac{\pi}{60q} \quad (l = 1, 2, \dots m).$$

This shows that the location of zeros allows the application of Lemma 6. Theorem 2 is an immediate consequence.
