ON A CLASS OF MEROMORPHIC FUNCTIONS WITH DEFICIENT ZEROS AND POLES

Simon Hellerstein
ON A CLASS OF MEROMORPHIC FUNCTIONS WITH DEFICIENT ZEROS AND POLES

S. Hellerstein

Introduction. It has been shown by A. Edrei and W.H.J. Fuchs [1], that if $f$ is an entire function all of whose zeros lie on the negative real axis, then $f$ has zero as a Nevanlinna deficient value provided only that the exponent of convergence of the zeros is finite and greater than 1. The extension of this result to more general distributions of the arguments of the zeros and poles of a meromorphic function was investigated independently in [2] and [3].

In [2], Edrei, Fuchs and the present author consider entire functions whose zeros have a finite exponent of convergence and are distributed on a finite number of rays. The main result of that investigation is the following:

THEOREM A. Let $f(z)$ be entire. Assume that all its zeros $\{a_\mu\}$ lie on the radii defined by

$$re^{i\omega_0}, re^{i\omega_1}, \ldots, re^{i\omega_n} \quad (r > 0)$$

where the $\omega$'s are real.

Then there exists a positive constant $K$, depending only on the $\omega$'s and such that the condition

$$\sum_{\mu} \frac{1}{|a_\mu|^\xi} = +\infty$$

and the condition

$$\sum_{\mu} \frac{1}{|a_\mu|^\xi} < +\infty$$

for some finite value of $\xi$, imply

$$\delta(0,f) \geq A > 0$$

where $A(>0)$ is an absolute constant.

In [3], A. A. Goldberg shows that given $\rho$ not an integer, such that $\frac{1}{2} < \rho < +\infty$ and given two arbitrary positive numbers $\alpha$ and $\beta$...
then there exists a meromorphic function $f(z)$ of order $\rho$, all of whose zeros lie on the rays $\text{arg } z = \alpha$ and $\text{arg } z = \alpha + (\pi/\rho)$ and all of whose poles lie on the rays $\text{arg } z = \beta$ and $\text{arg } z = \beta + (\pi/\rho)$ for which $\delta(0,f) = \delta(\infty,f) = 0$.

Hence, any theorem for meromorphic functions analogous to Theorem A must place some restriction on the geometrical configuration of the rays on which the zeros and poles of the function are situated.

The main purpose of this note is to show that the methods of [2] go further and yield the following generalization of Theorem A to meromorphic functions.

**Theorem.** Let $f(z)$ be meromorphic. Let $\{a_\mu\}$ denote the zeros of $f$ which lie on the radii defined by

(i) $re^{i\omega_1}, re^{i\omega_2}, \ldots, re^{i\omega_m}$ $(r > 0)$

and let $\{b_\nu\}$ denote the poles of $f$ which lie on the radii defined by

(ii) $re^{i\psi_1}, re^{i\psi_2}, \ldots, re^{i\psi_n}$ $(r > 0)$.

Assume

(iii) that the real numbers $2\pi, \omega_1, \ldots, \omega_k, \psi_1, \ldots, \psi_n$ $(0 \leq k \leq m)$ are linearly independent over the field of rational numbers and

(iv) $\omega_{k+h} = a_{0,h}2\pi + \sum_{i=1}^{k} a_{i,h}\omega_i$ $(h = 1, 2, \ldots, m - k)$

where $a_{0,h}, a_{1,h}, \ldots, a_{k,h}$ are rational.

Let $\{a^*_\mu\}$ denote the zeros of $f$ which do not lie on the radii defined by (i) and $\{b^*_\nu\}$ the poles of $f$ which do not lie on the radii defined by (ii).

Then, there exists a positive constant $K$ (depending only on the $\omega$'s and $\psi$'s) and an absolute constant $B(>0)$ such that the conditions

\[
\sum_{\mu} \frac{1}{|a_\mu|^k} + \sum_{\nu} \frac{1}{|b_\nu|^k} = +\infty
\]

(1.1)

\[
\sum_{\mu} \frac{1}{|a_\mu|^t} + \sum_{\nu} \frac{1}{|b_\nu|^t} < +\infty
\]

(1.2)

for some finite value of $\xi(>K)$ and

\[
\sum_{\mu} \frac{1}{|a^*_\mu|^p} + \sum_{\nu} \frac{1}{|b^*_\nu|^p} < +\infty
\]

(1.3)

for some $\eta < B$, imply
As an immediate consequence of this theorem and the definition of deficiency, we find

**Corollary.** The assumptions of the theorem imply

\[ \delta(0, f) \geq \frac{A}{1 + A} ; \quad \delta(\infty, f) \geq \frac{A}{1 + A}. \]

We shall show that Lemma 4 of [2] combined with a suitable number theoretical lemma which we state and prove in § 3 are sufficient to yield our theorem.

2. Statement of a known lemma. For the convenience of the reader, we restate Lemma 4 of [2] in a form suitable for use here.

**Lemma A.** Let \( f(z) \) be a meromorphic functions of genus not greater than 2.

Assume

(i) that its zeros \( \{a_\mu\} \) lie in the region defined by

\[ |\arg z| \leq \frac{\pi}{60}, \]

(ii) that its poles \( \{b_\nu\} \) lie in the region defined by

\[ |\arg z - \pi| \leq \frac{\pi}{60}, \]

(iii) \[ \sum_{\mu} \frac{1}{|a_\mu|} + \sum_{\nu} \frac{1}{|b_\nu|} = +\infty. \]

Then, for all sufficiently large values of \( r \),

\[ T(r, f) \geq (1 + A)\left\{ N(r, \frac{1}{f}) + N(r, f) \right\} \]

where \( A(>0) \) is an absolute constant.

The inequality (2.1) still holds if \( f(z) \) is replaced by \( F(z) \):

\[ F(z) = e^{S(z)} f(z) \]

where \( S(z) \) is an entire function (which may reduce to a polynomial).
3. A number theoretical lemma. In order to apply the methods of [2], we also require the following generalization of a number theoretical argument used in the proof of Theorem A [2, §6].

Conventions. Before we proceed with the statement and proof of the lemma, we make the following conventions.

In all that follows, we shall use the terms "linear dependence" and "linear independence" to denote linear dependence and independence over the field of rational numbers.

In addition, given a set $S$ of real numbers we shall use the term "$S^*$ is a maximal linearly independent subset of $S$" to mean the following:

(i) the elements of $S^*$ are linearly independent over the field of rational numbers,

and

(ii) any element of $S$ is a linear combination with rational coefficients of the elements of $S^*$.

**Lemma 1.** Let $S_1$ be the set of real numbers

$$2\pi, \omega_1, \omega_2, \cdots, \omega_m$$

and $S_2$ the set consisting of the real numbers

$$\psi_1, \psi_2, \cdots, \psi_n.$$

Assume

(i) that the set of real numbers $2\pi, \omega_1, \cdots, \omega_k, (0 \leq k \leq m)$ is a maximal linearly independent subset of $S_1$,

(ii) that the real numbers

$$2\pi, \omega_1, \omega_2, \cdots, \omega_k, \psi_1, \psi_2, \cdots, \psi_n$$

are linearly independent.

Then

given $\varepsilon(>0)$ there exists an increasing sequence of positive integers

$\{L_s\}_{s=1}^{\infty}$ and sequences of positive integers $\{M_{s,i}\}_{i=1}^{\infty}, \{N_{s,j}\}_{j=1}^{\infty}$ $(i = 1, 2, \cdots, m)$;

$\{N_{s,j}\}_{j=1}^{\infty}$ $(j = 1, 2, \cdots, n)$; such that for $s = 1, 2, 3, \cdots$

\begin{align*}
(3.1) & \quad |L_s\omega_i - 2\pi M_{s,i}| < \varepsilon, \quad (i = 1, 2, \cdots, m), \\
(3.2) & \quad |L_s\psi_j - (2N_{s,j} + 1)\pi| < \varepsilon, \quad (j = 1, 2, \cdots, n), \\
(3.3) & \quad \frac{L_{s+1}}{L_s} \leq 2.
\end{align*}

and all $s \geq s_0$.
Proof. We assume $k < m$ and prove the lemma for this case only. If $k = m$, it will be clear that one part of our argument yields the desired result.

By assumption (i), $\omega_{k+h}$ ($h = 1, 2, \ldots, m - k$) is a linear combination with rational coefficients of $2\pi, \omega_1, \omega_2, \ldots, \omega_k$. Hence, there exist a positive integer $T$ and integers $A_{h,i}$, $(h = 1, 2, \ldots, m - k)$, $(i = 0, 1, \ldots, k)$, such that

\begin{equation}
T\omega_{k+h} = 2\pi A_{h,0} + \sum_{i=1}^{k} A_{h,i} \omega_i \quad (h = 1, 2, \ldots, m - k).
\end{equation}

Set

\begin{equation}
\widetilde{A}_h = \sum_{i=1}^{k} |A_{h,i}| \quad (h = 1, 2, \ldots, m - k),
\end{equation}

\begin{equation}
Q = \max \{T, \widetilde{A}_1, \widetilde{A}_2, \ldots, \widetilde{A}_{m-k}\}
\end{equation}

and

\begin{equation}
T = 2^l (2J + 1)
\end{equation}

where $I$ and $J$ are nonnegative integers.

Assumption (ii) of our lemma and the equidistribution theorem of H. Weyl [4] imply that there exists a positive increasing sequence of integers $\{B_s\}_{s=1}^\infty$, and sequences of integers $\{C_{s,i}\}_{s=1}^\infty$ $(i = 1, 2, \ldots, k)$, and $\{D_{s,j}\}_{s=1}^\infty$ $(j = 1, 2, \ldots, n)$, such that for each $s = 1, 2, \ldots$

\begin{equation}
|B_s \psi_i - 2\pi C_{s,i}| < \frac{\varepsilon}{Q} \quad (i = 1, 2, \ldots, k),
\end{equation}

\begin{equation}
|B_s \psi_j - 2\pi D_{s,j} - \frac{\pi}{2^I}| < \frac{\varepsilon}{T} \quad (j = 1, 2, \ldots, n),
\end{equation}

and $\{B_s\}_{s=1}^\infty$ has a positive density; that is

\begin{equation}
\lim_{s \to \infty} \frac{s}{B_s} = d > 0.
\end{equation}

From (3.8) and (3.7) we have for each $s = 1, 2, 3, \ldots$

\begin{equation}
|B_s T \omega_i - 2\pi T C_{s,i}| < \frac{\varepsilon T}{Q} \leq \varepsilon.
\end{equation}

From (3.4), (3.8), (3.5), and (3.6), we deduce that for $s = 1, 2, 3, \ldots$

\begin{equation}
|B_s T \omega_{k+h} - 2\pi B_s A_{h,0} - 2\pi \sum_{i=1}^{k} A_{h,i} C_{s,i}| \leq \left[ \max_{i=1,2,\ldots,k} \{|B_s \omega_i - 2\pi C_{s,i}|\} \right] \cdot \sum_{i=1}^{k} |A_{h,i}| \leq \frac{\varepsilon}{Q} \cdot Q = \varepsilon \quad (h = 1, 2, 3, \ldots, m - k).}
\end{equation}
Furthermore, (3.7) and (3.9) imply that for each $s = 1, 2, 3, \ldots$

\begin{equation}
|B_s T \psi_j - 2\pi T D_{s,j} - \pi (2J + 1)| < \varepsilon .
\end{equation}

We now show that for $s \geq s_0$,

\begin{equation}
\frac{B_{s+1}}{B_s} \leq 2 .
\end{equation}

If this were not so, we would have for infinitely many values of $s$:

\begin{align*}
\frac{1}{2} \cdot \frac{1}{B_s} > \frac{1}{B_{s+1}} , \\
\frac{1}{2} \cdot \frac{s}{B_s} > \frac{s + 1}{B_{s+1}} \cdot \frac{s}{s + 1} ,
\end{align*}

and by (3.10)

\begin{equation}
\frac{1}{4} d \geq d ,
\end{equation}

which is impossible.

We set $L_s = B_s T$. The inequalities (3.11), (3.12), (3.13) and (3.14) show that the sequence $\{L_s\}_{s=1}^\infty$ satisfies all the assertions of our lemma (with an obvious choice of the corresponding sequences $\{M_{s,i}\}$, and $\{N_{s,j}\}$).

4. Proof of the theorem. From the hypotheses of our theorem, it follows that if we set $\varepsilon = \pi/60$ in Lemma 1, there exist sequences $\{L_s\}_{s=1}^\infty$, $\{M_{s,i}\}_{s=1}^\infty$, $(i = 1, 2, \ldots, m)$, $\{N_{s,j}\}_{s=1}^\infty$, $(j = 1, 2, \ldots, n)$ such that (3.1), (3.2) and (3.3) hold with $\varepsilon = \pi/60$. Now choose $K = L_{s_0}$ and note that $L_{s_0}$ depends only on the $\omega$’s and $\psi$’s. Since the zeros $\{a_\mu\}$ and poles $\{b_\nu\}$ of $f$ satisfy conditions (1.1) and (1.2), it follows that there exists an integer $q \geq K$ such that

\begin{equation}
\sum_\mu \frac{1}{|a_\mu|^q} + \sum_\nu \frac{1}{|b_\nu|^q} = +\infty
\end{equation}

and

\begin{equation}
\sum_\mu \frac{1}{|a_\mu|^{q+1}} + \sum_\nu \frac{1}{|b_\nu|^{q+1}} < +\infty .
\end{equation}

Define $h$ by the inequalities

\begin{equation}
L_h \leq q < L_{h+1} .
\end{equation}

Clearly

\begin{equation}
h \geq K = L_{s_0} ,
\end{equation}

and in view of (3.3)
Consider the auxiliary function

\[(4.4) \quad \hat{f}(z) = e^{\xi(z)} \frac{\pi_1(z)}{\pi_2(z)}\]

where \(S(z)\) is an arbitrary entire function,

\[(4.5) \quad \pi_1(z) = \prod_\mu \left(1 - \frac{z}{a_\mu}\right) \exp\left(\frac{z}{a_\mu} + \frac{z^2}{2a_\mu^2} + \cdots + \frac{z^q}{qa_\mu^q}\right)\]

and

\[(4.6) \quad \pi_2(z) = \prod_\nu \left(1 - \frac{z}{b_\nu}\right) \exp\left(\frac{z}{b_\nu} + \frac{z^2}{2b_\nu^2} + \cdots + \frac{z^q}{qb_\nu^q}\right);\]

where in view of (4.1) and (4.2), at least one of the two products (4.5) and (4.6) is canonical.

We show next that (4.4) holds for a function of the form \(\hat{f}\), and finally that this implies the validity of (4.4) for \(f\).

Put \(L_h = L\) and consider the function

\[(4.7) \quad F(z) = \hat{f}(z) \hat{f}(\omega z) \cdots \hat{f}(\omega^{e-1} z)\]

where \(\omega = e^{(2\pi i)/L}\).

It is an easy consequence of the relations (4.4)-(4.7) that

\[(4.8) \quad F(z) = G(z^L) = e^{R(z^L)} g(z^L) = e^{R(z^L)} \frac{\prod_\mu \left(1 - \frac{z^L}{a_\mu^L}\right) \exp\left(\frac{z^L}{a_\mu^L}\right)}{\prod_\nu \left(1 - \frac{z^L}{b_\nu^L}\right) \exp\left(\frac{z^L}{b_\nu^L}\right)}\]

where \(R\) is entire and \(g\) is a meromorphic function of genus not greater than one. In fact, our assumptions imply that the genus of \(g\) is actually one. In order to see this we observe first that for all \(\mu\) and \(\nu\)

\[a_\mu^L \neq b_\nu^L.\]

For, if this were not so, we would have for some \(\mu\) and \(\nu\)

\[a_\mu^L = b_\nu^L,\]

\[|a_\mu|^L e^{i\omega_j} = |b_\nu|^L e^{i\psi_k}.\]

Hence, for some integer \(N\)

\[L \psi_k = L \omega_j + 2N\pi,\]

which, in view of conditions (iii) and (iv) of the theorem, is impossible.
Therefore, cancellation of zeros and poles of \( g \) cannot occur. It follows then from (4.1), (4.2) and the inequality \( L \leq q < 2L \), that the genus of \( g \) is indeed one.

Setting \( z^L = \zeta \)

\[
G(\zeta) = e^{R(\zeta)} \prod_{\mu} \frac{1 - \frac{\zeta}{a^\mu}}{a^\mu} \exp \left( \frac{\zeta}{a^\mu} \right) \prod_{\nu} \frac{1 - \frac{\zeta}{b^\nu}}{b^\nu} \exp \left( \frac{\zeta}{b^\nu} \right).
\]

But \( L = L_0 \) was so chosen that there exist positive integers \( M_i \) (\( i = 1, 2, \ldots, m \)) and \( N_j \) (\( j = 1, 2, \ldots, n \)) so that

\[
|L\omega_i - 2\pi M_i| < \frac{\pi}{60} \quad (i = 1, 2, \ldots, m)
\]

and

\[
|L\psi_j - (2N_j + 1)\pi| < \frac{\pi}{60} \quad (j = 1, 2, \ldots, n).
\]

Hence \( G(\zeta) \) is a meromorphic function satisfying the hypotheses of Lemma A, and consequently

\[
T(r, G(\zeta)) \geq (1 + A) \left\{ N \left( r, \frac{1}{G(\zeta)} \right) + N(r, G(\zeta)) \right\} \quad (r \geq r_0).
\]

We observe now, that the fundamental definitions of the theory imply [2, p. 147] that for any meromorphic function \( W(z) \)

\[
N(r, W(z^L)) = N(r^L, W(z))
\]

and

\[
T(r, W(z^L)) = T(r^L, W(z)).
\]

Since \( G(\zeta) = G(z^L) = F(z) \), we deduce from (4.12), (4.13) and (4.14) that

\[
T(r, F(z)) \geq (1 + A) \left\{ N \left( r, \frac{1}{F(z)} \right) + N(r, F(z)) \right\} \quad (r \geq r_0).
\]

Now, the definition of \( \omega \), conditions (i)–(iv) of the hypothesis and the definitions (4.4)–(4.6) prevent the possibility of cancellation between the zeros of one of the functions \( \tilde{f}(\omega^j z) \) (\( j = 0, 1, 2, \ldots, L - 1 \)) and the poles of another of these functions.

Hence, by (4.7) and the basic definitions of Nevanlinna’s theory, it follows that

\[
N(r, F(z)) = LN(r, \tilde{f}(z)),
\]
From (4.15), (4.16), (4.17) and (4.18) we readily deduce

\[ T(r, \hat{f}(z)) \geq (1 + A) \left\{ N(r, \frac{1}{\hat{f}(z)}) + N(r, \hat{f}(z)) \right\} . \]

The inequality (4.19) together with the definition of deficiency imply

\[ \delta(0, \hat{f}) \geq \frac{A}{1 + A}, \quad \delta(\infty, \hat{f}) \geq \frac{A}{1 + A}. \]

Hence, by Theorem 4 of [1], it follows that the lower order \( \lambda \) of \( f(z) \) satisfies

\[ \lambda \geq \frac{\log \left[ 1 + \frac{A^2}{1 + 2A} \right]}{\log \left[ 1 + \frac{4(1 + A)^2}{A} \right]} = B > 0. \]

Since \( A(>0) \) is an absolute constant, the same is true of \( B \).

We now return to \( f(z) \). Assume that (1.3) holds for some \( \eta < B \); \( B \) defined by (4.21).

Then, in view of the assumptions of the theorem, we may represent \( f(z) \) in the form

\[ f(z) = h(z) \hat{f}_0(z) \]

where \( h(z) \) is a meromorphic function of order less than \( B \) and \( \hat{f}_0(z) \) is defined by (4.4) with a suitable choice of \( S(z) \), (4.5) and (4.6). Hence it follows that (4.19) holds with \( f \) replaced by \( \hat{f}_0 \); moreover, the lower order of \( \hat{f}_0 \) exceeds the order of \( h \).

Then, by elementary inequalities of Nevanlinna’s theory

\[ T(r, \hat{f}_0) \sim T(r, \hat{f}) , \]

\[ \frac{N(r, \hat{f}_0)}{T(r, \hat{f}_0)} = \frac{N(r, \hat{f})}{T(r, \hat{f})} + o(1) \]

and

\[ \frac{N\left( r, \frac{1}{\hat{f}_0} \right)}{T(r, \hat{f}_0)} = \frac{N\left( r, \frac{1}{\hat{f}} \right)}{T(r, \hat{f})} + o(1). \]
The inequality (1.4) is now an immediate consequence of (4.19) applied to $f_0(z)$, together with the relations (4.22), (4.23) and (4.24).
