SOLUTION OF LOOP EQUATIONS BY ADJUNCTION

RAFAEL ARTZY

SOLUTION OF LOOP EQUATIONS BY ADJUNCTION

R. ARTZY

Solutions of integral equations over groups by means of adjunction of new elements have been studied by B. H. Neumann [3] and F. Levin [2]. Here an analogous question for loops will be dealt with, and the results will prove to be useful also for groups.

Let (L, \cdot) be a loop with neutral element e , x an indeterminate. Let w be a word whose letters are x and elements of L . Let n be the number of times that x appears in w . Form $f(x)$ from w by inserting parentheses between its letters so as to make it into a uniquely defined expression if juxtaposition means loop multiplication. The equation $f(x)=r$, r in L , will be called an *integral loop equation in x of degree n* .

An integral loop equation $f(x) = r$ is *monic* if $f(x)$ is a product of two factors both containing x . Every integral loop equation can be made monic by a finite number of left or right divisions by elements of L .

Not every integral loop equation has a solution as indicated by the monic example $x^2 = r$, $r \neq e$, L the four-group. Our aim is finding a loop E in which L is embedded and in which $f(x) = r$ has a solution. The loop E used here will be an extension loop [1] of L by $(C_n, +)$, the cyclic group of order n . The construction follows the

Extension Rule. The elements of E are ordered couples (c, a) where $c \in C_n$, $a \in L$. Equality of couples is componentwise. The multiplication in E is defined by $(c_1, a_1)(c_2, a_2) = (c_1 + c_2, a_1 a_2 \cdot h(c_1, c_2))$, where $h(c_1, c_2)$ is an element of L depending on c_1 and c_2 , assuming the value e except in the case when $c_1 + c_2 = 0$ and $c_1 \neq 0$.

THEOREM 1. *A monic integral loop equation $f(x) = r$ of degree n over a loop L has a solution in an extension loop $E = (C_n, L)$ constructed according to the Extension Rule, with $f(e)h(c, n - c) = r$ whenever $c \neq 0$.*

Proof. If the element b of L is represented in E by $(0, b)$, L is mapped isomorphically into E . Let x be represented in E by $(1, e)$, where 1 is a generator of C_n . All elements of C_n will be written as integers. Then $f(x)$ can be constructed by stages. For every x entering into the successive multiplication one summand 1 appears in the first component. In the second component only the loop elements of $f(x)$ will appear as factors because x has the second component e . The h 's

do not enter the picture until the last step because they depend on the first components, and all multiplications but the last yield $h(c_1, c_2) = e$ in view of $0 \leq c_1 + c_2 < n$. Thus, at first, the construction of the second component of $f(x)$ in E follows exactly the pattern of the successive multiplication which yielded $f(x)$, with the exception of the factor x . The result is, therefore, the same as though x had been replaced by e , namely $f(e)$. However, the last product, one of whose factors contains by definition at least one x , requires a factor $h(c, n-c)$, $0 < c < n$. Thus the final result is $(n, f(e)h(c, n-c)) = (0, r)$ and consequently $f(e)h(c, n-c) = r$, $c \neq 0$.

THEOREM 2. *An integral loop equation of degree n has in E at least $\varphi(n)$ solutions, φ being Euler's function. For each two of these solutions, x and y , there exists an automorphism of E carrying x into y and leaving L unchanged elementwise.*

Proof. Let again $x = (1, e)$. If k and n are relatively prime, (k, e) is another solution because $nk = 0$ and $h(m, q) = h(km, kq)$ since $m = 0$ or $\neq 0$ according to $km = 0$ or $\neq 0$. There are $\varphi(n)$ distinct k 's with the properties $0 < k < n$ and $(k, n) = 1$. This proves the first part of the theorem. Now, $1 \rightarrow k$ is an automorphism of C_n preserving the 0-element and hence also the h 's. The loop L is unaffected by these automorphisms, because they act only on the first components.

DEFINITION. An *abelian integral identity* over a loop L is an equation $u(w) = v(w')$, where (i) w and w' are words using the same set of elements of L , but not necessarily in the same order, (ii) $u(w)$ and $v(w')$ are formed from w and w' , respectively, by inserting parentheses between the letters of the words so as to make them into uniquely defined expressions if juxtaposition means loop multiplication, (iii) the equality is preserved when the loop elements forming w and w' are replaced by arbitrary elements of L .

In general the validity of abelian integral identities in L , like associativity or the Moufang property, does not carry over into E . However, in the case of degree 2 we are able to obtain the following result.

THEOREM 3. *Let an integral equation of degree 2 over a loop L have the monic form $f(x) = r$. Every abelian integral identity valid in L will hold also in the extension loop E , constructed as in Theorem 1, provided $h(1, 1) = [f(e)]r$ lies in the center of L .*

Proof. The first component of the elements of E is 1 or 0. Moreover, $h(0, 1) = h(1, 0) = h(0, 0) = 1$; write $h(1, 1) = h$, for short. We have

then $h(p, q) = h^{pq}$, where pq is the product of p and q in $GF(2)$, and $h^0 = e, h^1 = h$. The addition in $C_2 = \{0, 1\}$ is the addition of $GF(2)$. The loop elements h^0 and h^1 multiply according to the rule $h^p h^q = h^{p+q}$, and, by the hypothesis of the theorem, they lie in the center of L .

Now, the abelian integral identity $u(w) = v(w')$ in E would surely be satisfied for the first components since they behave as elements of C_2 , an abelian group. If in the second components the h 's are disregarded, the abelian integral identity over E yields an exact replica of the same identity over L . But, as center elements of L , the h 's appearing in u and v can indeed be pulled out and shifted to the right of each side. We denote the product of the h 's of u by $h^{H(u)}$. In the degenerate case where u consists of one letter only, we define $H(u) = 0$. We have to prove for the second components that $u(w)h^{H(u)} = v(w')h^{H(v)}$. Since $u(w) = v(w')$ it will be sufficient to prove $H(u) = H(v)$.

Let the first components of the elements of w be p_1, \dots, p_m . We claim now that $H(u) = \sum_{i,j=1, i < j}^m p_i p_j$, independent of the order of the p 's, and that therefore $H(u) = H(v)$. For $m = 2$ we have trivially $H(u) = p_1 p_2$. For $m = 3, h^{H(u)} = h^{p_1 p_2} h^{(p_1 + p_2) p_3} = h^{p_1 p_2 + p_1 p_3 + p_2 p_3}$. Suppose $H(u) = \sum_{i,j=1, i < j}^{m'} p_i p_j$ has been proved for every word length $m' < m$. If the last multiplication of $u(w)$ is $u'u''$, where u' is a product of p_1, \dots, p_k and u'' of p_{k+1}, \dots, p_m , then the induction hypothesis yields $H(u') = \sum_{i,j=1, i < j}^k p_i p_j$ and $H(u'') = \sum_{i,j=k+1, i < j}^m p_i p_j$. Then

$$\begin{aligned} H(u) &= H(u') + H(u'') + (p_1 + \dots + p_k)(p_{k+1} + \dots + p_m) \\ &= \sum_{i,j=1, i < j}^k p_i p_j + \sum_{i,j=k+1, i < j}^m p_i p_j \\ &\quad + (p_1 + \dots + p_k)(p_{k+1} + \dots + p_m) = \sum_{i,j=1, i < j}^m p_i p_j . \end{aligned}$$

This completes the proof.

COROLLARY. *The equation $xax = r$ over a group G has a solution in an extension group $E = (C_2, G)$ constructed as in Theorem 1, provided $a^{-1}r$ lies in the center of G . In particular the equation has always a solution in E if G is abelian.*

Mathematical papers intended for publication in the *Pacific Journal of Mathematics* should be typewritten (double spaced), and the author should keep a complete copy. Manuscripts may be sent to any one of the four editors. All other communications to the editors should be addressed to the managing editor, L. J. Paige at the University of California, Los Angeles 24, California.

50 reprints per author of each article are furnished free of charge; additional copies may be obtained at cost in multiples of 50.

The *Pacific Journal of Mathematics* is published quarterly, in March, June, September, and December. Effective with Volume 13 the price per volume (4 numbers) is \$18.00; single issues, \$5.00. Special price for current issues to individual faculty members of supporting institutions and to individual members of the American Mathematical Society: \$8.00 per volume; single issues \$2.50. Back numbers are available.

Subscriptions, orders for back numbers, and changes of address should be sent to Pacific Journal of Mathematics, 103 Highland Boulevard, Berkeley 8, California.
