THE INVERSE OF THE ERROR FUNCTION

L. CARLITZ
THE INVERSE OF THE ERROR FUNCTION

L. CARLITZ

1. Introduction. In a recent paper [3] J. R. Philip has discussed some properties of the function invercf θ defined by means of

(1.1) \[ \theta = \text{erfc} \left( \text{inverfc} \, \theta \right). \]

Since

(1.2) \[ \frac{1}{2} \pi^{1/2} (1 - \text{erfc} \, x) = x - \frac{x^3}{3} + \frac{x^5}{2! \cdot 5} - \frac{x^7}{3! \cdot 7} + \frac{x^9}{4! \cdot 9} \cdots \]

it follows that

(1.3) \[ \text{inverfc} \, \theta = u + \frac{1}{3} u^3 + \frac{7}{30} u^5 + \frac{127}{630} u^7 + \frac{4369}{22680} u^9 + \cdots, \]

where

\[ u = \frac{1}{2} \pi^{1/2} (1 - \theta). \]

The coefficients in (1.3) are rational numbers. It is therefore of some interest to look for arithmetic properties of these numbers.

It will be convenient to change the notation slightly. Put

(1.4) \[ f(x) = \int_{0}^{1 - x^{1/2}} dt, \]

so that

\[ f(x) = \left( \frac{\pi}{2} \right)^{1/2} (1 - \text{erfc} \, 2^{1/2} x) \]

and let g(x) denote the inverse function:

(1.5) \[ f(g(u)) = g(f(u)) = u, \]

where

(1.6) \[ g(u) = \sum_{n=0}^{\infty} A_{2n+1} \frac{u^{2n+1}}{(2n + 1)!}, \quad (A_1 = 1). \]

It follows from (1.4) and (1.5) that

(1.7) \[ g'(u) = \exp \left( \frac{1}{2} g^2(u) \right). \]

Differentiating again, we get
\begin{equation}
(1.8) \quad g''(u) = g(u)(g'(u))^2.
\end{equation}

It follows from (1.6) and (1.8) that

\begin{equation}
(1.9) \quad A_{2n+3} = \sum_{r+s=2n+1} \frac{(2n+1)!}{(2r)!(2s)!(2m-2r-2s+1)!} A_{2r+1} A_{2s+1} A_{2m-2r-2s+1}.
\end{equation}

Since $A_1 = 1$ it is evident from (1.9) that all the coefficients $A_{2n+1}$ are positive integers. It is easily verified that the first few values of $A_{2n+1}$ are

\[
A_1 = A_3 = 1, \quad A_5 = 7, \quad A_7 = 127, \quad A_9 = 4369 = 17.257.
\]

We shall show that

\begin{equation}
(1.10) \quad A_{2n+2} \equiv -2.4.6 \cdots (p-1)A_{2n+1} \quad \text{(mod $p$)} ,
\end{equation}

where $p$ is an arbitrary prime and that

\begin{equation}
(1.11) \quad A_{2n+5} \equiv -A_{2n+1} \quad \text{(mod 8)}
\end{equation}

and indeed

\begin{equation}
(1.12) \quad A_{2n+9} \equiv A_{2n+1} \quad \text{(mod 16)} .
\end{equation}

We also find certain congruences (mod $p$) for a sequence of integers $e_{2n}$ related to the $A_{2n+1}$ (see Theorems 2 and 3 below).

Finally we put

\[
\frac{u}{g(u)} = \sum_{n=0}^{\infty} \beta_{2n} \frac{u^{2n}}{(2n)!}
\]

and obtain a theorem of the Staudt-Clausen type for the $\beta_{2n}$, namely

\[
\beta_{2n} = G_{2n} - \frac{b}{3} - \sum_{p \equiv 1 \text{ or } 1 \text{ (mod 3)}} \frac{1}{p} A_{2n/(p-1)}^{p/(p-1)},
\]

where $G_{2n}$ is an integer, $b = 2$ or 1 according as $n \equiv 1$ or $\equiv 1$ (mod 3) and the summation is over all primes $p > 3$ such that $p - 1/2n$. Moreover

\[
A_p \equiv -2.4.6 \cdots (p-1) \quad \text{(mod $p$)} .
\]

2. A series of the form [2]

\begin{equation}
(2.1) \quad H(x) = \sum_{n=0}^{\infty} a_n \frac{x^n}{n!},
\end{equation}

where the $a_n$ are rational integers, is called a Hurwitz series, or briefly an $H$-series. It is easily verified that sum, difference and product of two $H$-series is again an $H$-series. Also the derivative
and the definite integral of the \( H \)-series define by (2.1):

\[
H'(x) = \sum_{n=0}^{\infty} \frac{a_{n+1}}{n!} x^n, \quad \int_0^x H(t) dt = \sum_{n=1}^{\infty} \frac{a_{n-1}}{n!} x^n
\]

are \( H \)-series. If \( H_i(x) \) denotes an \( H \)-series without constant term then \( H_i(x)/k! \) is an \( H \)-series for \( k = 1, 2, 3, \ldots \); it follows that \( H(H_i(x)) \) is an \( H \)-series, where \( H(x) \) is an arbitrary series of the form (2.1).

By the statement

\[
\sum_{n=0}^{\infty} a_n \frac{x^n}{n!} \equiv \sum_{n=0}^{\infty} b_n \frac{x^n}{n!} \quad (\text{mod } m),
\]

where the \( a_n, b_n \) are integers, is meant the system of congruences

\[
a_n \equiv b_n \pmod{m} \quad (n = 0, 1, 2, \ldots).
\]

Thus the above statement about \( H_i(x)/k! \) can be written in the form

\[
(2.2) \quad H_i(x) \equiv 0 \pmod{k!}.
\]

Returning to (1.4) it is evident that

\[
(2.3) \quad f(x) = \sum_{n=0}^{\infty} \frac{(-1)^n x^{2n+1}}{2^n(2n+1)n!} = \sum_{n=0}^{\infty} c_{2n+1} \frac{x^{2n+1}}{(2n+1)!},
\]

where

\[
(2.4) \quad c_{2n+1} = (-1)^n \frac{(2n)!}{2^n n!} = (-1)^n 1 \cdot 3 \cdot 5 \cdots (2n - 1),
\]

so that \( f(x) \) is an \( H \)-series without constant term.

If \( p \) is an odd prime, it follows from (2.4) that

\[
(2.5) \quad c_{2n+1} = 0, \quad (\text{mod } p) \quad (2n + 1 > p).
\]

Thus (1.5) implies

\[
(2.6) \quad \sum_{n=0}^{\frac{p-1}{2}} c_{2n+1} \frac{g^{2n+1}(u)}{(2n+1)!} \equiv u \pmod{p}.
\]

We now compute the coefficient of \( u^p/p! \) in the left member of (2.6). Clearly the terms with \( 1 \leq n < (p - 1)/2 \) contribute nothing. Hence (2.6) yields

\[
A_p + c_p = 0 \pmod{p}.
\]

Using (2.4) this becomes

\[
(2.7) \quad A_p = -(-1)^n 1 \cdot 3 \cdot 5 \cdots (p - 2) \pmod{p},
\]
or if we prefer

\[(2.8) \quad A_p \equiv -2 \cdot 4 \cdot 6 \cdots 2m \equiv -\left(\frac{2}{p}\right)m! \pmod{p},\]

where \(p = 2m + 1\) and \((2/p)\) is the Legendre symbol. For example we have

\[
A_5 \equiv -1 \cdot 3 \equiv 2 \pmod{5}, \\
A_7 \equiv 1 \cdot 3 \cdot 5 \equiv 1 \pmod{7}, \\
A_{11} \equiv 1 \cdot 3 \cdot 5 \cdot 7 \cdot 9 \equiv -1 \pmod{11}.
\]

We consider next the residue \(\pmod{p}\) of \(A_{p+2n}\). If \(2n < p\) we have

\[
\frac{(p + 2n)!}{(2r)! (2s)! (p + 2n - 2r - 2s)!} \equiv \frac{(2n)!}{(2r)! (2s)! (2n - 2r - 2s)!} (\pmod{p})
\]

by a familiar property of multinomial coefficients. Thus (1.9) implies (for \(2n < p\))

\[(2.9) \quad A_{p+2n+2} \equiv \sum_{r+s=2n} \frac{(2n)!}{(2r)! (2s)! (2n - 2r - 2s)!} \cdot A_{2n+1} A_{2n+3} A_{2n+5} (\pmod{p}) \]

Since \(A_p \not\equiv 0 \pmod{p}\) we may put

\[(2.10) \quad A_{p+2n} \equiv A_p e_{2n} \pmod{p} \quad (2n \leq p + 1).\]

Then (2.9) becomes

\[(2.11) \quad e_{2n+2} \equiv \sum_{r+s=2n} \frac{(2n)!}{(2r)! (2s)! (2n - 2r - 2s)!} \cdot A_{2n+1} A_{2n+3} A_{2n+5} e_{2n-3r-2s} (\pmod{p}) \]

provided \(2n < p\).

We now define a set of positive integers \(e_{2n}\) by means of \(e_0 = 1\),

\[(2.12) \quad e_{2n+2} = \sum_{r+s=2n} \frac{(2n)!}{(2r)! (2s)! (2n - 2r - 2s)!} A_{2n+1} A_{2n+3} A_{2n+5} e_{2n-3r-2s} (n = 0, 1, 2, \ldots).
\]

If we put

\[
\phi(x) = \sum_{n=0}^{\infty} e_{2n} \frac{x^{2n}}{(2n)!},
\]

then (2.12) is equivalent to

\[(2.13) \quad \phi''(x) = \phi(x)(g'(x))^2.
\]
Comparing (2.13) with (1.8) we get

\begin{equation}
\frac{\phi''(x)}{\phi(x)} = \frac{g''(x)}{g(x)}.
\end{equation}

It follows that

\[
\phi(x)g'(x) - g(x)\phi'(x) = 1.
\]

A little manipulation yields

\[
\phi(x) = -g(x)\int \frac{dx}{g^2(x)} = -g(x) \int \frac{g'(x) \exp\left(-\frac{1}{2}g^2(x)\right)dx}{g^2(x)}
\]

and we get

\begin{equation}
\phi(x) = 1 - \sum_{n=1}^{\infty} \frac{(-1)^n}{2^n n!} \frac{g^n(x)}{2n - 1}.
\end{equation}

Since

\[
\frac{(2n)!}{2^n(2n - 1)n!} = 1,3,5,\ldots,(2n - 3),
\]

it follows from (2.2) and (2.15) that

\begin{equation}
\phi(x) \equiv 1 - \sum_{n=1}^{\infty} \frac{(-1)^n}{2^n n!} \frac{g^n(x)}{2n - 1} \pmod{p},
\end{equation}

where \( p = 2m + 1 \).

We notice also that (1.7) gives

\begin{equation}
g'(u) \equiv \sum_{n=0}^{\infty} \frac{g^n(u)}{2^n n!} \pmod{p},
\end{equation}

while (1.8) yields

\begin{equation}
g''(u) \equiv \sum_{n=0}^{n-1} \frac{g^{2n+1}(u)}{n!} \pmod{p}.
\end{equation}

3. We may rewrite (1.8) as

\begin{equation}
g''(u) = g(u) \exp g^2(u).
\end{equation}

Differentiating again and using (1.7) we get

\begin{equation}
g'''(u) = (1 + 2g^2(u)) \exp \left(\frac{3}{2}g^2(u)\right).
\end{equation}

Since
it is clear that (3.2) implies
\[ g'''(u) = 1 + 2g'(u) \pmod{3} . \]
On the other hand (1.7) gives
\[ g'(u) = 1 + \frac{1}{2}g''(u) = 1 + 2g'(u) \pmod{3} . \]
We have therefore
\[ (3.3) \quad g'''(u) \equiv g'(u) \pmod{3} . \]
Comparison with (1.6) yields
\[ (3.4) \quad A_{2n+1} \equiv 1 \pmod{3} \quad (n = 0, 1, 2, \ldots) . \]

If we differentiate (3.2) two more times we get
\[ (3.5) \begin{align*}
D^2g(u) &= (7g(u) + 6g^2) \exp(2g'(u)) , \\
D^3g(u) &= (7 + 46g^2(u) + 24g'(u)) \exp(\frac{5}{2}g^2(u)) ,
\end{align*} \]
where \( D = d/du \). From the last equation it follows easily that
\[ D^3g(u) \equiv 2 + g'(u) + 4g'(u) \pmod{5} . \]
Since by (1.7)
\[ Dg(u) \equiv 1 + \frac{1}{2}g''(u) + \frac{1}{8}g'(u) \equiv 1 + 3g''(u) + 2g'(u) \pmod{5} , \]
it follows that
\[ (3.5) \quad (D^3 - 2D)g(u) \equiv 0 \pmod{5} . \]
This is equivalent to
\[ (3.6) \quad A_{2n+5} \equiv 2A_{2n+1} \pmod{5} \quad (n = 0, 1, 2, \ldots) . \]
Since \( A_1 = A_3 = 1 \), (2.6) implies
\[ (3.7) \quad A_{4n+1} \equiv A_{4n+3} \equiv 2^n \pmod{5} \quad (n = 0, 1, 2, \ldots) . \]

It is clear from (3.1), (3.2) and (3.5) that
\[ (3.8) \quad D^n g(u) = \psi_{n-1}(g(u)) \exp\left(\frac{n}{2} g^2(u)\right) , \]
where \( \psi_n(z) \) is a polynomial of degree \( n \) in \( z \) with positive integral coefficients. Differentiating (3.8) we find that \( \psi_n(z) \) satisfies the
The writer has proved [1, §6] that if $i_n$ is an $H$-series without constant term, if $i_n$ is the inverse of $g(x)$ and in addition

\begin{equation}
\tag{3.10}
b_n \equiv 0 \pmod{p} \quad (n > p),
\end{equation}

where $p$ is an arbitrary prime, then

\begin{equation}
\tag{3.11}
a_{n+p} \equiv a_n a_{n+1} \pmod{p} \quad (n \geq 0).
\end{equation}

Clearly (3.10) is satisfied in the present case and therefore (3.11) implies

\begin{equation}
\tag{3.12}
A_{2n+p} \equiv A_p A_{2n+1} \pmod{p}.
\end{equation}

Making use of (2.8), we may now state

**Theorem 1.** The coefficients of $g(u)$ defined by (1.6) satisfy

\begin{equation}
\tag{3.13}
A_{2n+p} \equiv -2.4.6 \cdots (p-1)A_{2n+1} \pmod{p} \quad (n = 0, 1, 2, \cdots),
\end{equation}

where $p$ is an arbitrary odd prime.

It is easily verified that (3.4) and (3.6) are in agreement with (3.13).

Since (3.12) is equivalent to

\begin{equation}
(D^p - A_p D) g(u) \equiv 0 \pmod{p},
\end{equation}

comparison with (3.8) yields

\begin{equation}
\tag{3.14}
\psi_{p-1}(g(u)) = A_p \exp\left(\frac{i}{2}g''(u)\right) = A_p \sum_{n=0}^{m} \frac{g^n(u)}{2^n n!} \pmod{p},
\end{equation}

where $p = 2m + 1$.

If we put
we can show [1, Theorem 10] that \( A_n^{(k)} \) satisfies

\[
A_n^{(k)} \equiv A_{n+p}^{(k)} \pmod{p} \quad (n \geq 0)
\]

for all \( k \geq 1 \).

We shall apply this result to the series \( \phi(u) \) defined by (2.15).

Since (3.14) is equivalent to

\[
(D^p - A_p D) g(u) \equiv 0 \pmod{p},
\]

it is clear that (2.16) implies

\[
(D^p - A_p D) \phi(u) \equiv \frac{(-1)^m}{2^{m+1}(m-1)!} \frac{g^{p+1}(u)}{p} \equiv A_p(D^p - A_p D) \frac{g^{p+1}(u)}{p} \pmod{p},
\]

where \( p = 2m + 1 \).

Now by [1, (6.12)] we have

\[
g(u) \equiv \sum_{n=0}^{\infty} A_{3n+1} \frac{g_{1}^{2n+1}(u)}{(2n+1)!} \pmod{p},
\]

where

\[
g_1(u) = u + A_p \frac{g_p(u)}{p!};
\]

moreover

\[
\frac{g_p(u)}{p!} \equiv \sum_{n=0}^{\infty} A_p \frac{x^{n(p-1)+1}}{n(p-1)+1)!} \pmod{p}.
\]

It follows from (3.16) and (3.17) that

\[
(D^p - A_p D) \frac{g_p(u)}{p!} \equiv 1 \pmod{p}.
\]

Thus (3.15) becomes

\[
(D^p - A_p D) \phi(u) \equiv -A_p g(u) \pmod{p},
\]

which is equivalent to

\[
e_{2n+p+1} \equiv A_p(e_{2n+2} - A_{3n+1}) \pmod{p} \quad (n = 0, 1, 2, \ldots).
\]

We may state
THEOREM 2. The coefficients $e_{2n}$ defined by (2.12) satisfy (3.18).

In view of (2.10) we may rewrite (3.18) as

\[(3.19) \quad A_{2n+p+2} \equiv A_p A_{2n+1} + e_{2n+p+1} \quad (2n < p) . \]

Since

\[A_p A_{2n+1} \equiv A_{2n+p} ,\]

(3.19) is equivalent to

\[(3.20) \quad A_{2n+p+2} \equiv A_{2n+p} + e_{2n+p+1} \quad (\text{mod } p) \quad (2n < p) . \]

We notice also that repeated application of (3.18) yields

\[(3.21) \quad e_{2n+k(p-1)} \equiv A_k e_{2n} - k A_{2n+k(p-1) - 1} \quad (\text{mod } p) ; \]

in particular we have for $k = p$

\[(3.22) \quad e_{2n+p(p-1)} \equiv A_p e_{2n} \quad (\text{mod } p) . \]

It is also easy to extend (3.20) to

\[(3.23) \quad A_{2n+k(p-1)+1} \equiv k A_{2n+k(p-1)-1} + e_{2n+k(p-1)} \quad (\text{mod } p) \]

\[(0 < 2n \leq p + 1 ; \quad k = 1, 2, 3, \ldots) . \]

Indeed it follows from (3.23) and (3.18) that

\[e_{2n+(k+1)(p-1)} \equiv A_p (e_{2n+k(p-1)} - A_{2n+k(p-1)-1}) \]

\[\equiv A_p e_{2n+k(p-1)} - A_{2n+(k+1)(p-1)-1} \]

\[\equiv A_p (A_{2n+k(p-1)+1} - k A_{2n+k(p-1)-1}) - A_{2n+(k+1)(p-1)-1} \]

\[\equiv A_{2n+(k+1)(p-1)+1} - (k-1) A_{2n+(k+1)(p-1)-1} . \]

Note that (3.23) does not hold for $k = 0$.

We may state the following theorem which supplements Theorem 2.

THEOREM 3. The coefficients $e_{2n}$ defined by (2.12) satisfy (3.21), (3.22) and (3.23).

4. We now derive congruences for $A_{2n+1} \pmod{8}$. From the first of (3.5) we have

\[D^4g(u) \equiv (-g(u) + 6g^3(u)) \exp(2g^3(u)) \]

\[\equiv (-g(u) + 6g^3(u))(1 + 2g^3(u)) \]

\[\equiv -g(u) + 4g^3(u) + 4g^5(u) \quad (\text{mod } 8) , \]

so that

\[(4.1) \quad D^4g(u) \equiv -g(u) \quad (\text{mod } 8) . \]
This is equivalent to

\[(4.2) \quad A_{2n+5} \equiv -A_{2n+1} \pmod{8} \quad (n = 0, 1, 2, \cdots),\]

which implies

\[(4.3) \quad A_{4n+1} \equiv A_{4n+3} \equiv (-1)^n \pmod{8} \quad (n = 0, 1, 2, \cdots).
\]

This result can however be improved without much difficulty. Working modulo 16 we find that the \(\psi_n(x)\) defined by (3.8) and (3.9) satisfy

\[
\begin{align*}
\psi_1(x) & \equiv 7x + 6x^3, \\
\psi_2(x) & \equiv -x + 6x^3, \\
\psi_3(x) & \equiv x + 4x^3;
\end{align*}
\]

note that the \(\psi_n(x)\) are here treated as finite \(H\)-series. Then by (3-8)

\[
D^8g(u) \equiv (g(u) + 4g^3(u)) \exp(4g^3(u)) \\
\equiv (g(u) + 4g^3(u))(1 + 4g^3(u)),
\]

so that

\[(4.4) \quad D^8g(u) \equiv g(u) \pmod{16}.\]

This is equivalent to

\[(4.5) \quad A_{2n+9} \equiv A_{2n+1} \pmod{16}.
\]

Since \(A_1 = A_3 = 1, A_5 = 7, A_7 = 7 \pmod{16}, (4.5)\) implies

\[(4.6) \begin{cases} A_{8n+1} \equiv A_{8n+3} \equiv 1 \pmod{16}, \\ A_{8n+5} \equiv A_{8n+7} \equiv 7 \pmod{16}.
\end{cases}\]

We may state

THEOREM 4. The coefficients \(A_{2n+1}\) satisfy (4.2), (4.3), (4.5), (4.6).

5. We now put

\[(5.1) \quad \frac{u}{g(u)} = \sum_{n=0}^{\infty} \beta_{2n} \frac{u^{2n}}{(2n)!},\]

so that

\[(5.2) \quad \sum_{r=0}^{n} \binom{2n + 1}{2r} A_{2n-2r+1} \beta_{2r} = 0 \quad (n > 0).
\]

It follows from (5.2) that the \(\beta_{2n}\) are rational numbers with odd denominators.

From (5.1) and (2.3) we have
THE INVERSE OF THE ERROR FUNCTION 469

\( \frac{u}{g(u)} = \sum_{n=0}^{\infty} \frac{c_{2n+1} g^{2n}(u)}{(2n+1)^2} \).

By (2.4)

\( c'_{2n+1} = \frac{c_{2n+1}}{2n+1} = (-1)^n \frac{1 \cdot 3 \cdot 5 \cdots (2n-1)}{2n+1} \).

Let \( p \) be an odd prime. Then for \( 2n+1 > p \), \( c'_{2n+1} \) is integral (mod \( p \)) except possibly when \( p/2n + 1 \). Let

\( 2n + 1 = kp^r, \quad p + k, \quad r \geq 1 \).

If \( k > 1 \) it is obvious from (5.4) that \( c'_{2n+1} \) is integral (mod \( p \)). If \( k = 1 \), the numerator of \( c'_{2n+1} \) is divisible by at least \( p^w \), where \( w = (p^{r-1} - 1)/2 \). But since

\( \frac{1}{2}(p^{r-1} - 1) \geq r \)

except when \( p = 3, \ r = 2 \), it follows that

\( p \frac{u}{g(u)} \equiv c_{p} \frac{g^{p-1}(u)}{(p-1)!} \quad (\text{mod } p) \quad (p > 3), \)

\( 3 \frac{u}{g(u)} \equiv - \frac{g^3(u)}{2!} - \frac{g^5(u)}{8!} \quad (\text{mod } 3). \)

In the next place we have \( [1, (6.2)] \)

\( \frac{g^{p-1}(u)}{(p-1)!} = \sum_{n=1}^{\infty} A_p^{n-1} \frac{u^{n(p-1)}}{(n(p-1))!} \quad (\text{mod } p) \)

for all \( p \). As for \( g^3(u)/8! \), we have by (3.16)

\( \frac{g^3(u)}{3!} g_1(u) - u \equiv \sum_{n=1}^{\infty} \frac{u^{2n+1}}{(2n+1)!}, \)

\( g_1(u) = 1 + \frac{1}{2} g^3(u) g'(u) = 1 + \frac{1}{2} g^3(u) = g'(u) \quad (\text{mod } 3). \)

It follows that

\( \frac{g^4(u)}{4!} = \sum_{n=1}^{\infty} (n - 2) \frac{u^{2n}}{(2n)!} \quad (\text{mod } 3) \)

and a little manipulation leads to

\( \frac{g^6(u)}{8!} = \sum_{n=1}^{\infty} \frac{u^{6n+2}}{(6n+2)!} \quad (\text{mod } 3). \)

If we recall that

\( c_p \equiv -A_p \quad (\text{mod } p) \)
and make use of (5.1), (5.3), (5.5), (5.6), (5.7) and (5.8) we get the following analog of the Staudt-Clausen theorem:

**Theorem 5.** The coefficients $\beta_{2n}$ defined by (5.1) satisfy

\begin{equation}
\beta_{2n} = \frac{b}{3} - \sum_{p > 3, p - 1|2n} \frac{A_{n/p}^{2n/(p-1)}}{p},
\end{equation}

where $G_{2n}$ is an integer,

\[ b = \begin{cases} 
2 & n \equiv 1 \pmod{3} \\
1 & n \not\equiv 1 \pmod{3} 
\end{cases} \]

and the summation is over all primes $p > 3$ such that $p - 1|2n$.

6. The following values of $A_n$ were computed by R. Carlitz in the Duke University Computing Laboratory.

\[ A_5 = 7, \quad A_7 = 127, \]
\[ A_9 = 17.257, \]
\[ A_{11} = 7.34807, \]
\[ A_{13} = 20036983, \]
\[ A_{15} = 17.134138639, \]
\[ A_{17} = 7.49020204823, \]
\[ A_{19} = 127.1634676823703, \]
\[ A_{21} = 23.1096291767620181, \]
\[ A_{25} = 7.655889589032992201^*, \]
\[ A_{26} = 17.94020690191035873697^*. \]

The numbers marked with an asterisk have not been factored completely but at any rate have no prime divisors $< 10^4$.

**References**

Mathematical papers intended for publication in the *Pacific Journal of Mathematics* should be typewritten (double spaced), and the author should keep a complete copy. Manuscripts may be sent to any one of the four editors. All other communications to the editors should be addressed to the managing editor, L. J. Paige at the University of California, Los Angeles 24, California.

50 reprints per author of each article are furnished free of charge; additional copies may be obtained at cost in multiples of 50.

The *Pacific Journal of Mathematics* is published quarterly, in March, June, September, and December. Effective with Volume 13 the price per volume (4 numbers) is $18.00; single issues, $5.00. Special price for current issues to individual faculty members of supporting institutions and to individual members of the American Mathematical Society: $8.00 per volume; single issues $2.50. Back numbers are available.

Subscriptions, orders for back numbers, and changes of address should be sent to Pacific Journal of Mathematics, 103 Highland Boulevard, Berkeley 8, California.

Printed at Kokusai Bunken Insatsusha (International Academic Printing Co., Ltd.), No. 6, 2-chome, Fujimi-cho, Chiyoda-ku, Tokyo, Japan.

PUBLISHED BY PACIFIC JOURNAL OF MATHEMATICS, A NON-PROFIT CORPORATION
The Supporting Institutions listed above contribute to the cost of publication of this Journal, but they are not owners or publishers and have no responsibility for its content or policies.
