TOPOLOGIES FOR LAPLACE TRANSFORM SPACES

Donald Earl Myers
TOPOLOGIES FOR LAPLACE TRANSFORM SPACES

DONALD E. MYERS

In this paper four topologies are compared:

(i) an $L_2$-type topology on the space of functions having bilateral transforms,
(ii) an $L_1$ and (iii) an $L_2$-type topology on the space of transforms, and
(iv) finally that of one form of convergence of compact subsets for the space of analytic functions. It is shown that sequential convergence in (i) implies (iii) and (iv) and (ii) implies (i) and (iv) and hence (iii).

In an earlier paper [2]; the author used equivalence classes of analytic functions to construct an imbedding space for Schwartz Distributions. The mechanism for constructing the mapping was the bilateral Laplace Transform, in this way the traditional approach to operational calculus was preserved. In that paper a topology was imposed on the imbedding space from the space of analytic functions. We now obtain some additional results about the possible topologies defined on the space of analytic functions.

THEOREM 1. Let $F_j(t), j = 0, 1, 2, \cdots, -\infty < t < \infty$ be real valued functions such that for each $j$

$$d_1(F_j) = \left[ \int_0^\infty | e^{-\sigma_1 t} F_j(t) |^2 \, dt \right]^{1/2} < \infty$$

and

$$d_2(F_j) = \left[ \int_0^\infty | e^{-\sigma_2 t} F_j(t) |^2 \, dt \right]^{1/2} < \infty$$

where $-\infty < \sigma_1 < \sigma_2 < \infty$. If

$$d(F_j - F_0) = d_1(F_j - F_0) + d_2(F_j - F_0) \to 0$$

as $j \to \infty$ then

(i) $f_j(z) \to f_0(z)$ uniformly on compact subsets of $\sigma_1 < R(z) < \sigma_2$ where $f_j(z) = \int_{-\infty}^{\infty} e^{-zt} F_j(t) dt$

(ii) $\| f_j - f_0 \|_z \to 0$

where

Received April 24, 1964. This research was partially supported by NSF Contract Grant NSF GP-1951.
\[ \| f_j \|_\sigma = \left[ \int_{-\infty}^{\infty} |f_j(x + iy)|^2 \, dy \right]^{1/2} \]

for each \( \sigma_1 < \sigma < \sigma_2 \).

\textbf{Proof.} From [3], pp 245, \( d_1 < \infty, \ d_2 < \infty \) implies the existence of \( f_j(z) \) with the integral defining \( f_j(z) \) converging absolutely for \( \sigma_1 < R(z) < \sigma_2 \). Rewrite this integral as

\[
f_j(z) = \int_{-\infty}^{0} e^{-t(z-\sigma_2)}e^{-\sigma_2 t}F_j(t)dt \\
+ \int_{0}^{\infty} e^{-t(z-\sigma_1)}e^{-t\sigma_1}F_j(t)dt.
\]

By the Cauchy-Schwarz Inequality

\[
|f_j(z)| \leq \left[ \frac{1}{2[\sigma_2 - R(z)]} \int_{-\infty}^{0} |e^{-\sigma_2 t}F_j(t)|^2 \, dt \right]^{1/2} \\
+ \left[ \frac{1}{2[R(z) - \sigma_1]} \int_{0}^{\infty} |e^{-\sigma_1 t}F_j(t)|^2 \, dt \right]^{1/2}.
\]

Let

\[
g_K(z) = \max_{z \in K} \left[ \sqrt{\frac{1}{2[\sigma_2 - R(z)]}}, \sqrt{\frac{1}{2[R(z) - \sigma_1]}} \right]
\]

for \( K \) an arbitrary subset of \( -\sigma_1 < R(z) < \sigma_2 \). Now

\[
\max_{z \in K} |f_j(z) - f_0(z)| \leq g_K(z)d(F_j - F_0)
\]

and (i) is established.

To prove (ii) we use an additional consequence of the theorem from [3], pp 254, namely for each \( j \)

\[
\int_{-\infty}^{\infty} |e^{-z t}F_j(t)|^2 \, dt = \int_{-\infty}^{\infty} |f_j(x + iy)|^2 \, dt
\]

for \( \sigma_1 < \sigma < \sigma_2 \). Since

\[
\int_{0}^{\infty} |e^{-\sigma_1 t}F_j(t)|^2 \, dt \leq [d_1(F_j)]^2 \\
\int_{-\infty}^{\infty} |e^{-\sigma_1 t}F_j(t)|^2 \, dt \leq [d_2(F_j)]^2
\]

it follows that

\[
\| f_j - f_0 \|^2 \leq [d_1(F_j - F_0)]^2 + [d_2(F_j - F_0)]^2.
\]

By definition \( d_1(F_j) \geq 0, \ d_2(F_j) \geq 0 \), therefore \( d(F_j - F_0) \to 0 \) implies \( d_1(F_j - F_0) \to 0 \) and \( d_2(F_j - F_0) \to 0 \) and (ii) is proved.
Although it is clear that $d(F)$ is a norm on the set of functions with $d < \infty$ and $\|f\|_2$ is a norm on a subset of the functions analytic for $\sigma_1 < R(z) < \sigma_2$, the topology of uniform convergence on compact sets gives only a countably normed space or a Fréchet metric. (See [1], pg. 139.)

**Theorem 2.** Let $f_j(z)$, $j = 0, 1, 2, \ldots$ be functions analytic for $\sigma_1 < R(z) < \sigma_2$ such that for each $j$

$$\int_{-\infty}^{\infty} |f_j(x + iy)| \, dy < \infty, \quad \sigma_1 < x < \sigma_2$$

and $\lim_{|y| \to \infty} f_j(x + iy) = 0$ uniformly on closed subintervals of $\sigma_1 < x < \sigma_2$. If $\|f_j - f\|_2 \to 0$ as $j \to \infty$ for each $\sigma_1 < x < \sigma_2$, then

(i) $d'(F_j - F_0) \to 0$ as $j \to \infty$ where

$$d'(F_j - F_0) = d'_1(F_j - F_0) + d'_2(F_j - F_0)$$

and

\[ F_j(t) = \frac{1}{2\pi} \int_{-\infty}^{\infty} e^{zt} e^{ity} f_j(x + iy) \, dy, \]

$\sigma_1 < x < \sigma_2$. (The prime denotes that the metric is the same as in Theorem 1, except that $\sigma_1$ is replaced by $x_1$ and $\sigma_2$ by $x_2$ where $\sigma_1 < x_1 < x_2 < \sigma_2$.)

(ii) $f_j(z) \to f_0(z)$ uniformly on compact subsets of $x_1 < R(z) < x_2$.

**Proof.** From [3], pg. 265 the hypotheses of the theorem are sufficient to insure that each $f_j(z)$ is a bilateral transform and also the validity of the inversion formula (1).

Since $|f_j(x + iy)| \to 0$ as $|y| \to \infty$ each $|f_j(x + iy)|$ is bounded for $\sigma_1 < x < \sigma_2$ if $|f_j(x + iy)| \leq M_j(x)$ then

$$\int_{-\infty}^{\infty} |f_j(x + iy)|^2 \, dy \leq M_j(x) \int_{-\infty}^{\infty} |f_j(x + iy)| \, dy < \infty.$$ 

Consider, for $\sigma_1 < x < x_1$

$$\int_{0}^{\infty} \left| e^{zt} F_j(t) \right|^2 \, dt = \frac{1}{(2\pi)^2} \int_{0}^{\infty} \left| e^{-t(x_1-x)} \int_{-\infty}^{\infty} e^{ity} f_j(x + iy) \, dy \right|^2 \, dt$$

$$\leq \frac{1}{(2\pi)^2} \|f_j\|_2^2 \int_{0}^{\infty} e^{-2t(x_1-x)} \, dt$$

but $0 < x_1 - x$ so that

$$C_1 = \frac{1}{2\pi} \int_{0}^{\infty} e^{-2t(x_1-x)} \, dt < \infty$$
and $d'(F_j) \leq C_1 \| f_j \|_x$. Likewise
\[
\int_{-\infty}^{0} |e^{-x^2}F_j(t)|^2 \, dt \leq \frac{1}{(2\pi)^2} \| f_j \|_x^2 \int_{-\infty}^{0} e^{t(x'-x^2)} \, dt
\]
for $x_2 < x' < \sigma_2$, or
\[
d_2(F_j) \leq C_2 \| f_j \|_{x'}, \quad \text{where} \quad C_2 = \frac{1}{2\pi} \int_{-\infty}^{0} e^{t(x'-x^2)} \, dt.
\]
If $\| f_j - f_0 \|_x \to 0$ as $j \to \infty$ for all $\sigma_1 < x < \sigma_2$ then
\[
d'(F_j - F_0) = d'(F_j - F_0) + d_2(F_j - F_0) \\
\leq C_1 \| f_j - f_0 \|_x + C_2 \| f_j - f_0 \|_{x'}
\]
or $d'(F_j - F_0) \to 0$.

Part (ii) follows by applying Theorem 1 to part (i).

In a subsequent paper the author expects to extend these to multidimensional Laplace Transforms and to Laplace Transforms on Locally Compact Abelian Groups.

REFERENCES

UNIVERSITY OF ARIZONA
Mathematical papers intended for publication in the Pacific Journal of Mathematics should be typewritten (double spaced). The first paragraph or two must be capable of being used separately as a synopsis of the entire paper. It should not contain references to the bibliography. No separate author's resume is required. Manuscripts may be sent to any one of the four editors. All other communications to the editors should be addressed to the managing editor, Richard Arens, at the University of California, Los Angeles, California 90024.

50 reprints per author of each article are furnished free of charge; additional copies may be obtained at cost in multiples of 50.

The Pacific Journal of Mathematics is published quarterly, in March, June, September, and December. Effective with Volume 13 the price per volume (4 numbers) is $18.00; single issues, $5.00. Special price for current issues to individual faculty members of supporting institutions and to individual members of the American Mathematical Society: $8.00 per volume; single issues $2.50. Back numbers are available.

Subscriptions, orders for back numbers, and changes of address should be sent to Pacific Journal of Mathematics, 103 Highland Boulevard, Berkeley 8, California.
