ON ASYMPTOTIC ESTIMATES FOR KERNELS OF CONVOLUTION TRANSFORMS

ZEEV DITZIAN
ON ASYMPTOTIC ESTIMATES FOR KERNELS OF CONVOLUTION TRANSFORMS

ZEEV DITZIAN

In this paper we shall try to answer two open questions posed by Dauns and Widder in their paper "Convolution transforms whose inversion functions have complex roots" (Pacific Journal of Mathematics, 1965, Volume 15(2), pp. 427-442) on page 441.

We shall be interested in the function $G_{2m}(t)$ defined by

$$G_{2m}(t) = \frac{1}{2\pi i} \int_{-\infty}^{\infty} e^{st} ds$$

where

$$E_{2m}(s) = \prod_{k=m+1}^{\infty} \left(1 - \frac{s^2}{a_k^2}\right)$$

where $\{a_k\}$ is a sequence of complex numbers such that

$$|\arg a_k| < \frac{\pi}{4} - \eta$$

for a fixed $\eta$, $0 < \eta < \pi/4$,

$$\sum_{k} |a_k|^{-2} < \infty, \quad 0 < \Re a_i \leq \Re a_{i+1} \text{ for all } i$$

and

$$\lim_{m \to \infty} |a_{m+1}|^2 \sum_{k=m+1}^{\infty} |a_k|^{-2} = \infty.$$ 

If a sequence $\{a_k\}$ satisfies all the above assumptions, we shall denote it by $\{a_k\} \in \text{class } C$. We obtain condition $B$, defined in [1, p. 436], if we replace (1.3) by (1.4)

$$\lim_{m \to \infty} |a_{m+1}|^{4/3} \sum_{k=m+1}^{\infty} |a_k|^{-2} = \infty.$$ 

If we take $a_k = k^{\lambda} 1/2 < \lambda < \infty$ then $\{a_k\} \in \text{class } C$, but of these sequences only those for which $1/2 < \lambda < 3/2$ satisfy condition $B$.

We define as in [1]

$$V_m = \sum_{k=m+1}^{\infty} a_k^{-2} \quad \text{and} \quad S_m = \sum_{k=m+1}^{\infty} |a_k|^{-2}$$
and whenever \( \{a_k\} \in \text{class C} \) we prove

\[
(1.6) \quad \lim_{m \to \infty} \int_{-\infty}^{\infty} |tG_{2m}(t)| \, dt = (\cos^2 \varphi_m - \sin^2 \varphi_m)^{-3/2}
\]

where

\[
\varphi_m = \frac{1}{2} \arg V_m \left( -\frac{\pi}{2} < \arg V_m < \frac{\pi}{2} \right)
\]

which answers the question posed in remark (3) [1, p. 441].

We shall also prove under the restriction \( \{a_k\} \in \text{class C} \) Corollary 4.3 and an analogous theorem to Theorem 4.1.

As a by product we shall have

\[
(1.7) \quad \lim_{m \to \infty} S_m^{1/2} \frac{d^{n}}{dt^n} G_m(S_m^{1/2} t) = \frac{1}{\sqrt{4\pi}} \left( \frac{S_m}{V_m} \right)^{1/2} \frac{d^n}{dt^n} \exp \left( -t^2 \frac{S_m}{4V_m} \right)
\]

which is more than necessary for proving other results and is an interesting estimate of \( G_m(t) \) by itself.

2. Some lemmas. In the author’s thesis [2] and in a paper in collaboration with A. Jakimovski [3; Lemma 2.1.] the following lemma was proved:

**Lemma 2.1.** Suppose \( \sum_{k=1}^{n} |a_k|^{-z} < \infty \) then the assumptions

\[
(2.1) \quad \sum_{k=m+1}^{\infty} |a_k|^{-z} = o \left( \left( \sum_{k=m+1}^{\infty} |a_k|^{-z} \right)^{1+\alpha/2} \right) \quad m \to \infty
\]

for some fixed \( \alpha > 0 \) and

\[
(2.2) \quad \lim_{m \to \infty} \left( \max_{k > m} |a_k|^{-z} \right)^{\left( \sum_{k=m+1}^{\infty} |a_k|^{-z} \right)^{-1}} = 0
\]

are equivalent, and therefore the assumptions (2.1) for all positive \( \alpha \) are equivalent.

**Proof.** Let us assume (2.1) for some \( \alpha > 0 \). If (2.3) is not valid then a subsequence \( \{m(r)\} \) of \( m + 1, m + 2, \cdots \) exists such that for some \( \beta > 0 \)

\[
\left( \max_{k \geq m(r)+1} |a_k|^{-z} \right) S_{m(r)}^{-1} \geq \beta > 0
\]

for all \( r \geq 1 \). Therefore

\[
\sum_{k=m(r)+1}^{\infty} |a_k|^{-z} \geq \left( \max_{k \geq m(r)+1} |a_k|^{-z} \right)^{1+\alpha/2} \geq \beta^{1+(\alpha/2)} S_{m(r)}^{1+(\alpha/2)}
\]

which contradicts (2.1).
Assuming (2.2) then
\[
\sum_{k=m+1}^{\infty} |a_k|^{-\alpha} = \sum_{k=m+1}^{\infty} |a_k|^{-\alpha} \leq \left( \max_{k \geq m+1} |a_k|^{-\alpha} \right) S_m
\]
\[
= \left( \max_{k \geq m+1} |a_k|^{-\alpha} \right) S_{m}^{-1} \frac{\alpha/2}{S_{m}^{1-(\alpha/2)}}
\]
\[
= o\left(S_{m}^{1-(\alpha/2)}\right) \quad (m \to \infty).
\]

The following two lemmas are easy to verify.

**Lemma 2.2.** If \(\{a_k\} \in \text{class } C\) then \(\{a_k\}\) satisfies assumption (2.2). If \(|\arg a_k| < \pi/4 - \eta, 0 < \text{Re } a_i \leq \text{Re } a_{i+1}\) and \(\{a_k\}\) satisfies assumption (2.2) then \(\{a_k\} \in \text{class } C\).

**Lemma 2.3.** If \(|\arg a_k| < (\pi/4) - \eta\) and \(\sum |a_k|^{-2} < \infty\), then
\[
\cos \left(\frac{\pi}{2} - 2\gamma \right) S_m \leq |V_m| \leq S_m.
\]

We define now \(F_m'(z)\) by
\[
F_m'(z) = E_m(z \cdot S_m^{-1/2}) = \sum_{k=m+1}^{\infty} \left( 1 - \frac{y^2}{a_k^2 S_m} \right).
\]

**Lemma 2.4.** Suppose \(\{a_k\} \in \text{class } C\) then there exist constants \(k(p) > 0\) independent of \(m\) so that for all real \(y\)
\[
|F_m'(iy)| > 1 + k(p)y^{2p} \quad \text{for } m > m_0(p).
\]

**Proof.** Define \(a_k = |a_k| e^{i\beta_k}, - (\pi/4) + \eta < \beta_k < (\pi/4) - \eta\)
\[
|F_m(iy)| = \left| \prod_{k=m+1}^{\infty} \left( 1 - \frac{(iy)^2}{a_k^2 S_m} \right) \right|
\]
\[
\geq \prod_{k=m+1}^{\infty} \left( 1 - \frac{y^2}{a_k^2 S_m} \right) \cos 2\beta_k
\]
\[
\geq \prod_{k=m+1}^{\infty} \left( 1 + \frac{y^2 \cos \left(\frac{\pi}{2} - 2\gamma \right)}{a_k^2 S_m} \right)
\]
\[
= 1 + \sum_{p=1}^{\infty} \frac{y^{2p} \cos \left(\frac{\pi}{2} - 2\eta \right)}{S_m^{2p} \cdot p!} \sum_{k(1) > m} \cdots \sum_{k(p) > m} |a_{k(1)} \cdots a_{k(p)}|^{-2}.
\]

Since we have \(\lim_{m \to \infty} \max_{k > m} |a_k|^{-2} S_m^{-1} = 0\) we can find \(m_0(p)\) so that for \(m > m_0(p)\) \(\max_{k > m} |a_k|^{-2} < (1/2p) S_m\). Therefore we have
\[
\sum_{k(i) > m \atop k(j) \neq k(j), i \neq j} \left| a_{k(1)} \cdots a_{k(p)} \right|^2
= \sum_{k(i) > m \atop k(j) \neq k(j), i \neq j} \left( S_m - \sum_{t=1}^{p-1} \left| a_{k(t)} \right|^2 \right) \left| a_{k(1)} \cdots a_{k(p-1)} \right|^2
\geq \frac{1}{2} S_m \sum_{k(i) > m \atop k(j) \neq k(j), j \neq j} \left| a_{k(1)} \cdots a_{k(p-1)} \right|^2 \geq \left( \frac{1}{2} \right)^p S_m^p.
\]

Hence

\[
|F_m(iy)| \geq 1 + y^{2p} \frac{\cos \left( \frac{\pi}{2} - 2\gamma \right) S_m^p}{S_m^p 2^p} = 1 + k(p) y^{2p}.
\]

3. The asymptotic estimates for \(G_{2m}^{(k)}(t)\).

**Theorem 3.1.** Let \(\{a_k\} \in \text{class C; then for all} n = 0, 1, \cdots\)

\[
(3.1) \quad \lim_{m \to \infty} S_m^{1/2} \frac{d^n}{dt^n} G_{2m}(S_{m}^{1/2} t) = \frac{1}{\sqrt{4\pi}} \left( \frac{S_m}{V_m} \right)^{1/4} \frac{d^n}{dt^n} \exp \left( -\frac{t^2}{4V_m} \right)
\]

uniformly in \(-\infty < t < \infty\) (we choose \(V_m^{1/2} = (1/2) \arg V_m\)).

**Proof.** Following the proof of the special case \(n = 0\) and \(\arg_k a_k = 0\) by Hirschman—Widder [4; pp. 140-1] we have

\[
S_m^{1/2} G_{2m}(S_{m}^{1/2} t) = \frac{1}{2\pi i} \int_{-\infty}^{\infty} e^{zt} dz \frac{d^n}{dt^n} \left( \frac{S_m}{V_m} \right) = \frac{1}{2\pi} \int_{-\infty}^{\infty} e^{iy} dy \cdot
\]

By an estimate of [5; p. 246] we have for \(|z| < R\) and

\[
R \cdot \left| a_k \right| S_m^{1/2} \right|^{-1} \leq \frac{1}{2}
\]

\[
\left| \log \left( \left( 1 - \frac{z^2}{a_k S_m} \right) \exp \left( z^2/a_k S_m \right) \right) \right| \leq 4R^3 \frac{1}{\left| a_k \right|^3 S_m^{3/2}}.
\]

Recalling that \(\sum_{k=m+1}^{\infty} 1/a_k^2 S_m = V_m/S_m\) and since by Lemma 2.1

\[
\sum_{k=m+1}^{\infty} \frac{1}{a_k^2 S_m^{3/2}} = o(1) \quad m \to \infty,
\]

we have for \(|z| < R\) and \(m > m_0(R)\)

\[
\left| F_m(z) - \exp \left( -\frac{V_m z^2}{S_m} \right) \right| < \varepsilon_1.
\]

Since by Lemma 2.4 \(R > R_0(\varepsilon_2, \gamma)\) implies

\[
\int_{-R}^{R} \left| y \left| n \frac{dy}{F_m(iy)} \right| < \varepsilon_2 \quad \text{and} \quad \int_{-\infty}^{\infty} \left| y \left| n \frac{dy}{F_m(iy)} \right| < \varepsilon_2\right.
\]
we have
\[ S_m^{1/2} \frac{d^n}{dt^n} G_{2m}(S_m^{1/2} t) \]
\[ = \frac{1}{2\pi} \int_{-\infty}^{\infty} \frac{(iy)^n e^{iyt}}{F_m(iy)} \, dy \]
\[ = \frac{1}{2\pi} \int_{-\infty}^{\infty} (iy)^n \exp \left( -\frac{V_m y^2 + iyt}{S_m} \right) \, dy + o(1) \]
\[ = \frac{d^n}{dt^n} \left\{ \exp \left( -\frac{t^2 S_m}{4 \sqrt{V_m}} \right) \right\} \times \frac{1}{2\pi} \int_{-\infty}^{\infty} \exp \left[ -\left( V_m^{1/2} S_m^{-1/2} y - it S_m^{1/2} (4 V_m)^{-1/2} y^2 \right) \right] \, dy + o(1) \]
\[ = \left( \frac{S_m}{V_m} \right)^{1/2} \frac{d^n}{dt^n} \left\{ \exp \left( -\frac{t^2 S_m}{4 \sqrt{V_m}} \right) \right\} \frac{1}{2\pi} \int_{-\infty}^{\infty} e^{-z^2} \, dz + o(1) \]
\[ = \frac{1}{\sqrt{4\pi}} \left( \frac{S_m}{V_m} \right)^{1/2} \frac{d^n}{dt^n} \left( \frac{-t^2 S_m}{4 \sqrt{V_m}} \right) + o(1) \quad (m \uparrow \infty) \]

using the residue theorem, the fact that \( e^{-z^2} \) is entire and that \( |\arg V_m^{1/2}| < \frac{\pi}{4} \) for all \( m \).

As a corollary we derive

**Theorem 3.2.** If \( \{a_k\} \) satisfies assumption C then

(3.2) \[ \int_{-\infty}^{\infty} |G_{2m}(t)| \, dt = (\cos^2 \varphi_m - \sin^2 \varphi_m)^{-1/2} + o(1) \quad m \to \infty \]

and

(3.3) \[ \int_{-\infty}^{\infty} |t G'_{2m}(t)| \, dt = (\cos^2 \varphi_m - \sin^2 \varphi_m)^{-3/2} + o(1) \quad m \to \infty \]

where \( 2\varphi_m = \arg V_m \).

**Proof.** Since by Lemma 2.4 of [1].

(3.4) \[ |G_{2m}(t)| < MS_m^{-1/2} \exp \left( -KS_m^{-1/2} |t| \right) \]

we have

\[ \int_{-\infty}^{\infty} |G_{2m}(t)| \, dt = \int_{-\infty}^{\infty} |S_m^{1/2} G_m(S_m^{1/2} t)| \, dt = \int_{-R}^{R} |S_m^{1/2} G_m(S_m^{1/2} t)| \, dt \]
\[ + o(1) \quad (R \uparrow \infty) . \]

This combined with (3.1) and a simple integration yield (3.2).

To prove (3.3) we use Lemma 3.2 case A (since for \( \{a_k\} \in \text{class } C \)
\[ S_m \geq 4r_m^{-2} \equiv 4 |a_m|^{-2} \text{ for } m > m_0 \] which is
\[ |G'_{2m}(t)| \leq M^{-1}_m \exp \left( -K_{1m}^{-1/2} | t | \right). \]

Therefore we have

\[ \int_{-\infty}^{\infty} \left| S_m t G'_{2m}(S_{m}^{1/2} | t |) \right| dt \leq M \left( \frac{1}{K_{1m}} \right)^{1/2} e^{-K_{1}R} = o(1) \quad R \to \infty. \]

This implies

\[
\int_{-\infty}^{\infty} | tG'_{2m}(t) | \ dt = \int_{-\infty}^{\infty} | S_m t G'_{2m}(S_{m}^{1/2}t) | \ dt \\
= \frac{1}{2\sqrt{4\pi}} \left| \frac{S_{m}}{V_{m}} \right| \left| \int_{-\infty}^{\infty} t^2 \exp \left( -\frac{t^2}{4} S_m \Re \frac{1}{V_{m}} \right) dt + o(1) \right|
= \left( \frac{|V_{m}|^{-1}}{\Re(V_{m}^{-1})} \right)^{3/2} + o(1) = (\cos \varphi_m - \sin \varphi_m)^{-3/2} + o(1) \quad (m \uparrow \infty). \]

4. Remarks. I. For the theorems and the lemmas proved in this paper \( 0 < \Re a_i \leq \Re a_{i+1} \) is not essential and the condition (2.2) can replace it and (1.3).

II. Theorem 3.1 which replaces Theorem 4.1 yields for the case \( n = 0 \) only the following

\[ G_{2m}(t) = (4\pi V_{m})^{-1/2} \exp \left( -t^2/4 V_{m} \right) + o(S_{m}^{-1/2}) \quad m \to \infty \]

but if one follows the proof of Theorem 4.1 of [1] and Lemma 4.2 of [1] almost literally one obtains for \( \{a_k\} \in \text{class C} \)

\[ G_{2m}(t) = (4\pi V_{m})^{-1/2} \exp \left( -t^2/4 V_{m} \right) + o(|a_{m+1}|^{-2} S_{m}^{-3/5}) \quad m \to \infty \]

which is somewhat more general.

Mathematical papers intended for publication in the Pacific Journal of Mathematics should be typewritten (double spaced). The first paragraph or two must be capable of being used separately as a synopsis of the entire paper. It should not contain references to the bibliography. Manuscripts may be sent to any one of the four editors. All other communications to the editors should be addressed to the managing editor, Richard Arens at the University of California, Los Angeles, California 90024.

50 reprints per author of each article are furnished free of charge; additional copies may be obtained at cost in multiples of 50.

The Pacific Journal of Mathematics is published monthly. Effective with Volume 16 the price per volume (3 numbers) is $8.00; single issues, $3.00. Special price for current issues to individual faculty members of supporting institutions and to individual members of the American Mathematical Society: $4.00 per volume; single issues $1.50. Back numbers are available.

Subscriptions, orders for back numbers, and changes of address should be sent to Pacific Journal of Mathematics, 103 Highland Boulevard, Berkeley 8, California.

Printed at Kokusai Bunken Insatsusha (International Academic Printing Co., Ltd.), No. 6, 2-chome, Fujimi-cho, Chiyoda-ku, Tokyo, Japan.
