A BILATERAL GENERATING FUNCTION FOR THE ULTRASPHERICAL POLYNOMIALS

S. K. CHATTERJEA

The following differentiation formula for the Ultraspherical polynomials $P_n^\lambda(x)$ was given by Tricomi:

$$(1.1)\qquad P_n^\lambda\left(\frac{x}{\sqrt{x^2-1}}\right)=\frac{(-1)^n(x^2-1)^{\lambda+1/2n}}{n!}D^n(x^2-1)^{-\lambda}\,.$$

The object of this paper is to point out that the formula of Tricomi leads us to the following bilateral generating function for the Ultraspherical polynomials:

THEOREM.
If $F(x,t)=\sum_{m=0}^{\infty}a_m t^m P_m^\lambda(x)$,
then

$$(1.2)\qquad \rho^{-2\lambda}F\left(\frac{x-t}{\rho}\,,\frac{ty}{\rho}\right)=\sum_{r=0}^{\infty}t^r b_r(y)P_r^\lambda(x)\,,$$

where

$$b_r(y)=\sum_{m=0}^{\infty}\binom{r}{m}a_m y^m\,,\qquad \textit{and}\qquad \rho=(1-2xt+t^2)^{1/2}\,.$$

Starting from the formula (1.2), one can derive a large number of bilateral generating functions for the Ultraspherical polynomials by attributing different values to a_m.

2. Proof of the main formula (1.2). We first note from (1.1) that

$$(2.1)\qquad \left(\frac{1}{\sqrt{x^2-1}}\right)^n P_n^\lambda\left(\frac{x}{\sqrt{x^2-1}}\right)=\frac{(-1)^n}{n!}(x^2-1)^\lambda D^n(x^2-1)^{-\lambda}\,.$$

Now let

$$F\left(\frac{x}{\sqrt{x^2-1}}\,,\quad\frac{t}{\sqrt{x^2-1}}\right)=\sum_{m=0}^{\infty}a_m\left(\frac{t}{\sqrt{x^2-1}}\right)^m P_m^\lambda\left(\frac{x}{\sqrt{x^2-1}}\right)$$

be a given generating function for $P_n^\lambda(x)$. Replacing t by ty and multiplying both sides by $(x^2-1)^{-\lambda}$ and then operating e^{-tD}, we get

$$(2.2)\qquad \begin{aligned} &e^{-tD}(x^2-1)^{-\lambda}F\left(\frac{x}{\sqrt{x^2-1}}\,,\quad\frac{ty}{\sqrt{x^2-1}}\right)\\ &\quad=e^{-tD}(x^2-1)^{-\lambda}\sum_{m=0}^{\infty}a_m\left(\frac{ty}{\sqrt{x^2-1}}\right)^m P_m^\lambda\left(\frac{x}{\sqrt{x^2-1}}\right)\,.\end{aligned}$$

Since we know that

$$e^{-tD}f(x) = f(x-t)\,, \tag{2.3}$$

the left member of (2.2) is equal to

$$\{(x-t)^2-1\}^{-\lambda}F\Big(\frac{x-t}{\sqrt{(x-t)^2-1}}\,,\quad \frac{ty}{\sqrt{(x-t)^2-1}}\Big)\,.$$

But the right member of (2.2) is equal to

$$\begin{aligned}
&\sum_{m=0}^{\infty} a_m(ty)^m e^{-tD}(x^2-1)^{-\lambda}\Big(\frac{1}{\sqrt{x^2-1}}\Big)^m P_m^{\lambda}\Big(\frac{x}{\sqrt{x^2-1}}\Big)\\
&= \sum_{m=0}^{\infty} a_m(ty)^m e^{-tD}\Big\{\frac{(-1)^m}{m!}D^m(x^2-1)^{-\lambda}\Big\}\\
&= \sum_{m=0}^{\infty} a_m(ty)^m \sum_{r=0}^{\infty}\frac{(-t)^r}{r!}D^r\Big\{\frac{(-1)^m}{m!}D^m(x^2-1)^{-\lambda}\Big\}\\
&= \sum_{m=0}^{\infty} a_m y^m \sum_{r=0}^{\infty}\frac{(-t)^{r+m}}{r!\,m!}D^{r+m}(x^2-1)^{-\lambda}\\
&= (x^2-1)^{-\lambda}\sum_{m=0}^{\infty} a_m y^m \sum_{r=0}^{\infty}\binom{r+m}{m}t^{r+m}\Big(\frac{1}{\sqrt{x^2-1}}\Big)^{r+m}P_{r+m}^{\lambda}\Big(\frac{x}{\sqrt{x^2-1}}\Big)\\
&= (x^2-1)^{-\lambda}\sum_{r=0}^{\infty}\Big(\frac{t}{\sqrt{x^2-1}}\Big)^r P_r^{\lambda}\Big(\frac{x}{\sqrt{x^2-1}}\Big)\sum_{m=0}^{r}\binom{r}{m}a_m y^m\,.
\end{aligned}$$

It follows therefore that: If

$$F\Big(\frac{x}{\sqrt{x^2-1}}\,,\quad \frac{t}{\sqrt{x^2-1}}\Big) = \sum_{m=0}^{\infty} a_m\Big(\frac{t}{\sqrt{x^2-1}}\Big)^m P_m^{\lambda}\Big(\frac{x}{\sqrt{x^2-1}}\Big)\,,$$

then

$$\begin{aligned}
&\Big\{\frac{(x-t)^2-1}{x^2-1}\Big\}^{-\lambda}F\Big(\frac{x-t}{\sqrt{(x-t)^2-1}}\,,\quad \frac{ty}{\sqrt{(x-t)^2-1}}\Big)\\
&\qquad = \sum_{r=0}^{\infty}\Big(\frac{t}{\sqrt{x^2-1}}\Big)^r b_r(y)P_r^{\lambda}\Big(\frac{x}{\sqrt{x^2-1}}\Big)\,,
\end{aligned} \tag{2.4}$$

where $b_r(y) = \sum_{m=0}^{r}\binom{r}{m}a_m y^m$. Now changing $x(x^2-1)^{-1/2}$ into x and then t into $t(x^2-1)^{-1/2}$, we obtain the theorem mentioned in the introduction.

3. Some applications of the theorem.

(A) First we consider the generating function of Truesdell:

$$e^{xt}\,{}_0F_1\Big(-;\lambda+\frac{1}{2}\,;\frac{t^2(x^2-1)}{4}\Big) = \sum_{m=0}^{\infty}\frac{t^m}{(2\lambda)_m}P_m^{\lambda}(x)\,. \tag{3.1}$$

Thus if we take $a_m = 1/(2\lambda)_m$ in our theorem, we obtain

$$\rho^{-2}\exp\Big\{\frac{yt(x-t)}{\rho^2}\Big\}\,{}_0F_1\Big(-;\lambda+\frac{1}{2}\,;\frac{y^2t^2(x^2-1)}{4\rho^4}\Big) = \sum_{r=0}^{\infty}t^r b_r(y)P_r^{\lambda}(x)\,.$$

But we notice that

$$b_r(y) = {}_1F_1(-r; 2\lambda; -y) = \frac{r!}{(2\lambda)_r} L_r^{(2\lambda-1)}(-y) .$$

Hence we derive the following generating function of Weisner [3].

$$\rho^{-2\lambda} \exp\left\{\frac{-yt(x-t)}{\rho^2}\right\} {}_0F_1\left(-; \lambda + \frac{1}{2}; \frac{y^2t^2(x^2-1)}{4\rho^4}\right) = \sum_{r=0}^{\infty} \frac{r!\, L_r^{(2\lambda-1)}(y)}{(2\lambda)_r} t^r P_r^{\lambda}(x) . \tag{3.2}$$

Thus we remark that the bilateral generating function of Weisner is a particular case of our theorem. Moreover we have obtained the theorem by a method different from that used by Weisner or from that used by Rainville [2].

(B) If we consider the formula of Brafman:

$$(1-xt)^{-\gamma} {}_2F_1\left(\frac{1}{2}\gamma, \frac{1}{2}\gamma + \frac{1}{2}; \lambda + \frac{1}{2}; \frac{t^2(x^2-1)}{(1-xt)^2}\right) = \sum_{m=0}^{\infty} \frac{(\gamma)_m t^m}{(2\lambda)_m} P_m^{\lambda}(x) , \tag{3.3}$$

then we put $a_m = (\gamma)_m/(2\lambda)_m$ in our theorem and we obtain

$$\rho^{2(\gamma-\lambda)}\{\rho^2 + yt(x-t)\}^{-\gamma} {}_2F_1\left(\frac{1}{2}\gamma, \frac{1}{2}\gamma + \frac{1}{2}; \lambda + \frac{1}{2}; \frac{y^2t^2(x^2-1)}{(\rho^2 + yt(x-t))^2}\right) = \sum_{r=0}^{\infty} {}_2F_1(-r, \gamma; 2\lambda; y) t^r P_r^{\lambda}(x) . \tag{3.4}$$

(C) Next we consider the following generating function of Bateman:

$${}_0F_1\left(-; \lambda + \frac{1}{2}; \frac{t(x-1)}{2}\right) {}_0F_1\left(-; \lambda + \frac{1}{2}; \frac{t(x+1)}{2}\right) = \sum_{m=0}^{\infty} \frac{t^m}{(2\lambda)_m \left(\lambda + \frac{1}{2}\right)_m} P_m^{\lambda}(x) . \tag{3.5}$$

Here we set $a_m = 1/\{(2\lambda)_m(\lambda + 1/2)_m\}$ in our theorem and we derive

$$\rho^{-2\lambda} {}_0F_1\left(-; \lambda + \frac{1}{2}; \frac{yt(t-x+\rho)}{2\rho^2}\right) {}_0F_1\left(-; \lambda + \frac{1}{2}; \frac{yt(t-x-\rho)}{2\rho^2}\right) = \sum_{r=1}^{\infty} {}_1F_2\left(-r; 2\lambda, \lambda + \frac{1}{2}; y\right) t^r P_r^{\lambda}(x) . \tag{3.6}$$

(D) Lastly if we consider the following generating function of Brafman:

$$
\begin{aligned}
&{}_2F_1\left(\gamma, 2\lambda-\gamma; \lambda+\frac{1}{2}; \frac{1-t-\rho}{2}\right) x \\
&{}_2F_1\left(\gamma, 2\lambda-\gamma; \lambda+\frac{1}{2}; \frac{1+t-\rho}{2}\right) \\
&\quad = \sum_{m=0}^{\infty} \frac{(\gamma)_m (2\lambda-\gamma)_m}{(2\lambda)_m \left(\lambda+\frac{1}{2}\right)_m} t^m P_m^{\lambda}(x) ;
\end{aligned} \tag{3.7}
$$

we put

$$
a_m = \frac{(\gamma)_m (2\lambda-\gamma)_m}{(2\lambda)_m \left(\lambda+\frac{1}{2}\right)_m}
$$

in our theorem and thus we obtain

$$
\begin{aligned}
&\rho^{-2\lambda}\, {}_2F_1\left(\gamma, 2\lambda-\gamma; \lambda+\frac{1}{2}; \frac{\rho+yt-\omega}{2\rho}\right) x \\
&{}_2F_1\left(\gamma, 2\lambda-\gamma; \lambda+\frac{1}{2}; \frac{\rho-yt-\omega}{2\rho}\right) \\
&\quad = \sum_{r=0}^{\infty} {}_3F_2\left(-r, \gamma, 2\lambda-\gamma; 2\lambda, \lambda+\frac{1}{2}; y\right) t^r P_r^{\lambda}(x) ;
\end{aligned} \tag{3.8}
$$

where

$$
\omega = [1 - 2xt(1-y) + t^2(1-y)^2]^{1/2} .
