ABSOLUTE SUMMABILITY BY RIESZ MEANS

PREM CHANDRA

In this paper we ensure the absolute Riesz summability of Lebesgue-Fourier series under more liberal conditions imposed upon the generating function of Lebesgue-Fourier series and by taking more general type of Riesz means than whatever the present author has previously taken in proving the corresponding result. Also we give a refinement over the criterion previously proved by author himself.

1. Definitions and notations. Let $\sum_{n=0}^{\infty} a_n$ be a given infinite series with the sequence of partial sums $\{s_n\}$. Throughout the paper we suppose that

$$\lambda_n = \mu_0 + \mu_1 + \mu_2 + \cdots + \mu_n \longrightarrow \infty, \text{ as } n \longrightarrow \infty . \tag{1.1}$$

The sequence-to-sequence transformation

$$t_n = \frac{1}{\lambda_n}\sum_{\nu=0}^{n} \mu_\nu s_\nu , \tag{1.2}$$

defines the Riesz means of sequence $\{s_n\}$ (or the series $\sum_{n=0}^{\infty} a_n$) of the type $\{\lambda_{n-1}\}$ and order unity.[1] If $t_n \to s$, as $n \to \infty$, the sequence $\{s_n\}$ is said to be summable $(R, \lambda_{n-1}, 1)$ to the sum s and if, in addition, $\{t_n\} \in BV$,[2] then it is said to be absolutely summable $(R, \lambda_{n-1}, 1)$, or summable $|R, \lambda_{n-1}, 1|$ and symbolically we write $\sum_{n=0}^{\infty} a_n \in |R, \lambda_{n-1}, 1|$.

The series $\sum_{n=1}^{\infty} a_n \in |R, \lambda_{n-1}, 1|$, if

$$\sum_{n=0}^{\infty} \left| \frac{\Delta\lambda_n}{\lambda_n\lambda_{n+1}} \sum_{\nu=0}^{n} \lambda_\nu a_{\nu+1} \right| < \infty .$$

Let $f(t)$ be a periodic function with period 2π and integrable in the sense of Lebesgue over $(-\pi, \pi)$. Without any loss of generality the constant term of the Lebesgue-Fourier series of $f(t)$ can be taken to be zero, so that

$$\int_{-\pi}^{\pi} f(t)dt = 0 ,$$

and

$$f(t) \sim \sum_{n=1}^{\infty} (a_n \cos nt + b_n \sin nt) = \sum_{n=1}^{\infty} A_n(t) .$$

---

[1] It is some-times called $(\bar{N}, \mu_n)$ mean, or (R, μ_n) mean, or Riesz's discrete mean of 'type' λ_{n-1} and 'order' unity and is, in fact, equivalent to the usually known $(R, \lambda_{n-1}, 1)$ mean. An explicit proof of it is contained in Iyer [**6**]. Also see Dikshit [**3**].

[2] '$\{t_n\} \in BV$' means $\sum_n |\Delta t_n| < \infty$, when $\Delta t_n = t_n - t_{n+1}$.

We use the following notations:

$$\phi(t) = \frac{1}{2}\{f(x+t) + f(x-t)\}\ . \tag{1.3}$$

$$\Lambda(t) = \frac{1}{t}\int_0^t u d\phi(u)\ . \tag{1.4}$$

$$K(n, t) = \sum_{\nu=0}^{n} \frac{\lambda_\nu}{(\nu+1)} \sin(\nu+1)t\ . \tag{1.5}$$

2. Introduction. Recently the present author [2] has established the following theorem concerning the absolute Riesz summability of Lebesgue-Fourier series of the type $\exp(n^\alpha)(0 < \alpha < 1)$ and order unity.

THEOREM A. *If* (i) $\phi(t) \in BV(0, \pi)$ *and* (ii) $\Lambda(t)(\log k/t)^{1+\varepsilon} \in BV(0, \pi)$, *where* $\varepsilon > 0$ *and* $k \geqq \pi e^2$, *then* $\sum_{n=1}^{\infty} A_n(x) \in |R, \exp(n^\alpha), 1|(0 < \alpha < 1)$.

By using the technique, which Mohanty [7] used in establishing the criterion for the absolute convergence of a Lebesgue-Fourier series at a point, which is the analogue for absolute convergence of the classical Hardy-Littlewood convergence criterion [4, 5], we have recently established the following:

THEOREM B. *If* (i) $\phi(t) \in BV(0, \pi)$, (ii) $\Lambda(t)(\log k/t)^{1+\varepsilon} \in BV(0, \pi)$, *where* $\varepsilon > 0, k \geqq \pi e^2$ *and* (iii) $\{n^\alpha A_n(x)\} \in BV$, *for* $0 < \alpha < 1$, *then* $\sum_{n=1}^{\infty} |A_n(x)| < \infty$.

The purpose of this paper is to ensure the absolute Riesz summability of Lebesgue-Fourier series under more liberal condition imposed upon the generating function of Lebesgue-Fourier series and taking more general type of Riesz means.

We first prove the following general theorem.

THEOREM 1. *Let, for* $0 < \alpha < 1$, *the strictly increasing sequences* $\{\lambda_n\}$ *and* $\{g(n)\}$, *of nonnegative terms, tending to infinity with* n, *satisfy the following conditions*:

$$\log\frac{\pi}{t} = O\{g(k/t)\};\ as\ t \to 0\ , \tag{2.1}$$

$$\{\lambda_n/(n+1)\}\nearrow\ with\ n \geqq n_0\ , \tag{2.2}$$

$$n^{1-\alpha}\Delta\lambda_n = O\{\lambda_{n+1}\};\ as\ n \to \infty\ , \tag{2.3}$$

$$(2.4)\quad \begin{cases} \text{(i)} & \{x/g(x)\}\nearrow \textit{ with } x\,, \\ \text{(ii)} & x\dfrac{d}{dx}\Big(\dfrac{1}{g(k/x)}\Big)\nearrow \textit{ with } x\,, \\ \text{(iii)} & \dfrac{d}{dx}\Big(\dfrac{1}{g(k/x)}\Big)\searrow \textit{ with } x\,. \end{cases}$$

$$(2.5)\quad \begin{cases} \text{(i)} & \Big[\dfrac{d}{dt}\Big(\dfrac{1}{g(k/t)}\Big)\Big]_{t=1/n} = O\{n/g(n)\}\,, \\ \text{(ii)} & \sum_{n=1}^{\infty}(ng(n))^{-1} < \infty\,. \end{cases}$$

Then, if $\phi(t)\in BV(0,\pi)$ *and* $\Lambda(t)g(k/t)\in BV(0,\pi)$, *the series*

$$\sum_{n=1}^{\infty} A_n(x)\in |R, \lambda_{n-1}, 1|\,,$$

where k *is a suitable positive constant such that* $g(k/t)>0$ *for* $t>0$.

3. We shall use the following order-estimates, uniformly in $0<t\leqq\pi$.

$$K(n,t) = O\{t^{-1}\lambda_n/(n+1)\}\,. \tag{3.1}$$

$$\int_0^t \frac{\sin(n+1)u}{ug(k/u)}du = O\{1/g(n+1)\}\,. \tag{3.2}$$

$$\int_0^t \sin(n+1)u\frac{d}{du}\Big(\frac{1}{g(k/u)}\Big)du = O\{1/g(n+1)\}\,. \tag{3.3}$$

Proof of 3.1. By using Abel's Lemma and (2.2), the proof follows.

Proof of 3.2. *Case* (I). When $(n+1)^{-1}\leqq t$, we have

$$\begin{aligned}\int_0^t \frac{\sin(n+1)u}{ug(k/u)}du &= \Big(\int_0^{(n+1)^{-1}} + \int_{(n+1)^{-1}}^t\Big)\frac{\sin(n+1)u}{ug(k/u)}du \\ &= I_1 + I_2,\ \text{say}\,.\end{aligned}$$

Now, since $|\sin(n+1)u|\leqq(n+1)u$, we have

$$I_1 = O\Big\{(n+1)\int_0^{(n+1)^{-1}}\frac{1}{g(k/u)}du\Big\} = O\{1/g(n+1)\}\,.$$

And, by the second mean value theorem and (2.4)(i) we have

$$I_2 = O\{1/g(n+1)\}\,.$$

Case (II). When $(n+1)^{-1}>t$, we have

$$\int_0^t \frac{\sin (n+1)u}{ug(k/u)}du = \left(\int_0^{(n+1)^{-1}} - \int_t^{(n+1)^{-1}}\right)\frac{\sin (n+1)u}{ug(k/u)}du$$
$$= I_1 - I_2', \text{ say .}$$

Proceeding as in I_1, for I_2', we obtain

$$I_2' = O\{1/g(n+1)\} .$$

This completes the proof.

Proof of (3.3). In view of (2.4)(ii), (2.4)(iii) and (2.5)(i), the proof runs parallel to that of (3.2).

4. We require the following lemmas, for the proof of the theorems.

LEMMA 1. *If* $F(x) \in BV(a, b)$, *then it can be expressed as* $(F_1(x) - F_2(x))$ *where* $F_1(x)$ *and* $F_2(x)$ *are positive, bounded and monotonic increasing functions in* (a, b) (see Carslaw [1], p. 83).

LEMMA 2 (Pati [8]). *If* (i) $\sum_{n=1}^{\infty} a_n \in |R, \lambda_n, k| (k>0)$, (ii) $\{\lambda_n/\lambda_{n+1}\} \in BV$ *and* (iii) $\{a_n\lambda_n/(\lambda_n - \lambda_{n-1})\} \in BV$, *then* $\sum_{n=1}^{\infty} |a_n| < \infty$.

5. **Proof of Theorem 1.** We have

$$\begin{aligned} A_n(x) &= \frac{2}{\pi}\int_0^{\pi} \phi(t) \cos ntdt \\ &= \frac{2}{\pi}\left[\frac{\sin nt}{n}\phi(t)\right]_0^{\pi} - \frac{2}{\pi}\int_0^{\pi} \frac{\sin nt}{n} d\phi(t) \\ &= -\frac{2}{\pi}\int_0^{\pi} \frac{\sin nt}{n} d\phi(t) \\ &= -\frac{2}{\pi}\left[\frac{\sin nt}{n}\Lambda(t)\right]_0^{\pi} + \frac{2}{\pi}\int_0^{\pi} \Lambda(t) t \frac{\partial}{\partial t}\left(\frac{\sin nt}{nt}\right)dt \\ &= \frac{2}{\pi}\int_0^{\pi} \Lambda(t) g(k/t) \frac{t}{g(k/t)} \frac{\partial}{\partial t}\left(\frac{\sin nt}{nt}\right)dt , \end{aligned}$$

integrating by parts.

In view of Lemma 1 and second mean value theorem, the series $\sum_{n=1}^{\infty} A_n(x) \in |R, \lambda_{n-1}, 1|$, if

$$\Sigma = \sum_{n=0}^{\infty} \left| \frac{\Delta\lambda_n}{\lambda_n\lambda_{n+1}} \sum_{\nu=0}^{n} \frac{\lambda_\nu}{(\nu+1)} \int_0^t \frac{u}{g(k/u)} \frac{\partial}{\partial u}\left(\frac{\sin (\nu+1)u}{u}\right)du \right| = O(1) ,$$

uniformly in $0 < t \leqq \pi$. And, now

$$\int_0^t \frac{u}{g(k/u)} \frac{\partial}{\partial u}\left(\frac{\sin(\nu+1)u}{u}\right)du = \frac{\sin(\nu+1)t}{g(k/t)} - \int_0^t \frac{\sin(\nu+1)u}{ug(k/u)}du - \int_0^t \sin(\nu+1)u \frac{\partial}{\partial u}\left(\frac{1}{g(k/u)}\right)du .$$

Therefore

$$\begin{aligned} \sum &\leqq \frac{1}{g(k/t)}\sum_{n=0}^{\infty}\left|\frac{\Delta\lambda_n}{\lambda_n\lambda_{n+1}}k(n, t)\right| \\ &+ \sum_{n=0}^{\infty}\left|\frac{\Delta\lambda_n}{\lambda_n\lambda_{n+1}}\sum_{\nu=0}^{n}\frac{\lambda_\nu}{(\nu+1)}\int_0^t \frac{\sin(\nu+1)u}{ug(k/u)}du\right| \\ &+ \sum_{n=0}^{\infty}\left|\frac{\Delta\lambda_n}{\lambda_n\lambda_{n+1}}\sum_{\nu=0}^{n}\frac{\lambda_\nu}{(\nu+1)}\int_0^t \sin(\nu+1)u\frac{\partial}{\partial u}\left(\frac{1}{g(k/u)}\right)du\right| \\ &= \sum_1 + \sum_2 + \sum_3, \text{ say} . \end{aligned}$$

Now, we write, for $T = [t^{-1/(1-\alpha)}]$

$$\sum_1 = \sum_{n=0}^{T-1} + \sum_{n=T}^{\infty} = \sum_{1,1} + \sum_{1,2}, \text{ say} .$$

Since $\sin(\nu+1)t = O(1)$, we have

$$\begin{aligned} \sum_{1,1} &= O\left\{\frac{1}{g(k/t)}\sum_{n=0}^{T-1}\left|\frac{\Delta\lambda_n}{\lambda_n\lambda_{n+1}}\sum_{\nu=0}^{n}\frac{\lambda_\nu}{(\nu+1)}\right|\right\} \\ &= O\left\{\frac{1}{g(k/t)}\sum_{\nu=0}^{T-1}\frac{\lambda_\nu}{(\nu+1)}\sum_{n=\nu}^{T-1}\left(\frac{1}{\lambda_n} - \frac{1}{\lambda_{n+1}}\right)\right\} \\ &= O\left\{\frac{1}{g(k/t)}\sum_{\nu=0}^{T-1}\frac{1}{\nu+1}\right\} \\ &= O(1) , \end{aligned}$$

by (2.1), uniformly in $0 < t \leqq \pi$. And, by (3.1),

$$\begin{aligned} \sum_{1,2} &= O\left\{\frac{t^{-1}}{g(k/t)}\sum_{n=T}^{\infty}\left|\frac{\Delta\lambda_n}{(n+1)\lambda_{n+1}}\right|\right\} \\ &= O\left\{\frac{t^{-1}}{g(k/t)}\sum_{n=T}^{\infty}(n+1)^{\alpha-2}\right\} \\ &\qquad \text{(by (2.3))} \\ &= O\left\{\frac{t^{-1}}{g(k/t)}T^{\alpha-1}\right\} \\ &= O(1) , \end{aligned}$$

uniformly in $0 < t \leqq \pi$. And, by (3.2), we have

$$\sum_2 = O\left\{\sum_{n=0}^{\infty}\left|\frac{\Delta\lambda_n}{\lambda_n\lambda_{n+1}}\sum_{\nu=0}^{n}\frac{\lambda_\nu}{(\nu+1)g(\nu+1)}\right|\right\}$$

$$= O\left\{\sum_{\nu=0}^{\infty} \frac{\lambda_\nu}{(\nu+1)g(\nu+1)} \sum_{n=\nu}^{\infty}\left(\frac{1}{\lambda_n} - \frac{1}{\lambda_{n+1}}\right)\right\}$$
$$= O\left\{\sum_{\nu=0}^{\infty} \frac{1}{(\nu+1)g(\nu+1)}\right\}$$
$$= O(1) ,$$

by (2.5)(ii), uniformly in $0 < t \leqq \pi$. Also, by using (3.3), we get

$$\sum_3 = O(1) ,$$

uniformly in $0 < t \leqq \pi$.

This terminates the proof of Theorem 1.

6. In this section we give a criterion for the absolute convergence of Lebesgue-Fourier series at a point. First we consider the following corollary of Theorem 1.

COROLLARY. *If* (i) $\phi(t) \in BV(0, \pi)$ *and* (ii) $\Lambda(t)g(k/t) \in BV(0, \pi)$, *then* $\sum_{n=1}^{\infty} A_n(x) \in |R, \exp(n^\alpha), 1|(0 < \alpha < 1)$, *whenever* $g(k/t)$ *stands for any one of the following functions*:

$$\left(\log \frac{k}{t}\right)^{1+c}, \log \frac{k}{t}\left(\log_2 \frac{k}{t}\right)^{1+c}, \cdots, \log \frac{k}{t} \log_2 \frac{k}{t} \cdots \left(\log_p \frac{k}{t}\right)^{1+c}$$

where $\log_p k/t = \log\log_{p-1} k/t$, $\log_1 k/t = \log k/t$, $c > 0$, *and* k *is any suitable positive constant such that* $g(k/\pi) > 0$.

THEOREM 2. *If* (i) $\phi(t) \in BV(0, \pi)$, (ii) $\Lambda(t)g(k/t) \in BV(0, \pi)$ *and* (iii) $\{n^{1-\alpha}A_n(x)\} \in BV$ *for* $0 < \alpha < 1$, *then* $\sum_{n=1}^{\infty} |A_n(x)| < \infty$, *where* $g(k/t)$ *is as defined as in the above corollary.*

Proof of Theorem 2. Mohanty (7) observed that for $\lambda_n = e^{n^\alpha}$ sequences (i) $\{\lambda_n/\lambda_{n+1}\} \in BV$ and (ii) $\{n^{\alpha-1}\lambda_n\backslash(\lambda_n - \lambda_{n-1})\} \in BV$ and hence the conditions (ii) and (iii) of Lemma 2 are satisfied. Thus, in view of the above corollary, the proof follows by Lemma 2.

I feel greatly indebted to the referee for his valuable comments and suggestions.

PACIFIC JOURNAL OF MATHEMATICS

Mathematical papers intended for publication in the *Pacific Journal of Mathematics* should be in typed form or offset-reproduced, (not dittoed), double spaced with large margins. Underline Greek letters in red, German in green, and script in blue. The first paragraph or two must be capable of being used separately as a synopsis of the entire paper. The editorial "we" must not be used in the synopsis, and items of the bibliography should not be cited there unless absolutely necessary, in which case they must be identified by author and Journal, rather than by item number. Manuscripts, in duplicate if possible, may be sent to any one of the four editors. Please classify according to the scheme of Math. Rev. Index to Vol. **39**. All other communications to the editors should be addressed to the managing editor, Richard Arens, University of California, Los Angeles, California, 90024.

50 reprints are provided free for each article; additional copies may be obtained at cost in multiples of 50.

The *Pacific Journal of Mathematics* is published monthly. Effective with Volume 16 the price per volume (3 numbers) is $8.00; single issues, $3.00. Special price for current issues to individual faculty members of supporting institutions and to individual members of the American Mathematical Society: $4.00 per volume; single issues $1.50. Back numbers are available.

Subscriptions, orders for back numbers, and changes of address should be sent to Pacific Journal of Mathematics, 103 Highland Boulevard, Berkeley, California, 94708.
