**ON THE EXISTENCE QUESTION FOR A FAMILY OF
PRODUCTS**

GARY ALLEN GISLASON

ON THE EXISTENCE QUESTION FOR A FAMILY OF PRODUCTS

GARY A. GISLASON

Let X be a topological space and let P and Q be finite dimensional linear subspaces of $C(X)$. Since the set $PQ = \{pq: p \in P, q \in Q\}$ is a subset of a finite dimensional linear subspace of $C(X)$, existence of best approximations from PQ is assured if and only if PQ is closed. If $p \in P, q \in Q$, and $pq=0$ imply that $p=0$ or $q=0$, then PQ is shown to be closed. An example shows that PQ is not closed in general.

In an important paper by B. Boehm, [1], the problem of existence of best approximations from certain nonlinear families is discussed. One of these families is formed by taking products of elements of two finite dimensional linear subspaces of $C(X)$, where X is a topological space. In a seminar Professor H. Loeb pointed out an error in Boehm's existence proof for this family. Professor Loeb then posed the question whether the result was correct and if it was not to develop reasonable hypotheses to insure existence.

In this paper we consider these questions and show that Boehm's hypotheses have to be modified.

Throughout this paper X will denote a topological space and $C(X)$ the vector space of all bounded, continuous, real-valued functions defined on X . The symbol $\|\dots\|$ will represent the uniform norm defined on $C(X)$ by $\|f\| = \sup \{|f(x)|: x \in X\}$.

One question under consideration is that of existence of best approximations from the set

$$PQ = \{pq: p \in P \text{ and } q \in Q\}$$

where P and Q are finite dimensional linear subspaces of $C(X)$. (Here $(pq)(x) = p(x) \cdot q(x)$.) First of all it is easy to see that PQ is a subset of a finite dimensional linear subspace of $C(X)$. In fact, if $\{g_1, \dots, g_m\}$ is a basis of P and $\{h_1, \dots, h_n\}$ is a basis of Q then it is clear that PQ is contained in the linear space generated by the set of products of functions $\{g_i h_j: i = 1, \dots, m \text{ and } j = 1, \dots, n\}$. The dimension of this linear space is at most equal to mn . Now, it is known that best approximations exist from a subset of a finite dimensional linear subspace if and only if the subset is closed. But, as the following example shows, the set PQ is not closed in general.

EXAMPLE 1. Let $P = \{ag_1 + bg_2: a, b \text{ real}\}$ and $Q = \{ch_1 + dh_2: c, d \text{ real}\}$ be finite dimensional linear subspaces of $C[0, 5]$ with basis functions described by the graphs in Figure 1.

FIGURE 1.

Observe that

(1) $g_1 h_1 = h_1$, $g_2 h_1 = 0$, and $g_2 h_2 = g_2$ and that

(2) h_1 , $g_1 h_2$ and g_2 are linearly independent.

Now, consider the sequence $\{p_n q_n\}_{n=1}^{\infty}$ in PQ in which

$$p_n = g_1 + n g_2$$

and

$$q_n = h_1 + \frac{1}{n} h_2$$

for each n . By (1) it follows that

$$\begin{aligned} p_n q_n &= (g_1 + n g_2) \left(h_1 + \frac{1}{n} h_2 \right) \\ (*) \quad &= g_1 h_1 + \frac{1}{n} g_1 h_2 + n g_2 h_1 + g_2 h_2 \\ &= h_1 + \frac{1}{n} g_1 h_2 + g_2 \end{aligned}$$

for each n . Thus

$$p_n q_n \longrightarrow h_1 + g_2$$

as $n \rightarrow \infty$ so $h_1 + g_2$ is in the closure of PQ . If $h_1 + g_2$ is contained in PQ then there exist real coefficients a , b , c and d such that

$$(a g_1 + b g_2)(c h_1 + d h_2) = h_1 + g_2.$$

By (1) the above equation reduces to

$$a c h_1 + a d g_1 h_2 + b d g_2 = h_1 + g_2$$

and by (2) to the system

$$ac = 1$$

$$ad = 0$$

$$bd = 1$$

which has no solution. Thus $h_1 + g_2$ is not in PQ and PQ is not closed.

The above result shown that Boehm's Theorem 4, [1], is incorrect. The fact that $g_2 h_1 = 0$ even though $g_2 \neq 0$ and $h_1 \neq 0$ plays an important role in Example 1, as is apparent from (*). As it turns out, one modification to Boehm's hypotheses which implies that PQ is closed is to rule out the possibility of a product in PQ being zero when neither of the factors is zero.

THEOREM 1. *Let P and Q be finite dimensional linear subspaces of $C(X)$. If $p \in P$, $q \in Q$, and $pq = 0$ imply that $p = 0$ or $q = 0$ then PQ is closed.*

Proof. Let g be a function in the closure of PQ , and let $\{p_n q_n\}_{n=1}^{\infty}$ be a sequence in PQ such that

$$(3) \quad \|g - p_n q_n\| \longrightarrow 0$$

as $n \rightarrow \infty$. If $g = 0$ then certainly $g \in PQ$ since $0 \in P$ and $0 \in Q$. So, assume that $g \neq 0$. Then with no loss of generality it may be assumed that $p_n q_n \neq 0$ and that $\|p_n\| = 1$ for each n . Since closed and bounded subsets of finite dimensional linear spaces are compact, it suffices to show that a subsequence of the sequence $\{q_n\}_{n=1}^{\infty}$ is bounded. Assume the contrary. Then by going to subsequences, if necessary, and letting $n \rightarrow \infty$ it follows that

$$(4) \quad \frac{p_n q_n}{\|q_n\|} \longrightarrow 0.$$

By the preceding remark on compactness there exist nonzero functions $p \in P$ and $q \in Q$ such that

$$(5) \quad \frac{p_n q_n}{\|q_n\|} \longrightarrow pq$$

by going to further subsequences, if necessary, and letting $n \rightarrow \infty$. But (4) implies that $pq = 0$ which is a contradiction.

Clearly, in Theorem 1, $C(X)$ can be replaced by any real or complex normed algebra.

A counter example to Boehm's Theorem 5, [1], exists using ordinary polynomials and corresponding rational functions.

In a forthcoming paper we will discuss further the existence problem and also the characterization question for this setting.

The Supporting Institutions listed above contribute to the cost of publication of this Journal, but they are not owners or publishers and have no responsibility for its content or policies.

Mathematical papers intended for publication in the *Pacific Journal of Mathematics* should be in typed form or offset-reproduced, (not dittoed), double spaced with large margins. Underline Greek letters in red, German in green, and script in blue. The first paragraph or two must be capable of being used separately as a synopsis of the entire paper. The editorial "we" must not be used in the synopsis, and items of the bibliography should not be cited there unless absolutely necessary, in which case they must be identified by author and Journal, rather than by item number. Manuscripts, in duplicate if possible, may be sent to any one of the four editors. Please classify according to the scheme of Math. Rev. Index to Vol. **39**. All other communications to the editors should be addressed to the managing editor, Richard Arens, University of California, Los Angeles, California, 90024.

50 reprints are provided free for each article; additional copies may be obtained at cost in multiples of 50.

The *Pacific Journal of Mathematics* is published monthly. Effective with Volume 16 the price per volume (3 numbers) is \$8.00; single issues, \$3.00. Special price for current issues to individual faculty members of supporting institutions and to individual members of the American Mathematical Society: \$4.00 per volume; single issues \$1.50. Back numbers are available.

Subscriptions, orders for back numbers, and changes of address should be sent to Pacific Journal of Mathematics, 103 Highland Boulevard, Berkeley, California, 94708.
