**A NOTE ON ANNIHILATOR IDEALS OF COMPLEX BORDISM
CLASSES**

LARRY SMITH

A NOTE ON ANNIHILATOR IDEALS OF COMPLEX BORDISM CLASSES

LARRY SMITH

Recent studies of the complex bordism homology theory $\mathcal{Q}_*^U(\)$ have shown that for a finite complex X the integer $\text{hom-dim } {}_{\rho_*^U} \mathcal{Q}_*^U(X)$ provides a useful numerical invariant measuring certain types of complexity in X . Associated to an element $\alpha \in \mathcal{Q}_*^U(X)$ one has the annihilator ideal $A(\alpha) \subset \mathcal{Q}_*^U$. Numerous relations between $A(\alpha)$ and $\text{hom-dim } {}_{\rho_*^U} \mathcal{Q}_*^U(X)$ are known. In attempting to deal with these invariants it is of course useful to study special cases, and families of special cases. In this note we study the annihilator ideal of the canonical element $\sigma \in {}_{2N}^U \mathcal{Q}(X)$ where X is a complex of the form

$$S^{2N} \mathbf{U}_p e^{2N+1} \mathbf{U} e^{2N+2n_1-1} \mathbf{U} \dots \mathbf{U} e^{2N+2n_k-1}$$

and $N \gg n_1, \dots, n_k > 1$, and p an odd prime. We show that $A(\sigma) \ni [V^{2p^2-2}], \dots, [V^{2p^3-2}], \dots$, where $[V^{2p^s-2}] \in \mathcal{Q}_{2p^s-2}^U$ is a Milnor manifold for the prime p . This provides another piece of evidence that for such a complex X , $\text{hom-dim } {}_{\rho_*^U} \mathcal{Q}_*^U(X)$ is 1 or 2.

In [9], [11] and [12] the study of the annihilator ideal of the canonical class $\alpha \in \widetilde{\mathcal{Q}}_0^U(X)$ in a stable complex X of the form

$$X = S^0 \mathbf{U}_p e^1 \mathbf{U}_f e^{2n-1}$$

played a crucial role in the applications of [9] and [11] to the stable homotopy of spheres. In the closing remarks of [4] it was suggested that more generally for a stable complex of the form (where p is an odd prime)

$$Y = S^0 \mathbf{U}_p e^1 \mathbf{U}_{f_1} e^{2n_1-1} \dots \mathbf{U}_{f_k} e^{2n_k-1}$$

the annihilator ideal of the canonical class $\alpha \in \widetilde{\mathcal{Q}}_0^U(Y)$ had the form $(p, [CP(p-1)]^t)$ for some integer t , and that $\text{hom-dim } {}_{\rho_*^U} \mathcal{Q}_*^U(Y) \leq 2$. Our objective in this note is to make the following elementary contribution to these matters.

THEOREM. *Let Y be a stable complex of the form*

$$S^0 \mathbf{U}_p e^1 \mathbf{U}_{f_1} e^{2n_1-1} \mathbf{U}_{f_2} e^{2n_2-1} \dots \mathbf{U}_{f_k} e^{2n_k-1}$$

where p is odd prime. Let $\sigma \in \widetilde{\mathcal{Q}}_0^U(Y)$ denote the canonical class. Then

$$[V^{2p^s-2}] \notin A(\sigma)$$

for any $s > 1$, where $A(\sigma) \subset \Omega_*^U$ denotes the annihilator ideal of σ , and $[V^{2p^s-2}] \in \Omega_{2p^s-2}^U$ is a Milnor manifold for the prime p .

REMARK. An easy computation using Landweber-Novikov operations [1] [2] [5] [7] shows, for any stably spherical bordism element $\sigma \in \tilde{\Omega}_*^U(X)$ of additive order p , on a complex X , that

$$A(\sigma) \subset (p, [V^{2p-2}], [V^{2p^2-2}], \dots).$$

It is therefore not unreasonable to ask if some particular Milnor manifold $[V^{2p^s-2}]$ belongs to $A(\sigma)$.

The proof of this result follows closely the developments of [3] [4] [10]. The fundamental fact that we shall use is implicit in both [3] and [10] and may be stated as follows:

PROPOSITION. Let X be a finite complex and suppose that $\sigma \in \Omega_*^U(X)$ is a stably spherical class and satisfies the following conditions

- (1) $p\sigma = 0$, p a prime
- (2) $\mu_p(\sigma) \neq 0 \in \tilde{H}_*(X; Z_p)$ where μ_p is the composite

$$\mu_p: \tilde{\Omega}_*^U(X) \longrightarrow \tilde{H}_*(X; Z) \xrightarrow{\rho} \tilde{H}_*(X; Z_p)$$
 of the Thom homomorphism μ and reduction mod p ρ .

If $[V^{2p^s-2}] \in A(\sigma)$ then

$$S_i \beta u \neq 0 \in \tilde{H}^{n+2p^s-1}(X; Z_p)$$

where

$$\begin{array}{l} n = \text{deg } \sigma \\ u \in \tilde{H}^n(X; Z_p) \text{ is dual to } \mu_p(\sigma) \\ \beta \in \mathcal{A}(p) \text{ the Bockstein} \\ S_i \in \mathcal{A}(p) \text{ the primitive element of degree } 2p^i - 2. \end{array} \left\{ \begin{array}{l} \mathcal{A}(p) \text{ the mod} \\ p \text{ Steenrod} \\ \text{algebra.} \end{array} \right.$$

The proof of the preceding proposition may be deduced directly from [10; 1.2] as in § 2 of [10] or [3; 2.4].

Proof of Theorem. Suppose to the contrary that $[V^{2p^s-2}] \in A(\sigma)$ for some $s > 1$.

Let us denote by s_α , $\alpha = (\alpha_1, \dots)$ the Landweber-Novikov operation corresponding to the sequence α . (See [1] [2] [5] [7] or [11] for information about Landweber-Novikov operations). The following formula for the action of the Landweber-Novikov operations on Ω_*^U may be found in [11; 2.1] (and the succeeding remark):

$$s_{p^i, p^{s-1}, \dots, p^{s-2}} [V^{2p^s-2}] \equiv [V^{2p^{s-1}-2}] \text{ mod } p.$$

Applying the Cartan formula to the fact that σ is a spherical class we obtain:

$$\begin{aligned} [V^{2p^s-1-2}] \sigma &= (s_{p^s-1-p^{s-2}} [V^{2p^s-2}]) \sigma && \text{(Cartan formula)} \\ &= s_{p^s-1-p^{s-2}} ([V^{2p^s-2}] \sigma) \\ &= s_{p^s-1-p^{s-2}} (0) = 0 . \end{aligned}$$

Hence $[V^{2p^s-1-2}] \in A(\sigma)$. In this way we see that (recall we may choose $[V^{2p-2}] = [CP(p-1)]$).

$$p, [V^{2p-2}], \dots, [V^{2p^s-2}] \in A(\sigma) .$$

Note next that

$$\tilde{H}^i(Y; Z_p) \cong \begin{cases} Z & i = 0, 1, 2n_1-1, \dots, 2n_k-1 \\ 0 & \text{otherwise.} \end{cases}$$

For $i = 0, 1, 2n_1-1, \dots, 2n_k-1$, let $e_i \in \tilde{H}^i(Y; Z_p)$ denote a nonzero class. Note that we may choose $e_1 = \beta e_0$.

Applying the preceding proposition to the fact that

$$[CP(p-1)] \in A(\sigma)$$

we conclude that (recall $S_1 = P^1$)

$$P^1 \beta e_0 \neq 0 \in \tilde{H}^{2p-1}(Y; Z_p) .$$

Hence we may assume that $n_i = p$ and

$$e_{2p-1} = e_{2n_i-1} = P^1 \beta e_0 .$$

Next apply the preceding proposition to the fact that $[V^{2p^2-2}] \in A(\sigma)$ to conclude that

$$S_2 \beta e_0 \neq 0 \in H^{2p^2-1}(Y; Z_p) .$$

Recall that

$$S_2 = P^p P^1 - P^1 P^p .$$

Thus

$$P^p P^1 \beta e_0 - P^1 P^p \beta e_0 \neq 0 \in \tilde{H}^{2p^2-1}(Y; Z_p) .$$

Recall now the following Adem relations:

$$\begin{aligned} P^1 P^p &= -P^{p+1} \\ P^1 \beta P^p &= P^{p+1} \beta = P^1 P^p \beta . \end{aligned}$$

Therefore

$$P^1 P^p \beta e_0 = P^1 \beta P^p e_0 .$$

But

$$P^p e_0 \in \tilde{H}^{2p(p-1)}(Y; Z_p) = 0$$

and hence

$$P^1 P^p \beta e_0 = 0 .$$

Therefore we conclude that

$$P^p P^1 \beta e_0 \neq 0 \in \tilde{H}^{2p^2-1}(Y; Z_p) .$$

Next we propose to apply the factorization theorem of [6], [8] to deduce a contradiction. Consider therefore

$$P^1 P^1 \beta e_0 .$$

Recall the Adem relations

$$\begin{aligned} P^1 P^1 &= 2P^2 \\ P^2 \beta - \beta P^2 &= \beta P^1 P^1 - P^1 \beta P^1 . \end{aligned}$$

We have therefore

$$P^1 P^1 \beta e_0 = 2P^2 \beta e_0 = 2(\beta P^2 e_0 + \beta P^1 P^1 e_0 - P^1 \beta P^1 e_0) .$$

Now note that

$$\begin{aligned} P^2 e_0 &= 0 \\ P^1 e_0 &= 0 \end{aligned}$$

for dimensional reasons. Therefore

$$P^1 P^1 \beta e_0 = 2(0) = 0 .$$

The class $P^1 \beta e_0 \in \tilde{H}^{2p-1}(Y; Z_p)$ therefore satisfies

$$\begin{aligned} P^1(P^1 \beta e_0) &= 0 \\ \beta(P^1 \beta e_0) &= 0 \end{aligned}$$

(the latter from dimensional considerations). We may therefore apply the formula of [6] [8] to conclude that

$$P^p P^1 \beta e_0 = \beta \Lambda(P^1 \beta e_0) + 2P^{p-2} \mathcal{R}(P^1 \beta e_0)$$

modulo a suitable indeterminacy, where Λ and \mathcal{R} are secondary operations of degree $2p(p-1)-1$ and $4(p-1)$ respectively. Note that

$$\Lambda P^1 \beta e_0 \in \tilde{H}^{2p^2-2}(Y; Z_p) = 0$$

and hence

$$P^p P^1 \beta e_0 = 2P^{p-2} \mathcal{R} P^1 \beta e_0$$

modulo a suitable indeterminacy. And so it remains for us to eliminate the possibility that

$$P^{p-2} \mathcal{R} P^2 \beta e_0 \neq 0 .$$

This will require a careful analysis of the cell structure of Y thru dimensions $6p - 6$. Recall that

$$Y = S^0 \bigcup_p e^1 \dots .$$

Let $M = S^0 \bigcup_p e^1$. It follows from [14] that (N. B. it is necessary to divide into two cases, according to $p > 3$ or $p = 3$)

$$\pi_i^s(M) = \begin{cases} Z_p: i = 0, 2p - 3, 2p - 2, 4p - 5, 4p - 4, 6p - 7 \text{ or } 6p - 6 \\ 0: \text{ otherwise for } 0 \leq i \leq 6p - 6 . \end{cases}$$

A stable map

$$\alpha: S^{2p-2} \longrightarrow M$$

represents a nonzero element of $\pi_{2p-2}^s(M)$ iff

$$P^1 \beta: \tilde{H}^0(M \bigcup_\alpha e^{2p-1}; Z_p) \longrightarrow \tilde{H}^{2p-1}(M \bigcup_\alpha e^{2p-1}; Z_p)$$

is an isomorphism. Thus from the preceding analysis of the fact that $[CP(p - 1)] = [V^{2p-2}] \in A(\sigma)$ we find

$$Y = S^0 \bigcup_p e^1 \bigcup_\alpha e^{2p-1} \dots$$

where $[\alpha] \in \pi_{2p-2}^s(S^0 \bigcup_p e^1)$ is a generator. Next we form the cofibration

$$S^{2p-2} \xrightarrow{\alpha} M \xrightarrow{q} N$$

defining N as $S^0 \bigcup_p e^1 \bigcup_\alpha e^{2p-1}$. Note that

$$\pi_{2p-2}^s(N) = 0$$

and therefore the $2p-2$ skeleton of Y has the form

$$N \vee (S^{2p-1} \vee \dots \vee S^{2p-1}) .$$

We propose now to calculate the homotopy of N in low dimensions. From the definition of N we obtain an exact sequence

$$\dots \pi_i^s(S^{2p-2}) \xrightarrow{\alpha_*} \pi_i^s(M) \xrightarrow{q_*} \pi_i^s(N) \xrightarrow{\partial_*} \pi_{i-2}^s(S^{2p-2}) \dots .$$

Consulting [14] and the little table of the homotopy of M above we see that only a few values of i lead to p -primary information. The first such section is:

$$\begin{aligned} \longrightarrow \pi_{4p-4}^s(S^{2p-2}) &\xrightarrow{\alpha_*} \pi_{4p-4}^s(M) \xrightarrow{q_*} \pi_{4p-4}^s(N) \xrightarrow{\partial_*} \pi_{4p-5}^s(S^{2p-2}) \\ &\xrightarrow{\alpha_*} \pi_{4p-5}^s(M) \longrightarrow \pi_{4p-5}^s(N) \longrightarrow \dots . \end{aligned}$$

Now note that

$$\alpha_* : \pi_{4p-5}^s(S^{2p-2}) \longrightarrow \pi_{4p-5}^s(M)$$

is an isomorphism on the p -components which are Z_p . Thus our sequence divides into

$$\begin{aligned} 0 &\longrightarrow \pi_{4p-4}^s(M) \xrightarrow{q_*} \pi_{4p-4}^s(N) \longrightarrow 0 \\ 0 &\longrightarrow \pi_{4p-5}^s(S^{2p-2}) \longrightarrow \pi_{4p-5}^s(M) \longrightarrow 0 \\ 0 &\longrightarrow \pi_{4p-5}^s(N) \longrightarrow \pi_{4p-6}^s(S^{2p-2}) = 0 . \end{aligned}$$

We thus find that

$$\pi_i^s(N) \cong \begin{cases} Z_p: i = 4p-4 \\ \text{a group of order prime to } p: 2p-1 < i < 4p-4. \end{cases}$$

It will be important to remember that the generator of $\pi_{4p-4}^s(N)$ comes from $\pi_{4p-4}^s(M)$. Denote this generator by β . In a similar manner we find that

$$\pi_i^s(N) \cong \begin{cases} Z_p: i = 6p-6 \\ \text{a group of order prime to } p: 4p-4 \leq i \leq 6p-6, \end{cases}$$

and the generator of $\pi_{6p-6}^s(N)$ comes from $\pi_{6p-6}^s(M)$. Denote this generator by γ . Observe that since β and γ pull off the top cell of N that

$$P^1: H^{2p-1}(N\mathbf{U}_\beta e^{4p-3}; Z_p) \longrightarrow H^{4p-3}(N\mathbf{U}_\beta e^{4p-3}; Z_p)$$

and

$$\mathcal{R}: H^{2p-1}(N\mathbf{U}_\gamma e^{6p-5}; Z_p) \longrightarrow H^{6p-5}(N\mathbf{U}_\gamma e^{4p-3}; Z_p)$$

are zero. The first of these shows that

$$\mathcal{R}: H^{2p-1}(e^{6p-5} \mathbf{U}_\gamma N \mathbf{U}_\beta e^{4p-3}; Z_p) \longrightarrow H^{6p-5}(e^{2p-5} \mathbf{U}_\gamma N \mathbf{U}_\beta e^{4p-3}; Z_p)$$

is again defined but is still zero, modulo zero. (N.B. The indeterminacy of the operation \mathcal{R} in the sum of the images of the operations $2P^1\beta - \beta P^1$ and P^2 , which vanish for $e^{6p-5} \mathbf{U}_\gamma N \mathbf{U}_\beta e^{4p-3}$ for dimensional reasons).

Let us denote by

$$r: N \vee (S^{2p-1} \vee \dots \vee S^{2p-1}) \longrightarrow M$$

the natural map. The analysis preceding shows that thru the $6p-6$ skeleton Y^{6p-6} , of Y , there is a map

$$p: Y^{6p-6} \longrightarrow \begin{cases} N \\ N \mathbf{U}_\beta e^{4p-3} \\ N \mathbf{U}_\gamma e^{6p-5} \\ e^{6p-5} \mathbf{U}_\gamma N \mathbf{U}_\beta e^{4p-3} \end{cases}$$

inducing an isomorphism of Z_p cohomology thru dimensions 0 and 1 and an injections thru dimensions $6p-6$. The particular space on the right depending on the cells of Y occuring.

Therefore $\mathcal{R} P^1 \beta e_0 \neq 0 \in H^{6p-5}(Y; Z_p)$ iff the corresponding result is true for one of the spaces $N, N \mathbf{U}_\beta e^{4p-3}, N \mathbf{U}_\gamma e^{6p-5}, e^{6p-5} \mathbf{U}_\gamma N \mathbf{U}_\beta e^{4p-3}$. However, in constructing these spaces we carefully checked that $\mathcal{R} P^1 \beta e_0 = 0$ modulo 0. Therefore

$$\mathcal{R} P^1 \beta e_0 = 0 \in H^{6p-5}(Y; Z_p)$$

modulo 0 and hence

$$P^p P^1 \beta e_0 = P^{p-2} \mathcal{R} P^1 \beta e_0 = 0 \in H^{2p^2-1}(Y; Z_p)$$

modulo 0 from which we conclude $[V^{2p^2-2}] \notin A(\sigma)$. But as we saw at the beginning of the proof this is contrary to the assumption that $[V^{2p^s-2}] \in A(\sigma)$ for some $s > 1$ and the the theorem is established. **

Question. Does there exist a simple Adem type relation that would show $\mathcal{R} P^1 \beta e_0 = 0$ modulo 0 in $H^{6p-5}(Y; Z^p)$ without going through the cell by cell analysis above?

COROLLARY. *Let Y be a stable complex of the form*

$$Y = S^0 \mathbf{U}_p e^1 \mathbf{U}_{f_1} e^{2n_1-1} \dots \mathbf{U}_{f_k} e^{2n_k-1}$$

where p is an odd prime. Let $\sigma \in \Omega_0^u(Y)$ denote the canonical class. Then for each integer $s > 1$ the class $[V^{2p^s-2}] \sigma$ is not stably spherical, that is, for $s > 1$

$$[V^{2p^s-2}] \sigma \notin \text{Im} \{ \widetilde{\Omega}_*^f(Y) \longrightarrow \widetilde{\Omega}_*^u(Y) \} . **$$

Mathematical papers intended for publication in the *Pacific Journal of Mathematics* should be in typed form or offset-reproduced, (not dittoed), double spaced with large margins. Underline Greek letters in red, German in green, and script in blue. The first paragraph or two must be capable of being used separately as a synopsis of the entire paper. The editorial "we" must not be used in the synopsis, and items of the bibliography should not be cited there unless absolutely necessary, in which case they must be identified by author and Journal, rather than by item number. Manuscripts, in duplicate if possible, may be sent to any one of the four editors. Please classify according to the scheme of Math. Rev. Index to Vol. 39. All other communications to the editors should be addressed to the managing editor, Richard Arens, University of California, Los Angeles, California, 90024.

50 reprints are provided free for each article; additional copies may be obtained at cost in multiples of 50.

The *Pacific Journal of Mathematics* is published monthly. Effective with Volume 16 the price per volume (3 numbers) is \$8.00; single issues, \$3.00. Special price for current issues to individual faculty members of supporting institutions and to individual members of the American Mathematical Society: \$4.00 per volume; single issues \$1.50. Back numbers are available.

Subscriptions, orders for back numbers, and changes of address should be sent to Pacific Journal of Mathematics, 103 Highland Boulevard, Berkeley, California, 94708.
