**TWO REMARKS ON ELEMENTARY EMBEDDINGS OF THE
UNIVERSE**

THOMAS J. JECH

TWO REMARKS ON ELEMENTARY EMBEDDINGS OF THE UNIVERSE

THOMAS J. JECH

The paper contains the following two observations: 1. The existence of the least submodel which admits a given elementary embedding j of the universe. 2. A necessary and sufficient condition on a complete Boolean algebra B that the Cohen extension V^B admits j .

A function j defined on the universe V is an *elementary embedding of the universe* if there is a submodel M such that for any formula φ ,

$$(*) \quad \forall x_1, \dots, x_n [\varphi(x_1, \dots, x_n) \leftrightarrow M \models \varphi(jx_1, \dots, jx_n)].$$

Let j be an elementary embedding of the universe. If N is a submodel, let $j_N = j|N$ be the restriction of j to N . N *admits* j if

$$(**) \quad N \models j_N \text{ is an elementary embedding of the universe.}$$

If B is a complete Boolean algebra, let V^B be the Cohen extension of V by B . V^B *admits* j if

$$(***) \quad V^B \models \text{there exists an elementary embedding } i \text{ of the universe such that } i \cong j$$

THEOREM 1. *There is a submodel $L(j)$ which is the least submodel which admits j .¹*

THEOREM 2. *The Cohen extension V^B admits j if and only if the identity mapping on $j''B$ can be extended to a $j(V)$ – complete homomorphism of $j(B)$ onto $j''B$.*

Before giving the proof, we have a few remarks. The underlying set theory is the axiomatic theory BG of sets and classes of Bernays and Gödel [1]. The formula φ in (*) is supposed to have only set variables. However, if for any class C we let $j(C) = \bigcup_{\alpha \in On} j(C \cap V_\alpha)$, then (*) holds also for formulas having free class variables (“normal formulas” of [1].) Incidentally, “ j is an elementary embedding of the universe” is expressible in the language of BG (viz.: j is an ε -isomorphism and $\forall C_1 \forall C_2 [\mathcal{F}_i(jC_1, jC_2) = j(\mathcal{F}_i(C_1, C_2))]$ where \mathcal{F}_i are the Gödel operations).

¹ This was observed independently by K. Hrbáček, giving a different proof.

A *submodel* M is a transitive class containing all ordinals which is a model of GB ; the classes of M are all those subclasses C of M which satisfy the condition $\forall \alpha (C \cap V_\alpha \in M)$. The submodel M in (*) is unique and $M = j(V)$. It is a known fact that if j is not the identity then there exists a measurable cardinal. And, as proved recently by Kunen [2], $j(V) \neq V$. On the other hand, if there exists a measurable cardinal, then there exists a nontrivial elementary of the universe (cf. Scott [6]).

The notion $L(j)$ differs somewhat from the notion of relative constructibility, introduced by Lévy [4]; in general, $L(j) \cong L[j]$.

A homomorphism is C -complete, if it preserves all Boolean sums $\sum_{i \in I} u_i$ where $\{u_i: i \in I\} \in C$. As usual, $j''B$ is the algebra $\{j(u): u \in B\}$; $j(B)$ is an algebra, $j(B) \cong j''B$, and $j(B)$ is not necessarily complete (although jV -complete).

A similar observation as our Theorem 2 was used recently by J. Silver in his result about extendable cardinals.

As a corollary of Theorem 2, we get the following theorem of Lévy and Solovay [5]: *If κ is measurable and $|B| < \kappa$, then κ is measurable in V^B .*²

Let j be a fixed elementary embedding of the universe. First we prove Theorem 1.

Let M be a submodel.

LEMMA 1. *If j_M is a class of M then M admits j .*

Proof. We must show that for any formula φ ,

$$(\forall \vec{x} \in M) M \models (\varphi(\vec{x}) \rightarrow jM \models \varphi(j\vec{x})).$$

If $M \models \varphi(\vec{x})$, then since $M \models \varphi(\vec{x})$ is a normal formula, we have $jV \models (jM \models \varphi(j\vec{x}))$. However, \models is absolute, so that $M \models (jM \models \varphi(j\vec{x}))$.

LEMMA 2. *If $j \cap M$ is a class of M and if M is closed under j (i.e., $j''M \subseteq M$), then M admits j .*

Proof. It suffices to show that j_M is a class of M . Obviously, $j_M \cap M = j \cap M$, and because M is closed under j , we have $j_M \subseteq M$, and $j_M = j_M \cap M = j \cap M$.

Now we define the model $L(j)$:

- (i) $L_0(j) = 0$,
- (ii) $L_\alpha(j) = \bigcup_{\beta < \alpha} L_\beta(j)$ if α is a limit ordinal,

² An example of models which are not mild extensions but still admit j are the models constructed by Kunen and Paris in [3].

- (iii) $L_{\alpha+1}(j) = \text{Def} \langle L_\alpha(j), \varepsilon, j \cap L_\alpha(j) \rangle$ if α is even,
- (iv) $L_{\alpha+1}(j) = L_\alpha(j) \cup [j''L_\alpha(j) \cap \mathcal{P}(L_\alpha(j))]$ if α is odd,
- (v) $L(j) = \bigcup_{\alpha \in On} L_\alpha(j)$.

(iii) means that $L_{\alpha+1}(j)$ consists of all subsets of $L_\alpha(j)$ which are definable in $L_\alpha(j)$ from $j \cap L_\alpha(j)$. $\mathcal{P}(L_\alpha(j))$ is the set of all subset of $L_\alpha(j)$.

By standard methods it follows that $L_\alpha(j)$ is a submodel. That $L_\alpha(j)$ satisfies the axiom of choice is proved in Lemma 4.

LEMMA 3. $i = j \cap L(j)$ is a class of $L(j)$ and

$$L(j) = L(i) = L^{L(j)}(i).$$

Proof. By induction on α , we prove

$$L_\alpha(j) = L_\alpha(i) = L_\alpha^{L(j)}(i).$$

If α is a limit ordinal or $\alpha = \beta + 1$ with β even, then the proof is standard. Let β be odd:

$$\begin{aligned} x \in L_{\beta+1}(j) &\leftrightarrow x \in L_\beta(j) \vee [x \subseteq L_\beta(j) \wedge x \in L(j) \wedge (\exists y \in L_\beta(j))[x = j(y)]] \\ &\leftrightarrow x \in L_\beta(i) \vee [x \subseteq L_\beta(i) \wedge (\exists y \in L_\beta(i))[x = i(y)]] \\ &\leftrightarrow x \in L_{\beta+1}(i) \\ &\leftrightarrow x \in L_{\beta+1}^{L(j)}(i). \end{aligned}$$

COROLLARY. $L(j) \models V = L(i)$.

LEMMA 4. $L(j) \models \text{Axiom of Choice}$.

Proof. If $V = L(i)$ then there is a well ordering of the universe, definable from i ; hence $L(j) \models \text{Axiom of Choice}$.

LEMMA 5. $L(j)$ is closed under j .

Proof. (a) If $X \subseteq On$ and $X \in L(j)$ then there exists α such that $X \in L_\alpha(j)$ and $j(X) \subseteq \alpha \subseteq L_\alpha(j)$; hence $j(X) \in L_{\alpha+1}(j)$ and so $j(X) \in L(j)$. Similarly, if $X \subseteq On \times On$.

(b) If $X \in L(j)$ is arbitrary, then since $L(j) \models AC$, there exists a well founded relation $R \in L(j)$ on ordinals which is isomorphic to $TC(\{X\})$, the transitive closure of $\{X\}$. Hence $j(TC(\{X\})) = TC(\{jX\})$ is isomorphic to $j(R)$ which is well founded and by (a), $jR \in L(j)$; thus $j(X) \in L(j)$.

LEMMA 6. *If M admits j then*

$$L(j) = L^M(j \cap M) \cong M.$$

Proof. Same as of Lemma 3.

Now, Theorem 1 follows.

Let B be a complete Boolean algebra. The *Cohen extension* V^B is the Boolean-valued model of Scott [7] or Vopěnka [8]. There is a natural embedding $x \mapsto \check{x}$ of V into V^B and $C \mapsto \check{C}$ can be defined also for classes, in a natural way (in (**), we should rather write $i \cong \check{j}$). More generally, if M is a submodel satisfying the axiom of choice and if $B \in M$ is an M -complete Boolean algebra then M^B is the Cohen extension of M by B .

LEMMA 7. *The condition in Theorem 2 is necessary.*

Proof. Let i be such that

- (1) $V^B \models i$ is an elementary embedding of the universe and $i \cong \check{j}$.

Let G be the canonical generic ultrafilter on \check{B} , i.e.,

- (2) $G \in V^{(B)}$, $\text{dom}(G) = \{\check{u} : u \in B\}$,
 $G(\check{u}) = u$ for all $u \in B$.

From (1) it follows that

- (3) $V^B \models i(G)$ is an $i(\check{V})$ -complete ultrafilter on $i(\check{B})$, i.e.,
 (4) $V^B \models i(G)$ is a $(jV)^\vee$ -complete ultrafilter on $(jB)^\vee$.

Let f be the following function from $j(B)$ into B :

$$f(v) = \llbracket \check{v} \in i(G) \rrbracket.$$

By (4), f is a $j(V)$ -complete homomorphism of $j(B)$ into B and for all $u \in B$, $f(ju) = \llbracket (ju)^\vee \in i(G) \rrbracket = \llbracket i(\check{u}) \in i(G) \rrbracket = \llbracket \check{u} \in G \rrbracket = u$. If we let $h = j \circ f$ then h is a $j(V)$ -complete homomorphism of $j(B)$ onto $j''B$ and $h|_{j''B}$ is the identity.

LEMMA 8. *The condition is sufficient.*

Proof. Let h be a $j(V)$ -complete homomorphism of $j(B)$ onto $j''B$ such that $h(ju) = ju$ for all $u \in B$. We are supposed to find i such that (1) holds. To simplify the considerations, assume that G is some V -complete ultrafilter on B and that $V[G]$ is the universe. (This is possible because

$$V^B \models \check{V}[G] \text{ is the universe,}$$

where G is the canonical generic ultrafilter defined in (2).)

Let $i(G) = h_{-1}(j''G)$. We have $i(G) \cong j''G$, and

$i(G)$ is a $j(V)$ -complete ultrafilter on $j(B)$.

Let $\pi_G: V^B \rightarrow V[G]$ be the G -interpretation of V^B :

$$\begin{aligned} \pi_G(0) &= 0, \\ \pi_G(x) &= \{\pi_G(y) : x(y) \in G\}. \end{aligned}$$

Since $j(B) \in j(V)$ is an $j(V)$ -complete Boolean algebra, $j(V)^{j(B)} = j(V^B)$ is the Cohen extension of $j(V)$ by $j(B)$; it follows from the definition of $i(G)$ that $i(G)$ is a $j(V)$ -complete ultrafilter on $j(B)$. Let $\pi_{iG}: (jV)^{j^B} \rightarrow (jV)[iG]$ be the $i(G)$ -interpretation of $(jV)^{j^B}$ and let

$$i(\pi_G x) = \pi_{iG}(jx), \text{ for all } x \in V^B.$$

Now we claim that i is a function, i is an elementary embedding of $V[G]$ into $(jV)[iG]$ and that $i \cong j$. To prove that, note that for any formula φ and for all $\vec{x} \in V^B$,

$$\llbracket \varphi(j\vec{x}) \rrbracket_{j^B}^V = j \llbracket \varphi(\vec{x}) \rrbracket_B^V;$$

This can be proved by induction on the rank of \vec{x} and on the complexity of φ . In particular, if $\pi_G x = \pi_G y$, then $\llbracket x = y \rrbracket_B^V \in G$, so that $\llbracket jx = jy \rrbracket_{j^B}^V \in j''G \subseteq i(G)$ and so $i(\pi_G x) = \pi_{iG}(jx) = \pi_{iG}(jy) = i(\pi_G y)$. Similarly, if $V[G] \models \varphi(\pi_G \vec{x})$, then $(jV)[iG] \models \varphi(i(\pi_G \vec{x}))$. If $x \in V$, then $i(x) = i(\pi_G \check{x}) = \pi_{iG}(j\check{x}) = j(x)$.

This completes the proof of Theorem 2.

The Supporting Institutions listed above contribute to the cost of publication of this Journal, but they are not owners or publishers and have no responsibility for its content or policies.

Mathematical papers intended for publication in the *Pacific Journal of Mathematics* should be in typed form or offset-reproduced, (not dittoed), double spaced with large margins. Underline Greek letters in red, German in green, and script in blue. The first paragraph or two must be capable of being used separately as a synopsis of the entire paper. The editorial "we" must not be used in the synopsis, and items of the bibliography should not be cited there unless absolutely necessary, in which case they must be identified by author and Journal, rather than by item number. Manuscripts, in duplicate if possible, may be sent to any one of the four editors. Please classify according to the scheme of Math. Rev. Index to Vol. 39. All other communications to the editors should be addressed to the managing editor, Richard Arens, University of California, Los Angeles, California, 90024.

50 reprints are provided free for each article; additional copies may be obtained at cost in multiples of 50.

The *Pacific Journal of Mathematics* is published monthly. Effective with Volume 16 the price per volume (3 numbers) is \$8.00; single issues, \$3.00. Special price for current issues to individual faculty members of supporting institutions and to individual members of the American Mathematical Society: \$4.00 per volume; single issues \$1.50. Back numbers are available.

Subscriptions, orders for back numbers, and changes of address should be sent to Pacific Journal of Mathematics, 103 Highland Boulevard, Berkeley, California, 94708.
