FOURIER-STIELTJES TRANSFORMS AND WEAKLY ALMOST PERIODIC FUNCTIONALS FOR COMPACT GROUPS

CHARLES F. DUNKL AND DONALD E. RAMIREZ

Let G be a compact group and H a closed subgroup. A function in the Fourier algebra of H can be extended to a function in the Fourier algebra of G without increase in norm and with an arbitrarily small increase in sup-norm. For G a compact Lie group, the space of Fourier-Stieltjes transforms is not dense in the space of weakly almost periodic functionals on the Fourier algebra of G .

We let G denote an infinite compact group and \hat{G} its dual. We use the notation of [1, Chapters 7 and 8], [2], and [3]. Recall $A(G)$ denotes the Fourier algebra of G (an algebra of continuous functions on G), and $\mathcal{L}^\infty(\hat{G})$ denotes its dual space under the pairing $\langle f, \phi \rangle$ ($f \in A(G)$, $\phi \in \mathcal{L}^\infty(\hat{G})$). Further, note $\mathcal{L}^\infty(\hat{G})$ is identified with the C^* -algebra of bounded operators on $L^2(G)$ commuting with right translation. The module action of $A(G)$ on $\mathcal{L}^\infty(\hat{G})$ is defined by the following: for $f \in A(G)$, $\phi \in \mathcal{L}^\infty(\hat{G})$, $f \cdot \phi \in \mathcal{L}^\infty(\hat{G})$ by $\langle g, f \cdot \phi \rangle = \langle fg, \phi \rangle$, $g \in A(G)$. Also $\|f \cdot \phi\|_\infty \leq \|f\|_A \|\phi\|_\infty$.

Let $\phi \in \mathcal{L}^\infty(\hat{G})$. We call ϕ a weakly almost periodic functional if and only if the map $f \mapsto f \cdot \phi$ from $A(G)$ to $\mathcal{L}^\infty(\hat{G})$ is a weakly compact operator. The space of all such is denoted by $W(\hat{G})$.

Let $M(G)$ denote the measure algebra of G . For $\mu \in M(G)$, the Fourier-Stieltjes transform of μ , $\mathcal{F}\mu$, is a matrix-valued function in $\mathcal{L}^\infty(\hat{G})$ defined for $\alpha \in \hat{G}$ by

$$\alpha \mapsto (\mathcal{F}\mu)_\alpha = \int_G T_\alpha(x^{-1}) d\mu(x) \quad (T_\alpha \in \alpha).$$

We denote the closure of $\mathcal{F}M(G)$ in $\mathcal{L}^\infty(\hat{G})$ by $\mathcal{M}(\hat{G})$. In [2], we showed that $W(\hat{G})$ is a closed subspace of $\mathcal{L}^\infty(\hat{G})$, and that $\mathcal{M}(\hat{G}) \subset W(\hat{G})$ with the inclusion proper when G is a direct product of an infinite collection of nontrivial compact groups. In this paper, we show the inclusion is proper for all compact Lie groups.

We first state a standard lemma.

LEMMA 1. *Let A, B be compact subsets of a topological group G . Suppose $AB \subset U$, U an open subset of G . Then there is an open neighborhood V of the identity e of G such that $AVB \subset U$.*

PROPOSITION 2. *Let G be a compact group and H a closed subgroup. Let W be an open subset of G with $H \cap W = \emptyset$. Then there is a continuous positive definite function p on G with $p(x) = 1$, $x \in H$, and $p(x) = 0$, $x \in W$. (Note $p \in A(G)$ and $\|p\|_A = 1$.)*

Proof. Let U be an open subset of G with $H \subset U$, and $U \cap W = \emptyset$. Choose V_1 an open neighborhood of e with $HV_1H \subset U$. Now let V be an open neighborhood of e with $VV \subset V_1$ and $V = V^{-1}$. Thus $HVVH \subset HV_1H \subset U$.

Let $p = (m_G(HV))^{-1} \chi_{HV} * \chi_{VH}$ (m_G is normalized Haar measure on G and χ_A denotes the characteristic function of A). Then $p(x) = (m_G(HV))^{-1} m_G(xHV \cap HV)$, $x \in G$. Thus for $x \in H$, $p(x) = 1$. If $p(x) \neq 0$, then $xHV \cap HV \neq \emptyset$, and so $x \in HVVH \subset U$.

THEOREM 3. *Let G be a compact group and H a closed subgroup. Let $f \in A(H)$ and $\varepsilon > 0$. Then there exists $g \in A(G)$, $\|g\|_A = \|f\|_A$, $g|_H = f$, and $\|g\|_\infty \leq \|f\|_\infty + \varepsilon$.*

Proof. Let h be an extension of f to G with $\|h\|_A = \|f\|_A$ (see [1, Chapter 8]). Let $V = \{x \in G: |h(x)| > \|f\|_\infty + \varepsilon\}$. Now let p be as in Proposition 2, and let $g = ph$.

We now state a characterization of $\mathcal{M}(\hat{G})$. The proof for abelian groups is in [1, Chapter 3]. The proof for nonabelian groups is analogous.

THEOREM 4. *Let G be a compact group and $\phi \in \mathcal{L}^\infty(\hat{G})$. For $\phi \in \mathcal{M}(\hat{G})$ it is necessary and sufficient that whenever $\{f_n\}$ is a sequence from $A(G)$ with $\|f_n\|_A \leq 1$ and $\|f_n\|_\infty \xrightarrow{n} 0$ we have $\langle f_n, \phi \rangle \xrightarrow{n} 0$.*

THEOREM 5. *Let G be a compact Lie group. Then $\mathcal{M}(\hat{G}) \neq W(\hat{G})$.*

Proof. Let H be a total subgroup of G ; that is, H is the circle group. Now $\mathcal{M}(\hat{H}) \neq W(\hat{H})$, (see [1, Chapter 4]).

Let π_1 denote the restriction map of $A(G)$ onto $A(H)$ and let $\hat{\pi}$ denote the adjoint map of $\mathcal{L}^\infty(\hat{H})$ into $\mathcal{L}^\infty(\hat{G})$. In [3], we showed that

$$\hat{\pi} \mathcal{M}(\hat{H}) \subset \mathcal{M}(\hat{G}) \text{ and } \hat{\pi} W(\hat{H}) \subset W(\hat{G}).$$

Let $\phi \in W(\hat{H}) \setminus \mathcal{M}(\hat{H})$. Now $\hat{\pi}\phi \in W(\hat{G})$ so we need only show that $\hat{\pi}\phi \notin \mathcal{M}(\hat{G})$. Since $\phi \notin \mathcal{M}(\hat{H})$, there is a sequence $\{f_n\} \subset A(H)$, $\|f_n\|_A \leq 1$, $\|f_n\|_\infty \xrightarrow{n} 0$ with $|\langle f_n, \phi \rangle| \geq \varepsilon$ (some $\varepsilon > 0$). Extend f_n to $g_n \in$

$A(G)$ by Theorem 3 with $\|g_n\|_A \leq 1$ and $\|g_n\|_\infty \xrightarrow{n} 0$. But $\langle g_n, \hat{\pi}\phi \rangle = \langle \pi_1 g_n, \phi \rangle = \langle f_n, \phi \rangle$, and so $\hat{\pi}\phi \notin \mathcal{M}(\hat{G})$.

REMARK. If a compact group G has a closed subgroup H with $\mathcal{M}(\hat{H}) \neq W(\hat{H})$, then $\mathcal{M}(\hat{G}) \neq W(\hat{G})$, (in particular, if G contains an infinite abelian subgroup). Indeed, it is an open question whether an infinite compact group always contains an infinite abelian subgroup.

COROLLARY 6. *Let G be a compact group with H a closed subgroup. Then*

$$\hat{\pi}(W(\hat{H}) \setminus \mathcal{M}(\hat{H})) \subset W(\hat{G}) \setminus \mathcal{M}(\hat{G}).$$

The Supporting Institutions listed above contribute to the cost of publication of this Journal, but they are not owners or publishers and have no responsibility for its content or policies.

Mathematical papers intended for publication in the *Pacific Journal of Mathematics* should be in typed form or offset-reproduced, (not dittoed), double spaced with large margins. Underline Greek letters in red, German in green, and script in blue. The first paragraph or two must be capable of being used separately as a synopsis of the entire paper. The editorial "we" must not be used in the synopsis, and items of the bibliography should not be cited there unless absolutely necessary, in which case they must be identified by author and Journal, rather than by item number. Manuscripts, in duplicate if possible, may be sent to any one of the four editors. Please classify according to the scheme of Math. Rev. Index to Vol. 39. All other communications to the editors should be addressed to the managing editor, Richard Arens, University of California, Los Angeles, California, 90024.

50 reprints are provided free for each article; additional copies may be obtained at cost in multiples of 50.

The *Pacific Journal of Mathematics* is published monthly. Effective with Volume 16 the price per volume (3 numbers) is \$8.00; single issues, \$3.00. Special price for current issues to individual faculty members of supporting institutions and to individual members of the American Mathematical Society: \$4.00 per volume; single issues \$1.50. Back numbers are available.

Subscriptions, orders for back numbers, and changes of address should be sent to Pacific Journal of Mathematics, 103 Highland Boulevard, Berkeley, California, 94708.
