**ON THE COUNTABLE UNION OF CELLULAR  
DECOMPOSITIONS OF  $n$ -MANIFOLDS**

WILLIAM L. VOXMAN

## ON THE COUNTABLE UNION OF CELLULAR DECOMPOSITIONS OF $n$ -MANIFOLDS

W. VOXMAN

**Suppose that  $G_1, G_2 \dots$  are cellular upper semicontinuous decompositions of an  $n$ -manifold with boundary  $M(n \neq 4)$  such that for  $i = 1, 2, \dots, M/G_i$  is homeomorphic to  $M$ . Let  $G$  be the decomposition of  $M$  obtained from the decomposition of  $G_i$  in the following manner. A set  $g$  belongs to  $G$  if and only if  $g$  is a nondegenerate element of some  $G_i$  or  $g$  is a point in  $M - (\bigcup_{i=1}^{\infty} H_{G_i}^*)$ . It will be shown that if the various decompositions fit together in a "continuous" manner and if  $G$  is an upper semicontinuous decomposition of  $M$ , then  $M/G$  is homeomorphic to  $M$ .**

Our principal result thus extends previous results obtained by the author ([6], [7]) and Lamoreaux [4], by removing the 0-dimensionality restriction in [6] or, alternatively, by eliminating the finiteness condition in [7]. Furthermore, with the aid of recent work of Siebenmann [5], generalizations to  $n$ -manifolds ( $n \neq 4$ ) may be made. As was observed in [7], some conditions must be imposed on the manner in which the decompositions are pieced together. The example described by Bing in [2] demonstrates that the continuity condition to be described below is a necessary one.

**Notation and terminology.** Suppose  $G$  is an upper semicontinuous decomposition of a topological space,  $X$ . Then  $X/G$  will denote the associated decomposition space,  $P$  will denote the natural projection map from  $X$  onto  $X/G$ , and  $H_G$  will denote the collection of nondegenerate elements of  $G$ . If  $U$  is an open subset of  $X$ , then  $U$  is said to be *saturated* (with respect to  $G$ ) in case  $U = P^{-1}[P[U]]$ . If  $\mathcal{Z}$  is a covering of a subset of  $X$ , then  $P[\mathcal{Z}] = \{P[U]: U \in \mathcal{Z}\}$ .

The statement that  $M$  is an  $n$ -manifold with boundary means that  $M$  is a separable metric space such that each point of  $M$  has a neighborhood which is an  $n$ -cell. If  $A$  is a subset of  $M$ , then  $A$  is *cellular* in  $M$  if there exists a sequence  $C_1, C_2, \dots$  of  $n$ -cells in  $M$  such that (1) for each positive integer  $i, C_{i+1} \subset \text{Interior } C_i$ , and (2)  $\bigcap_{i=1}^{\infty} C_i = A$ . If  $M$  is an  $n$ -manifold with boundary, the statement that  $G$  is *cellular decomposition* of  $M$  means that  $G$  is an upper semicontinuous decomposition of  $M$  and each nondegenerate element of  $G$  is a cellular subset of  $M$ .

If  $M$  is a metric space,  $A$  a subset of  $M$ , then  $S_\epsilon(A)$  denotes the  $\epsilon$ -neighborhood of  $A$  and  $\text{Cl } A$  denotes the closure of  $A$  in  $M$ . If  $K$

is a collection of subsets of  $M$ , then  $K^* = \bigcup\{k: k \in K\}$ . The word *map* will always be used to indicate a continuous function. If  $\mathcal{U}$  is a collection of subsets of  $M$  and  $A \subset M$ , then

$$\text{St}(A, \mathcal{U}) = \bigcup\{U \in \mathcal{U}: A \cap U \neq \emptyset\}.$$

The main result. The principal theorem will be proved by means of repeated applications of the Lemma which appears below. We say that a cellular decomposition  $G$  of a manifold  $M$  satisfies condition  $S$  if for each saturated open cover  $\mathcal{U}$  of  $H_G^*$ , there exists a closed map  $h$  from  $M$  onto  $M$  such that (1)  $G = \{h^{-1}(x): x \in M\}$ , (2) if  $x \in M - \mathcal{U}^*$ , then  $h(x) = x$ , and (3) for each  $g \in G$  and  $g \subset \mathcal{U}^*$ , there exists a  $U \in \mathcal{U}$  such that  $g \cup h(g) \subset U$ .

LEMMA 1. *Suppose  $G$  is a cellular decomposition of an  $n$ -manifold with boundary  $M(n \neq 4)$ . Then  $M/G$  is homeomorphic to  $M$  if and only if  $G$  satisfies condition  $S$ .*

*Proof.* Clearly if  $G$  satisfies condition  $S$ , then  $M/G$  is homeomorphic to  $M$ . Suppose now that  $M/G$  is homeomorphic to  $M$  and that  $\mathcal{U}$  is a saturated open cover of  $H_G^*$ . Without loss of generality we may assume that  $\mathcal{U}$  is locally finite. Suppose  $x \in \mathcal{U}^*$  and  $U_1, \dots, U_n$  are those sets in  $\mathcal{U}$  which contain  $x$ . Set

$$\varepsilon_x = \max\{d(P(x), M/G - P[U_1]), \dots, d(P(x), M/G - P[U_n])\}$$

and define  $f_1(x) = \varepsilon_x/2$ . Then  $f_1$  is a lower semicontinuous function from  $\mathcal{U}^*$  into  $(0, \infty)$ , and, hence, there exists a continuous map  $f_2$  from  $\mathcal{U}^*$  into  $(0, \infty)$  such that  $0 < f_2 < f_1$ . For  $x \in \mathcal{U}^*$ , define  $f_3(x)$  to be  $d(P(x), M/G - P[\mathcal{U}^*])$ , and finally define  $f(x)$  to be  $\min\{f_2(x), f_3(x)\}$ . Siebenman's projection approximation theorem [5] may be applied to find a homeomorphism  $k$  from  $\mathcal{U}^*$  onto  $P[\mathcal{U}^*]$  such that  $d(P(x), k(x)) < f(x)$  for each  $x \in \mathcal{U}^*$ . Then  $h = k^{-1}P$  is the desired map. To see this we need only check that for  $g \in G$  and  $g \subset \mathcal{U}^*$ , there is a  $U \in \mathcal{U}$  such that  $h(g) \cup g \subset U$ . Let  $y = k^{-1}P(g)$ . By our construction there exists a  $U \in \mathcal{U}$  such that both  $P(y)$  and  $k(y)$  belong to  $P[U]$ . But  $k(y) = P(g)$ ; therefore,  $y$  and  $g$  belong to  $U$ , which completes the proof.

Suppose  $M$  is a metric space and  $K$  is a collection of mutually disjoint subsets of  $M$ . If  $g \in K$ , then  $K$  is said to be continuous at  $g$  in case for each positive number  $\varepsilon$ , there exists an open subset  $V$  of  $M$  containing  $g$  such that if  $g' \in K$  and  $g' \cap V \neq \emptyset$ , then  $g \subset S_\varepsilon(g')$  and  $g' \subset S_\varepsilon(g)$ .

THEOREM 1. *Suppose  $G_1, G_2, \dots$  are cellular decompositions of an  $n$ -manifold with boundary  $M(n \neq 4)$  such that*

- (1) If  $g \in H_{G_i}$  and  $g \cap H_{G_j}^* \neq \emptyset$ , then  $g \in H_{G_j}$ .
  - (2) For each  $k = 1, 2, \dots$ , if  $g \in H_{G_k}$ , then  $\{H_{G_i}: i \neq k\} \cup \{g\}$  is continuous at  $g$ .
  - (3) For  $i = 1, 2, \dots$ ,  $M/G_i$  is homeomorphic to  $M$ .
  - (4)  $G = \{g: g \in \bigcup_{i=1}^{\infty} H_{G_i}$  or  $g$  is a point of  $M - (\bigcup_{i=1}^{\infty} H_{G_i}^*)\}$  is an upper semicontinuous decomposition of  $M$ .
- Then  $M/G$  is homeomorphic to  $M$ .

*Proof.* We show that  $G$  satisfies condition  $S$ . Let  $\mathscr{W}$  be a saturated open cover of  $H_G^*$ . The required function  $h$  will be defined as a limit of a sequence of closed, onto maps which are obtained in the following steps.

*Step 1.* Let  $K_1 = \{p \in M: \text{there exists a sequence of nondegenerate elements, each from a different } H_{G_i}, \text{ which converges to } p\}$ . Note that  $K_1$  is a closed subset of  $M$ . We construct a saturated (with respect to  $G$ ) open refinement of  $\mathscr{W}$  which covers  $H_G^*$  and misses  $K_1$ . For each  $g \in H_G$ , let  $U_g$  be saturated open set with compact closure such that

- (1) If  $\varepsilon_g = \min \{\text{diam } g, 1/2 d(g, K_1), 1\}$ , then  $U_g \subset S_{\varepsilon_g}(g)$ .
- (2) If  $g_i \in H_{G_i}$  and  $g_j \in H_{G_j}$  ( $i \neq j$ ) and  $g_i$  and  $g_j$  are contained in  $U_g$ , then  $1/2 \text{diam } g_i < \text{diam } g < 3/2 \text{diam } g_i$ .
- (3)  $U_g$  is contained in some  $W \in \mathscr{W}$  which contains  $g$ .

Parts (1) and (2) are possible because of the continuity condition imposed on the decompositions. Define  $\mathscr{U}'_1 = \{U_g: g \in H_G\}$ . Let  $\mathscr{U}_1$  be a saturated open locally finite star refinement of  $\mathscr{U}'_1$  and  $\mathscr{V}_1 = \{U \in \mathscr{U}_1: U \cap H_{G_i}^* \neq \emptyset\}$ . Observe that it follows from (1) that if  $p \in K_1$ , then  $p \notin \mathscr{U}_1^*$ . Furthermore, from (1) and (2) we have that if  $p \in K_1$  and  $\{x_i\}$  is a sequence of points in  $\mathscr{U}_1^*$  which converge to  $p$ , then the sequence  $\{\text{St}(x_i, \mathscr{U}_1)\}$  also converges to  $p$ .

By Lemma 1, there exists a closed map  $h_1$  from  $M$  onto  $M$  such that

- (1)  $G_1 = \{h_1^{-1}(x): x \in M\}$ .
- (2) If  $x \in M - \mathscr{V}_1^*$ , then  $h_1(x) = x$ .
- (3) If  $g \in G_1$  and  $g \subset \mathscr{U}_1^*$ , then there exists a set of  $U \in \mathscr{U}_1$  such that  $g \cup h_1(g) \subset U$ .

In addition, since  $\mathscr{U}_1$  is saturated with respect to  $G$ , part (3) holds for all  $g \in G$  which are contained in  $\mathscr{U}_1^*$ .

*Step 2.* The decomposition  $G'_2 = \{h_1(g): g \in G_2\}$  is clearly cellular and upper semicontinuous. Let  $P'$  be the projection map from  $M$  onto  $M/G'_2$  and  $P$  the projection map from  $M$  onto  $M/(G_1 \cup G_2)$ . Then  $P'h_1P^{-1}$  is readily seen to be a homeomorphism from  $M/(G_1 \cup G_2)$  onto

$M/G_2$ . But it was shown in [7] that  $M/(G_1 \cup G_2)$  is homeomorphic to  $M$  (using Siebenman's generalization [5] of Armentrout's "projection approximation" theorem [1], the results of [7] may be extended to  $n$ -manifolds for  $n \neq 4$ ).

Let  $K_2 = \{p \in M: \text{there exists a sequence of nondegenerate elements, each from a different } H_{h_1[G_i]}, \text{ which converges to } p\}$ . We construct a saturated (with respect to  $h_1[G]$ ) open refinement of  $h_1[\mathcal{U}_1]$  which covers  $H_{h_1[G]}$  and misses  $K_2$ . Suppose  $g' = h_1(g)$  where  $g \in H_G - H_{G_1}$ . Choose  $U_{g'}$  to be saturated (with respect to  $h_1[G]$ ) open set such that

- (1) If  $\varepsilon_{g'} = \min \{\text{diam } g', 1/2 d(g', K_2), 1/2\}$ , then  $U_{g'} \subset S_{\varepsilon_{g'}}(g')$ .
- (2) If  $g_i \in H_{h_1[G_i]}$  and  $g_j \in H_{h_1[G_j]} (i \neq j)$  and  $g_i$  and  $g_j$  are contained in  $U_{g'}$ , then  $1/2 \text{diam } g_i < \text{diam } g_j < 3/2 \text{diam } g_i$ .
- (3)  $h_1^{-1}(U_{g'}) \subset S_{1/4}(g)$ .
- (4) If  $W = \bigcap \{U: U \in h_1[\mathcal{U}_1] \text{ and } h_1(g) \subset U\}$ , then  $U_{g'} \subset W$ .
- (5) If  $V \in \mathcal{U}_1$  and  $g \cup h_1(g) \subset V$ , then  $U_{g'} \subset V$ .
- (6)  $U_{g'} \cap \text{Cl}(h_1[H_{G_1}^*]) = \emptyset$ .

Let  $\mathcal{U}'_2 = \{U_{g'}: g' \in H_{h_1[G]}\}$  and let  $\mathcal{U}_2$  be a saturated open locally finite star refinement of  $\mathcal{U}'_2$  covering  $H_{h_1[G]}^*$ . Let

$$\mathcal{V}_2 = \{U \in \mathcal{U}_2: U \cap H_{h_1[G_2]}^* \neq \emptyset\}.$$

Note that  $h_1^{-1}(\mathcal{U}_1^*) \subset S_{1/2}(H_G^*)$  and  $h_1^{-1}(\mathcal{V}_2^*) \subset S_{1/2}(H_{G_2}^*)$ .

By Lemma 1, there is a closed map  $h_2$  from  $M$  onto  $M$  such that

- (1)  $G'_2 = \{h_2^{-1}(x): x \in M\}$ .
- (2) If  $x \in M - \mathcal{V}_2^*$ , then  $h_2(x) = x$ .
- (3) For each  $g' \in G'_2$  contained in  $\mathcal{U}_2^*$ , there exists a  $U \in \mathcal{U}_2$  such that  $h_2(g') \cup g' \subset U$ .

*Claim.* For each  $g \in G$  contained in  $\mathcal{U}_1^*$ , there exists a  $W \in \mathcal{U}_1$  such that  $g \cup h_2 h_1(g) \subset W$ .

*Proof of Claim.* Suppose  $g \in G$  and  $g \subset \mathcal{U}_1^*$ . Then there exists  $U \in \mathcal{U}_1$  such that  $h_1(g) \cup g \subset U$ . If  $g \in H_{G_1}$  or if  $h_1(g)$  is not contained in  $\mathcal{V}_2^*$ , then  $h_2 h_1(g) = h_1(g)$ , and we are done. Suppose then that  $g \notin H_{G_1}$  and  $h_1(g) \cap \mathcal{V}_2^* \neq \emptyset$ . Since  $\mathcal{U}'_2$  is a refinement of  $h_1[\mathcal{U}_1]$  and  $\mathcal{U}_2$  is a locally finite star refinement of  $\mathcal{U}'_2$ , we may find  $U_2 \in \mathcal{U}_2$  and  $U_{g'} \in \mathcal{U}'_2$ , where  $h_1(g) = g'$ , such that  $h_1(g) \subset U_2 \subset \text{St}(U_2, \mathcal{U}_2) \subset U_{g'}$ . We first show that there exists a  $V \in \mathcal{U}_1$  such that  $U_{g'} \subset V$ . Of course,  $h_1(g) = g' \subset U_{g'}$ . Let  $V_1, V_2, \dots, V_n$  be those members of  $\mathcal{U}_1$  which contain  $g$ . Then by our construction of  $\mathcal{U}'_2$ ,

$$U_{g'} \subset h_1(V_1) \cap \dots \cap h_1(V_n).$$

Since  $h_1(g) \subset U_{g'}$ , it follows that  $g \subset V_1 \cap \dots \cap V_n$ . But for at least

one  $i = 1, 2, \dots$ , or  $n$ ,  $h_1(g) \cap g \cup V_i$ . Therefore, by (5) in our construction of  $\mathcal{U}'_2$ , it must be the case that  $U_{g'}$  is contained in  $V_i$ .

We need only observe now that if  $Z \in \mathcal{U}'_2$  and  $h_1(g) \subset Z$ , then  $Z \subset V_i$ . This is clear since  $Z \subset \text{St}(U_2, \mathcal{U}'_2) \subset U_{g'} \subset V_i$ . Hence, we have that  $\text{St}(h_1(g), \mathcal{U}'_2)$  is contained in  $V_i$  and since

$$h_2 h_1(g) \subset \text{St}(h_1(g), \mathcal{U}'_2),$$

the proof of the claim is complete.

We continue inductively. Assume now that covers  $\mathcal{U}'_1, \dots, \mathcal{U}'_n$ ,  $\mathcal{U}_1, \dots, \mathcal{U}_n, \mathcal{V}_1, \dots, \mathcal{V}_n$  have been defined so that the conditions listed below are satisfied. We denote  $h_k h_{k-1} \dots h_1$  by  $\hat{h}_k$ , and  $h_0 = \hat{h}_0 =$  identity. For  $i = 1, 2, \dots, n$ , let  $K_i = \{p \in M: \text{there exists a sequence of nondegenerate elements converging to } p \text{ where each element is a member of a different } H_{\hat{h}_{i-1}[G_j]}\}$ .

(1)  $\mathcal{U}'_i = \{U_{g'}: g' \in H_{\hat{h}_{i-1}[G]}\}$  is a collection of saturated (with respect to  $\hat{h}_{i-1}[G]$ ) open sets which refines  $\hat{h}_{i-1}[\mathcal{U}'_{i-1}]$  and misses  $K_i$ . For each  $g'$ ,  $U_{g'}$  is chosen to contain  $g'$  such that

(a) If  $\varepsilon_{g'} = \min\{\text{diam } g', 1/2 d(g', K_i)1/i\}$ , then  $U_{g'} \subset S_{\varepsilon_{g'}}(g')$ .

(b) If  $g_j \in H_{\hat{h}_{i-1}[G_j]}$  and  $g_k \in H_{\hat{h}_{i-1}[G_k]}$  ( $j \neq k$ ) and  $g_j$  and  $g_k$  are contained in  $U_{g'}$ , then  $1/2 \text{diam } g_j < \text{diam } g_k < 3/2 \text{diam } g_j$ .

(2)  $\mathcal{U}'_i$  is a saturated open locally finite star refinement of  $\mathcal{U}'_i$  and  $\mathcal{V}'_i = \{U \in \mathcal{U}'_i: U \cap H_{\hat{h}_{i-1}[G_{i-1}]}^* \neq \emptyset\}$ .

(3) For  $i = 1, 2, \dots, n$  and  $1 \leq j \leq i - 1$ ,

$$h_j^{-1} \dots h_{i-2}^{-1} h_{i-1}^{-1}(\mathcal{U}'_i^*) \subset S_{1/i}(\hat{h}_{j-1}(H_G^*))$$

and

$$h_j^{-1} \dots h_{i-2}^{-1} h_{i-1}^{-1}(\mathcal{V}'_i^*) \subset S_{1/2}(\hat{h}_{j-1}(H_G^*)).$$

(4) For  $i = 1, 2, \dots, n$ ,  $h_i$  is a closed map from  $M$  onto  $M$  such that if  $G'_i = \{\hat{h}_{i-1}(g): g \in G_i\}$  then

(1)  $G'_i = \{h_i^{-1}(x): x \in M\}$ .

(2) If  $x \in M - \mathcal{V}'_i^*$ , then  $h_i(x) = x$ .

(3) For each  $g' \in G'_i$  which is contained in  $\mathcal{U}'_i^*$ , there exists  $U \in \mathcal{U}'_i$ , such that  $h_i(g') \cup g' \subset U$ .

(5) For  $i = 1, 2, \dots, n$  and  $0 \leq j \leq i - 1$ , if  $g \in G$  and  $\hat{h}_{i-1}(g)$  is contained in  $\mathcal{U}'_i^*$ , then there exists  $U \in \mathcal{U}'_{j+1}$  such that  $\hat{h}_j(g) \cup \hat{h}_i(g) \subset U$ .

(6)  $\mathcal{U}'_i^* \cap \text{Cl}(h_{i-1}(H_{G_1}^* \cup \dots \cup H_{G_{i-1}}^*)) = \emptyset$ .

*Step  $n + 1$ .* Let  $G'_{n+1} = \{\hat{h}_n(g): g \in G_{n+1}\}$ . A proof similar to that employed in Step 2 shows that  $M/G'_{n+1}$  is homeomorphic to  $M$ . Let  $K_{n+1} = \{p \in M: \text{there exists a sequence of nondegenerate elements converging to } p \text{ where each element is a member of a different } H_{\hat{h}_n[G_j]}\}$ .

We construct a saturated (with respect to  $\hat{h}_n[G]$ ) open refinement of  $h_n[\mathcal{U}_n]$  which covers  $H_{\hat{h}_n[G]}$  and misses  $K_{n+1}$ . Let  $g' = \hat{h}_n(g)$  where  $g \in H_G - (H_{G_1} \cup \dots \cup H_{G_n})$ . Choose  $U_{g'}$  to be a saturated open set containing  $g'$  such that

(1) If  $\varepsilon_{g'} = \min \{ \text{diam } g', 1/2 d(g', K_{n+1}), 1/n + 1 \}$ , then  $U_{g'} \subset S_{\varepsilon_{g'}}(g')$ .

(2) If  $g_i \in H_{\hat{h}_n[G_i]}$  and  $g_j \in H_{\hat{h}_n[G_j]}$  ( $i \neq j$ ) and  $g_i$  and  $g_j$  are contained in  $U_{g'}$ , then  $1/2 \text{diam } g_i < \text{diam } g_j < 3/2 \text{diam } g_i$ .

(3) For  $i = 1, 2, \dots, n$ ,  $(h_i h_{i+1} \dots h_n)^{-1}(U_{g'}) \subset S_{1/2n}(\hat{h}_{i-1}(g))$ .

(4) For  $i = 1, 2, \dots, n$ , if  $U^i$  is the intersection of those sets in  $\mathcal{U}_i$  which contain  $\hat{h}_{i-1}(g)$ , then

$$U_{g'} \subset \hat{h}_n(U^1) \cap h_n h_{n-1} \dots h_2(U^2) \cap \dots \cap h_n(U^n).$$

(5) For  $0 \leq i < n$ , if  $\hat{h}_i(g) \cup \hat{h}_n(g) \subset U \in \mathcal{U}_n$ , then  $U_{g'} \subset U$ .

(6)  $U_{g'} \cap \text{Cl } \hat{h}_n(H_{G_1}^* \cup \dots \cup H_{G_n}^*) = \emptyset$ .

Let  $\mathcal{U}'_{n+1} = \{U_{g'} : g' \in H_{G'_{n+1}}\}$ , let  $\mathcal{U}_{n+1}$  be a saturated open locally finite star refinement of  $\mathcal{U}'_{n+1}$ , and let  $\mathcal{V}_{n+1} = \{U \in \mathcal{U}_{n+1} : U \cap \hat{h}_n[H_{G'_{n+1}}^*] \neq \emptyset\}$ . By Lemma 1 there exists a closed map  $h_{n+1}$  from  $M$  onto  $M$  such that

(1)  $G'_{n+1} = \{h_{n+1}^{-1}(x) : x \in M\}$ .

(2) If  $x \in M - \mathcal{V}_{n+1}^*$ , then  $h_{n+1}(x) = x$ .

(3) For each  $g \in G'_{n+1}$  contained in  $\mathcal{U}_{n+1}^*$ , there exists  $U \in \mathcal{U}_{n+1}$  such that  $g \cup h_{n+1}(g) \subset U$ .

*Claim.* Suppose  $g' = \hat{h}_{n+1}(g)$  is contained in  $\mathcal{U}_{n+1}^*$  ( $g$  is an element of  $G$ ). Suppose  $0 \leq i < n + 1$ . Then there exists  $U \in \mathcal{U}_{i+1}$  such that  $g' \cup \hat{h}_i(g) \subset U$ .

A proof patterned after the proof of the Claim in Step 2 may be used to establish this Claim.

Define  $h = \text{Lim } \hat{h}_n$ . To see that  $h$  is well defined, we observe that for each  $x \in M$ , there exists an integer  $N$  such that for  $n > N$ ,

$$\hat{h}_n(x) = \hat{h}_N(x) = h(x).$$

This is clearly the case if  $x \in H_G^*$ , since if  $N$  is the first integer such that  $x \in H_{G_N}^*$ , then  $h_N(x)$  does not belong to the succeeding  $\mathcal{U}_n^*$ , and, hence, is left fixed. If  $x \notin \text{Cl } H_G^*$  then choose  $N$  such that

$$d(x, \text{Cl } H_G^*) > \frac{1}{N}.$$

Then  $h_N(x) \notin \mathcal{U}_{N+1}^*$  (see (3) in the inductive Step  $n + 1$ ) and it follows that  $h(x) = \hat{h}_n(x)$  for each  $n > N$ . Finally, consider the case where  $x \in (\text{Cl } H_G^*) - H_G^*$ . If there exists an open set  $U$  such that  $U \cap H_{G_i}^* = \emptyset$  for all but a finite number of  $i$ , then it again follows from (3) of Step  $n + 1$  that the required positive integer  $N$  exists. On the other

hand, if no such  $U$  exists, then there is a sequence  $\{g_{n_i}\}$  of nondegenerate elements from distinct decompositions  $G_{i_n}$  which converges to  $x$ . But it was noted in Step 1 that in this case  $x \notin \mathcal{U}_1^*$  and thus  $h(x) = x$ .

We next show that  $h$  is continuous. Suppose  $\{x_i\}$  is a sequence of points in  $M$  converging to a point  $x$ . If there exists an open set  $U$  containing  $x$  such that  $U \cap H_{G_i}^* = \emptyset$  for all but at most a finite number of  $i$ , then it follows again from (3) of the induction Step  $n + 1$  that  $\{h(x_i)\}$  converges to  $h(x)$ . If no such  $U$  exists, then there are two cases to consider.

*Case 1.*  $x \in (\text{Cl } H_G^* - H_G^*)$ . Suppose for each  $i$ ,  $x_i \in g_{n_i} \in G_{n_i}$ . We may assume that the  $x_i$  lie in  $\mathcal{U}_1^*$  since if not  $h(x_i) = x_i$ . But as it was observed in Step 1, since the sequence  $\{g_{n_i}\}$  converges to  $x$ , we have that the corresponding sequence  $\{\text{St}(g_{n_i}, \mathcal{U}_1)\}$  also converges to  $x$ . It follows from the Claim in Step  $n + 1$ , that  $h(x_i) \in \text{St}(g_{n_i}, \mathcal{U}_1)$ , and, therefore,  $\{h(x_i)\}$  converges to  $h(x)$ .

*Case 2.*  $x \in H_G^*$ . Let  $n$  be the first integer such that  $x \in g_n \in H_{G_n}$ . But then  $\hat{h}_n(g_n)$  is a point and our construction in the inductive steps reduces this case to Case 1.

That  $h$  is onto may be seen by the following argument. Suppose  $p$  is a point in  $M$ . We assume that  $p \in g' \in G$  where  $g' \subset \mathcal{U}_1^*$  (if not,  $h(p) = p$ ). For each positive integer  $i$ , there exists a point  $x_i$  in  $\mathcal{U}_1^*$  such that  $h_i(x_i) = p$ . It follows from the Claim in Step  $n + 1$  that for each  $i$ ,  $x_i \in \text{St}(g', \mathcal{U}_1)$ . Since  $\text{St}(g', \mathcal{U}_1)$  has compact closure (see Step 1), there exists an accumulation point  $x$  of the sequence  $\{x_i\}$ . For simplicity of notation let us assume that  $\{x_i\}$  converges to  $x$ . We show that  $h(x) = p$ .

Let  $g \in G$  be the member of the decomposition which contains  $x$ . Choose  $N$  large enough so that  $\hat{h}_n(g) = h(g)$  for each  $n \geq N$ . First we suppose that there exists a positive integer  $K \geq N$  such that for  $n \geq K$ ,  $S_{1/K}(g) \cap H_{G_n}^* = \emptyset$ . Of course, the sequence  $\{\hat{h}_K(x_i)\}$  converges to  $\hat{h}_K(x)$ . But it follows from (3) of Step  $n + 1$ , that for  $i$  sufficiently large, we will have  $\hat{h}_K(x_i) = \hat{h}_i(x_i) = h(x_i)$ . Thus  $h(x) = p$ , since  $\hat{h}_i(x_i) = p$  for all  $i$ .

Now suppose that each open set containing  $x$  intersects an infinite number of the  $H_{G_i}^*$ , and, hence, each open set containing  $\hat{h}_N(x)$  will also intersect infinitely many of the sets  $H_{\hat{h}_N[G_i]}$ . Thus,  $\hat{h}_N(x)$  belongs to  $K_{n+1}$  (see Step  $n + 1$ ). Since  $\{\hat{h}_N(x_i)\}$  converges to  $\hat{h}_N(x)$ , it follows from conditions (1) and (3) of Step  $n + 1$  that the sequence

$$\{\text{St}(\hat{h}_N(x_i), \mathcal{U}_N)\}$$

also converges to  $\hat{h}_N(x)$ .

But the Claim in this step ensures that for  $j > N$ ,  $\hat{h}_j(x_i) \cup \hat{h}_N(x_i)$  belongs to  $\text{St}(\hat{h}_N(x_i), \mathcal{U}_N)$ . In particular then for  $i > N$ ,

$$\hat{h}_i(x_i) \cup \hat{h}_N(x_i) \subset \text{St}(\hat{h}_N(x_i), \mathcal{U}_N),$$

and since,  $\hat{h}_i(x_i) = p$ , it again follows that  $h(x) = p$ . Thus  $h$  is an onto map.

It is easily seen from our construction of  $h$  that  $G = \{h^{-1}(x) : x \in M\}$ .

Finally, we must show that  $h$  is closed. It suffices to show that if  $K$  is a compact subset of  $M$ , then  $h^{-1}(K)$  is also compact. Since  $h$  is onto, for each  $x \in K$ , there exists a unique element  $g_x \in G$  such that  $h(g_x) = x$ . If  $g_x \subset \mathcal{U}_1^*$ , let  $U_{g_x}$  be a member of  $\mathcal{U}_1$  which contains  $g_x$ . If  $g_x$  is not contained in  $\mathcal{U}_1^*$  let  $U_{g_x}$  be an open set containing  $g_x$  with compact closure. Note that it follows from Step 1 that if  $g_x$  is contained in  $\mathcal{U}_1^*$ , then  $\text{St}(U_{g_x}, \mathcal{U}_1)$  has compact closure. Since if  $g_x \subset \mathcal{U}_1^*$ , then  $g_x \cup h(g_x) \subset \text{St}(U_{g_x}, \mathcal{U}_1)$ , and if  $g_x$  is not contained in  $\mathcal{U}_1^*$ , then  $h(g_x) = g_x$ , the collection  $\{U_{g_x} : x \in K\}$  is an open cover of  $K$ . Let  $U_{g_{x_1}}, \dots, U_{g_{x_n}}$  be a finite subcover of  $K$ , where the first  $i$  terms are members of  $\mathcal{U}_1$ . To finish the proof we need only observe that

$$h^{-1}(K) \subset \text{St}(g_{x_1}, \mathcal{U}_1) \cup \dots \cup \text{St}(g_{x_i}, \mathcal{U}_1) \cup U_{g_{x_{i+1}}} \cup \dots \cup U_{g_{x_n}}$$

and that the right hand set has compact closure. Thus, the conditions of property  $S$  have been satisfied, and, hence,  $M/G$  is homeomorphic to  $M$ .

A decomposition of a metric space is said to be *nondegenerately continuous* if for each  $g \in G$ ,  $H_g \cup \{g\}$  is continuous at  $g$ .

**COROLLARY 1.** *Suppose  $G$  is a cellular nondegenerately continuous upper semicontinuous decomposition of  $E^3$ . Suppose there exists a countable number of planes in  $E^3$ ,  $Q_1, Q_2, \dots$  such that for each  $g \in H_g$ ,  $g$  is contained in at least one of these planes. Then  $E^3/G$  is homeomorphic to  $E^3$ .*

*Proof.* For  $i = 1, 2, \dots$ , let  $G_i$  be the decomposition of  $E^3$  such that  $H_{G_i} = \{g \in H_G : g \subset Q_i\}$ . Then  $E^3/G_i$  is homeomorphic to  $E^3$  [3], and since it is readily verified that  $G_1, G_2, \dots$  satisfy the conditions of Theorem 1,  $E^3/G$  is homeomorphic to  $E^3$ .
