GENERALISATION OF A “SQUARE” FUNCTIONAL EQUATION

ARJUN K. GUPTA
GENERALISATION OF A "SQUARE" FUNCTIONAL EQUATION

A. K. GUPTA

Recently the difference equation defining the triangular array of binomial coefficients, known as Pascal's triangle, has been extended to a square functional equation which generates a tableau of numbers. In the present paper these results have been generalised and the generating function for this new set of numbers has been obtained. Several relations among these numbers, which help construct the tableau, are studied. Some further generalisations of these numbers are also given.

1. Introduction. Let $I$, $I^+$ and $R$ denote the set of integers, the set of nonnegative integers and the set of real numbers, respectively. The function $f$ defined on the lattice $I^+ \times I^+$ which satisfies the difference equation

\[ f(n + 1, r) = f(n, r) + f(n, r - 1) \]

and is uniquely determined by initial values on $I^+ \times \{0\}$ and $\{0\} \times I^+$ describes the well known triangular array of numbers. This has been generalised by many authors (see Gupta [4], [5], Cadogan [1], Stanton and Cowan [6]). In [5] Gupta has studied the square functional equation

\[ g(n + 1, r + 1) = g(n, r + 1) + g(n + 1, r) + g(n, r) \]

which together with the boundary conditions $g(n, 0) = g(0, r) = 1, \forall n, r \in I^+$ uniquely determines a tableau. However, here we obtain a more general class of functions defined by

\[ g: I^+ \times I^+ \rightarrow R \]

satisfying the general square functional equation

\[ g(n, r) = p_1 g(n - 1, r) + p_2 g(n, r - 1) \\
+ p_3 g(n - 1, r - 1)p_i \in R, \quad i = 1, 2, 3, \]

subject to certain initial conditions $g(n, 0) = p_i^n$. It may be noted that $g(n, r)$ is not symmetric in $n$ and $r$. Also notice that if $p_i = 1, i = 1, 2, 3$ this reduces to the case studied earlier (Gupta [5]). In the next section we will give some results for this generalised function $g(n, r)$. However details will be skipped since they are similar to the results in Gupta [5] or Stanton and Cowan [6].
2. Properties of \( g(n, r) \). Let us define the generating function \( A(x, y) \) by

\[
A(x, y) = \sum_{n=0}^{\infty} \sum_{r=0}^{\infty} g(n, r)x^ny^r
\]

and invoke the recurrence relation (3), along with the initial conditions, we get

\[
\frac{1}{1 - px - py - pxy} = \sum_{n=0}^{\infty} \sum_{r=0}^{\infty} g(n, r)x^ny^r
\]

which expresses \( A(x, y) \) as a rational function, and may be used to evaluate \( g(n, r) \) either explicitly or asymptotically. However if we let \( g(n, 0) = d \), \( \forall n \) the generating function is given by

\[
A(x, y) = \frac{d(1 - py)}{(1 - y)(1 - px - pxy)}. \]

**Lemma 1.** \( g(n, r) \) is the coefficient of \( x^n \) in the expansion of \((p_z + p_x)^r/(1 - px)^{r+1}\) and is given by

\[
g(n, r) = \left(\frac{p_z}{p_x}\right)^n p_z^r \sum_k \binom{r}{n-k} \binom{r+k}{k} \left(\frac{p_x p_z}{p_z}\right)^k.
\]

**Proof.** Define \( A_r(x) = \sum_{n=0}^{\infty} g(n, r)x^n \). Then it is easy to show, by using (3) and the initial conditions that

\[
A_r(x) = \left(\frac{p_z + p_x}{1 - px}\right)^r.
\]

By expanding the right-hand side of (7) we get the result (6).

Again if we let \( g(n, 0) = d \), then \( g(n, r) \) is the coefficient of \( x^n \) in the expansion of

\[
\frac{d}{1-x} \left[\frac{p_z + p_x}{1 - px}\right]^r.
\]

**Lemma 2.** We have,

\[
g(n, r) = \left(\frac{p_z}{p_x}\right)^n \sum_{\alpha} \binom{n}{\alpha} \binom{r+\alpha}{n} \left(\frac{p_x p_z}{p_z}\right)^\alpha,
\]

\[
= \left(\frac{p_z}{p_x}\right)^n \sum_{\beta} \binom{r}{\beta} \binom{n}{\beta} \left(1 + \frac{p_x p_z}{p_z}\right)^\beta.
\]

**Proof.** Similar to the proof of Lemma 2 of [6].

**Lemma 3.** If \( d_m = \sum_{n+r-m} g(n, r) \), then
(9) \[ d_{m+2} = (p_i + p_2)d_{m+1} + p_3d_m. \]

If we let \( p_i = 1, i = 1, 2, 3 \) we get Lemma 4 of [6].

The following relation can easily be verified and corresponds to Lemma 3 of [5].

(10) \[ g(n, r + s) = \sum_k g(k, r)[g(n - k, s) - p_i g(n - k - 1, s)]. \]

The relationship of \( g(n, r) \) with the hypergeometric function \( _2F_1 \) is given by

(11) \[ g(n, r) = \left( \frac{p_i}{p_2} \right)^n _2F_1(-n, r; 1; 1 + \frac{p_1p_2}{p_3}). \]

This Gauss hypergeometric series reduces to a polynomial of degree \( n(r) \) in \( (1 + (p_1p_2/p_3)) \) for \( n(r) = 0, 1, 2, \ldots \). From this relation (11) we can derive many results, of which we give only one below.

\[
g(n, r) = \frac{1}{n} \left[ (n - 1) \frac{p_1p_2}{p_3} g(n - 2, r)
- \left( (n - 1 - r)(1 + \frac{p_1p_2}{p_3}) - 2n + 1 \right) g(n - 1, r) \right].
\]

This relation corresponds to Lemma 5 of [5] and is useful in computing the numbers \( g(n, r) \). Results corresponding Lemma 6 of [5] and many more can be similarly obtained.

3. Further generalisation. In general \( g(n, 0) = d_n \in \mathbb{R} \). In §2 we have treated the special case when \( d_n = p_i \). In fact different initial conditions give rise to (i) an Arithmetic progression and (ii) Geometric progression for the numbers \( g(n, 0) \). However in general we can prove the following.

THEOREM 1. We have,

(12) \[ g(n, r) = \sum_{u+v+w=r} \binom{r}{u, v, w} p_1^u p_2^v p_3^w g(n - r + v, u) \]

where

\[
\binom{r}{u, v, w} = \frac{r!}{u!v!w!}.
\]

With initial conditions explicit formulae can be obtained.

We can further generalise by considering
where
\[ g(n, m, r) = p_1 g(n, m, r - 1) + p_2 g(n, m - 1, r - 1) + p_3 g(n - 1, m - 1, r - 1). \]

Then \( g(n, m, r) \) satisfies the following theorem, (see [1]).

**THEOREM 2.** We have
\[
  g(n, m, r) = \sum_{u+v+w=r} \binom{r}{u, v, w} p_1^u p_2^v p_3^w g(n - w, m - v - w, 0).
\]

Many generalisations are possible by increasing the dimension of the lattice, and/or by redefining the functional equation that gives the recurrence relation.

**4. REMARK.** Earlier in [2] and [3] the value of \( g(n, r) \) found its applications in sphere packing, coding metrics and chess puzzles. Since the present function is a generalisation of this earlier result, it is hoped that these numbers too will be of use in such context.

AMERICAN MATHEMATICAL SOCIETY

The Supporting Institutions listed above contribute to the cost of publication of this Journal, but they are not owners or publishers and have no responsibility for its content or policies.

Mathematical papers intended for publication in the Pacific Journal of Mathematics should be in typed form or offset-reproduced, (not dittoed), double spaced with large margins. Underline Greek letters in red, German in green, and script in blue. The first paragraph or two must be capable of being used separately as a synopsis of the entire paper. Items of the bibliography should not be cited there unless absolutely necessary, in which case they must be identified by author and Journal, rather than by item number. Manuscripts, in triplicate, may be sent to any one of the editors. Please classify according to the scheme of Math. Reviews, Index to Vol. 39. All other communications should be addressed to the managing editor, or Elaine Barth, University of California, Los Angeles, California, 90024.

The Pacific Journal of Mathematics expects the author's institution to pay page charges, and reserves the right to delay publication for nonpayment of charges in case of financial emergency.

100 reprints are provided free for each article, only if page charges have been substantially paid. Additional copies may be obtained at cost in multiples of 50.

The Pacific Journal of Mathematics is issued monthly as of January 1966. Regular subscription rate: $72.00 a year (6 Vols., 12 issues). Special rate: $36.00 a year to individual members of supporting institutions.

Subscriptions, orders for back numbers, and changes of address should be sent to Pacific Journal of Mathematics, 103 Highland Boulevard, Berkeley, California, 94708.
