## ON $M$ -PROJECTIVE AND $M$ -INJECTIVE MODULES

G. AZUMAYYA, F. MBUNTUM AND K. VARADARAJAN

In this paper necessary and sufficient conditions are obtained for a direct sum  $\bigoplus_{\alpha \in J} A_\alpha$  of  $R$ -modules to be  $M$ -injective in the sense of Azumaya. Using this result it is shown that if  $\{A_\alpha\}_{\alpha \in J}$  is a family of  $R$ -modules with the property that  $\bigoplus_{\alpha \in K} A_\alpha$  is  $M$ -injective for every countable subset  $K$  of  $J$  then  $\bigoplus_{\alpha \in J} A_\alpha$  is itself  $M$ -injective. Also we prove that arbitrary direct sums of  $M$ -injective modules are  $M$ -injective if and only if  $M$  is locally noetherian, in the sense that every cyclic submodule of  $M$  is noetherian. We also obtain some structure theorems about  $Z$ -projective modules in the sense of Azumaya, where  $Z$  denotes the ring of integers. Writing any abelian group  $A$  as  $D \oplus H$  with  $D$  divisible and  $H$  reduced, we show that if  $A$  is  $Z$ -projective then  $H$  is torsion free and every pure subgroup of finite rank of  $H$  is a free direct summand of  $H$ .

Most of these results were motivated by the results of B. Sarath and K. Varadarajan regarding injectivity of direct sums.

1.  $M$ -projective and  $M$ -injective modules. Throughout this paper  $R$  denotes a ring with  $1 \neq 0$  and all the modules considered are left unitary modules over  $R$ . By an ideal in  $R$  we mean a left ideal in  $R$ .  $M$  denotes a fixed  $R$ -module. We first recall the notions of  $M$ -projective and  $M$ -injective modules originally introduced by one of the authors [1].

DEFINITION 1.1. An  $R$ -module  $H$  is called  $M$ -projective, if given a diagram

$$\begin{array}{ccc} & H & \\ & \downarrow f & \\ M \xrightarrow{\varphi} & N & \longrightarrow 0 \end{array}$$

of maps of  $R$ -modules with the horizontal sequence exact,  $\exists$  a map  $h: H \rightarrow M$  such that  $\varphi \circ h = f$ .

The notion of an  $M$ -injective module is defined dually.

REMARK 1.2. Regarding  $R$  as a left module over itself in the usual way it turns out that  $R$ -injective modules are the same as the injective modules over  $R$ . However  $R$ -projective modules are not the same as projective modules over  $R$ .

LEMMA 1.3. *Every divisible abelian group  $D$  is  $Z$ -projective.*

*Proof.* Trivial consequence of the fact  $\text{Hom}(D, Z) = 0 = \text{Hom}(D, Z_k)$  whenever  $D$  is divisible.

REMARK 1.4. We know that projective modules over  $Z$  are free. Hence no divisible abelian group  $D \neq 0$  is projective over  $Z$ .

LEMMA 1.5. *Suppose  $H$  is a torsion free abelian group with the property that every pure subgroup of rank 1 of  $H$  is a free direct summand of  $H$ . Then every pure subgroup of finite rank of  $H$  is also a free direct summand of  $H$ .*

*Proof.* By induction on the rank of the subgroup. Let  $S$  be a pure subgroup of  $H$  of rank  $k$  with  $k > 1$ . We can pick a pure subgroup  $B$  of  $S$  of rank 1. Then  $B$  is also pure in  $H$  and hence by assumption  $B$  is free abelian and  $H = C \oplus B$  for some  $C$ . Since  $S \supset B$  we get  $S = (S \cap C) \oplus B$ . Now  $S \cap C$  is of rank  $(k - 1)$  and pure in  $S$  and hence pure in  $H$ . By the inductive hypothesis  $S \cap C$  is free abelian and  $H = (S \cap C) \oplus L$  for some  $L$ . From  $C \supset S \cap C$  we now  $C = (S \cap C) \oplus (L \cap C)$ . Thus  $S = (S \cap C) \oplus B$  is free abelian and

$$\begin{aligned} H &= C \oplus B = (S \cap C) \oplus (L \cap C) \oplus B \\ &= (S \cap C) \oplus B \oplus (L \cap C) = S \oplus (L \cap C). \end{aligned}$$

DEFINITION 1.6. We say that a torsion free abelian group  $H$  has property (P) if every pure subgroup of finite rank of  $H$  is free and a direct summand of  $H$ .

Given any abelian group  $A$  we can write  $A$  as  $D \oplus H$  where  $D$  is the maximal divisible subgroup of  $A$  and  $H$  is reduced. Also  $H \cong A/D$  is well-determined up to an isomorphism. We will refer to any group isomorphic to  $H$  as the reduced part of  $A$ .

THEOREM 1.7. *Suppose  $H$  is reduced abelian group which is  $Z$ -projective. Then  $H$  is torsion-free with property (P).*

*Proof.* It is well-known that a reduced abelian group which is not torsion-free admits of a nonzero finite cyclic direct summand [3, Th 9, p. 21]. Clearly the identity map  $Z_m \rightarrow Z_m$  (for  $m \geq 1$ ) can not be lifted to a map  $Z_m \rightarrow Z$ . This proves that  $Z_m$  is not  $Z$ -projective. Hence if a reduced abelian group  $H$  is  $Z$  is  $Z$ -projective it has to be torsion free.

For any  $a \neq 0$  in  $H$  let  $S_a = \{x \in H \mid x \text{ and a linearly dependent over } Z\}$ . Then it is trivial to see that  $S_a$  is a pure subgroup of

rank 1 in  $H$ . Moreover  $S_\alpha$  is reduced since  $H$  is. Hence  $\exists$  a prime  $p$  such that  $S_\alpha \neq pS_\alpha$ . Let  $c \in S_\alpha$  be such that  $c \notin pS_\alpha$ . Since  $S_\alpha$  is a pure subgroup of  $H$  we see that  $c \notin pH$ . Hence  $\eta(c) \neq 0$  where  $\eta: H \rightarrow H/pH$  denotes the canonical quotient map. Regarding  $H/pH$  as a vector space over  $Z_p$  we can complete  $\eta(c)$  to a basis  $\{\eta(c)\} \cup \{u_j\}_{j \in J}$  of  $H/pH$  over  $Z_p$ . Let  $\theta: H/pH \rightarrow Z_p$  be the  $Z_p$ -linear map determined by  $\theta(\eta(c)) = 1 \in Z_p$  and  $\theta(u_j) = 0$  for all  $j \in J$ . The  $Z$ -projectivity of  $H$  now yields a map  $h: H \rightarrow Z$  with

$$\begin{array}{ccc} & H & \\ & \swarrow h & \downarrow \theta \circ \eta \\ Z & \xrightarrow{\varphi} & Z_p \longrightarrow 0 \end{array}$$

commutative, where  $\varphi: Z \rightarrow Z_p$  is the canonical quotient map. From  $\varphi h(c) = \theta \circ \eta(c) = 1 \in Z_p$  it follows that  $\varphi h(c) \neq 0$ . Hence  $g = h|_{S_\alpha}: S_\alpha \rightarrow Z$  is a non-zero homomorphism. It follows that  $\text{Im } g = kZ$  for some integer  $k \geq 1$ . Composing  $g$  with the obvious isomorphism  $kZ \cong Z$  we get an epimorphism  $g': S_\alpha \rightarrow Z$ . Since  $Z$  is free the sequence  $S_\alpha \xrightarrow{g'} Z \rightarrow 0$  splits.  $S_\alpha$  being a torsion-free group of rank 1 it now follows that  $S_\alpha \xrightarrow{g'} Z$  is an isomorphism. Thus for  $\alpha \neq 0$  in  $H$  the subgroup  $S_\alpha$  is isomorphic to  $Z$ .

Our next step is to show that  $S_\alpha$  is a direct summand of  $H$ . Let  $c$  be a generator for  $S_\alpha \cong Z$  and  $V = \{\alpha \in \text{Hom}(H, Z) \mid \alpha(c) \neq 0\}$ . From what we have seen already  $V$  is a nonempty set. Let  $l = \min_{\alpha \in V} |\alpha(c)|$ . We will show that  $l = 1$ . Suppose on the contrary  $l > 1$ . There definitely exists an element  $\alpha \in V$  such that  $\alpha(c) = l$ . Let  $p$  be a prime divisor of  $l$  and  $l = kp$ . Now  $c \notin pS_\alpha$ . The argument used already yields a map  $h: H \rightarrow Z$  such that  $\varphi h(c) = 1 \in Z_p$ . This means  $h(c) = np + 1$  for some  $n \in Z$ . Writing  $n = kd + r$  with  $d \in Z$  and  $r$  an integer satisfying  $0 \leq r < k$  consider the element  $h - d\alpha \in \text{Hom}(H, Z)$ . Now,  $(h - d\alpha)(c) = np + 1 - dl = np + 1 - dkp = rp + 1$ . Clearly,  $0 < rp + 1 < rp + p = (r + 1)p \leq kp = l$ . Thus  $\beta = h - d\alpha$  is in  $V$  and  $|\beta(c)| = rp + 1 < l$ , contradicting the definition of  $l$ . This contradiction proves that  $h = 1$ . It now follows that  $\exists$  an  $\alpha: H \rightarrow Z$  with  $\alpha(c) = 1$ , in which case  $\exists$  a splitting  $\mu: Z \rightarrow H$  for  $\alpha$  with  $\mu(1) = c$ . Hence  $S_\alpha = \mu(Z)$  is a direct summand of  $H$ .

It is clear that every pure subgroup of rank 1 of  $H$  is of the form  $S_\alpha$  for some  $\alpha \neq 0$  in  $H$ . Now appealing to Lemma 1.5 we immediately see that  $H$  has property (P).

**COROLLARY 1.8.** *Let  $A = D \oplus H$  with  $D$  the maximal divisible subgroup of  $A$ . If  $A$  is  $Z$ -projective then  $H$  is torsion-free and*

has property (P).

**COROLLARY 1.9.** *A finitely generated abelian group  $A$  is  $Z$ -projective  $\Leftrightarrow A$  is free of finite rank.*

**COROLLARY 1.10** *Suppose  $H$  is a reduced decomposable torsion-free abelian group. (i.e.,  $H$  is the direct sum of rank 1 torsion-free abelian groups). Then  $H$  is  $Z$ -projective  $\Leftrightarrow H$  is free.*

**PROPOSITION 1.11.** *Let  $p$  be a prime. An abelian group  $A$  is  $Z_{p^\infty}$ -injective if and only if  $A \cong (\bigoplus_{\alpha \in J} Z_{p^\infty}) \oplus B$ , a direct sum of copies of  $Z_{p^\infty}$  with an abelian group  $B$  having no  $p$ -torsion.*

*Proof.* Suppose  $A \cong (\bigoplus_{\alpha \in J} Z_{p^\infty}) \oplus B$  with  $B$  having no  $p$ -torsion. Since  $\bigoplus_{\alpha \in J} Z_{p^\infty}$  is divisible, it is injective over  $Z$  and hence  $Z_{p^\infty}$ -injective as well. The only subgroups of  $Z_{p^\infty}$  are  $Z_{p^\infty}$  and  $Z_{p^k}$  for some integer  $k \geq 1$ . When  $B$  has no  $p$ -torsion  $\text{Hom}(Z_{p^k}, B) = 0 = \text{Hom}(Z_{p^\infty}, B)$ . This proves that  $B$  is  $Z_{p^\infty}$ -injective.

Conversely, assume  $A$  to be  $Z_{p^\infty}$ -injective. Let  $\alpha \in A$  be an element in the  $p$ -primary torsion of  $A$ . Suppose the order of  $\alpha$  is  $p^k$ . Then  $\exists$  a homomorphism  $Z_{p^k} \xrightarrow{f} A$  carrying the element 1 of  $Z_{p^k}$  to  $\alpha$ . Since  $A$  is  $Z_{p^\infty}$ -injective  $\exists$  an extension  $g: Z_{p^\infty} \rightarrow A$  of  $f$ . Then  $\text{Im } g$  is divisible,  $\alpha \in \text{Im } g$  and  $\text{Im } g$  is in the  $p$ -primary torsion of  $A$ . This proves that the  $p$ -primary torsion of  $A$  is divisible. Since any divisible subgroup of  $A$  is a direct summand of  $A$  and since any divisible  $p$ -primary abelian group is a direct sum of copies of  $Z_{p^\infty}$  it follows that  $A \cong (\bigoplus_{\alpha \in J} Z_{p^\infty}) \oplus B$  with  $B$  having no  $p$ -torsion.

We now recall the definitions of an  $M$ -epimorphism and an  $M$ -monomorphism due to one of the authors [1], and state two results due to him.

**DEFINITION 1.12.** (i) Let  $A, B$  be  $R$ -modules and  $\theta: A \rightarrow B$  an epimorphism.  $\theta$  is said to be an  $M$ -epimorphism if  $\exists$  a map  $\psi: A \rightarrow M$  such that  $\text{Ker } \theta \cap \text{Ker } \psi = 0$ .

(ii) Let  $\alpha: A \rightarrow B$  be a monomorphism.  $\alpha$  is called an  $M$ -monomorphism if  $\exists$  a map  $\beta: M \rightarrow B$  such that  $\text{Im } \alpha$  and  $\text{Im } \beta$  together generate  $B$ .

**PROPOSITION 1.13** [1], [5]. *The following conditions on an  $R$ -module  $H$  are equivalent.*

- (1)  $H$  is  $M$ -projective
- (2) Given any  $M$ -epimorphism  $\theta: A \rightarrow B$  and any  $f: H \rightarrow B \in$  a map  $h: H \rightarrow A$  such that  $\theta \circ h = f$
- (3) Every  $M$ -epimorphism  $\theta: C \rightarrow H$  splits.

PROPOSITION 1.14. *Dual of Proposition 1.13.*

DEFINITION 1.15. For any module  $H$  let  $C^p(H)$  (respy  $C^i(H)$ ) = the class of all modules  $M$  such that  $H$  is  $M$ -projective (respy  $M$ -injective). For any module  $M$  let  $C_p(M)$  (respy  $C_i(M)$ ) denote the class of  $M$ -projective (respy  $M$ -injective) modules.

PROPOSITION 1.16 [1], [5].

(1)  $C^p(H)$  is closed under submodules, homomorphic images and the formation of finite direct sums.

(2)  $C^i(H)$  is closed under submodules, homomorphic images and arbitrary direct sums.

(3)  $C_p(H)$  (respy  $C_i(H)$ ) is closed under direct sums (respy direct products) and direct summands (respy direct factors)

REMARKS.

1.17. In general  $C^p(H)$  is not closed under formation of arbitrary direct sums. For instance let  $R = Z$  and  $H = Q$  the additive group of the rationals. From Lemma 1.3 we see that  $Q$  is  $Z$ -projective. Thus  $Z \in C^p(Q)$ . Let  $J$  be an infinite set and for each  $\alpha \in J$  let  $M_\alpha = Z$ . Then each  $M_\alpha \in C^p(Q)$ . Clearly  $Q$  is a quotient of  $\bigoplus_{\alpha \in J} M_\alpha$  and the identity map of  $Q$  can not be lifted to a map of  $Q$  into  $\bigoplus_{\alpha \in J} M_\alpha$ . This means  $\bigoplus_{\alpha \in J} M_\alpha \notin C^p(Q)$ .

1.17'. Since  $C^p(H)$  is closed under submodules from 1.17 it follows that  $C^p(H)$  in general is not closed under formation of arbitrary direct products.

1.18. In general  $C^i(H)$  is not closed under formation of arbitrary direct products. Let  $R = Z$  and  $H = Z$ . From Proposition 1.11 we have  $Z_{p^\infty} \in C^i(Z)$ . Let  $M = \prod_p Z_{p^\infty}$ , the direct product taken over all primes. It is known and quite easy to see that  $\exists$  a subgroup of  $M$  which is isomorphic to  $Q$ . If  $M \in C^i(Z)$  from (2) of Proposition 1.16 it would that  $Q \in C^i(Z)$ . Since the identity map of  $Z$  can not be extended to a map of  $Q$  into  $Z$  it follows that  $Z$  is not  $Q$ -injective. In other words  $Q \notin C^i(Z)$ . This in turn implies  $M \notin C^i(Z)$ .

2.  $M$ -injectivity of direct sums. For any module  $A$  and any  $x \in A$  we denote the left annihilator  $\{\lambda \in R \mid \lambda x = 0\}$  of  $x$  by  $L_x$ .

DEFINITION 2.1. An element  $x \in A$  is said to be dominated by  $M$  if  $L_x \supset L_m$  for some  $m \in M$ .

Given a family  $\{A\}_{\alpha \in J}$  of modules let  $x$  be the element of  $\prod_{\alpha \in J} A_\alpha$  whose  $\alpha$ -component is  $x_\alpha$ . Let  $I_x = \{\lambda \in R \mid \lambda x \in \bigoplus_{\alpha \in J} A_\alpha\}$ .

DEFINITION 2.2. We call  $x \in \prod_{\alpha \in J} A_\alpha$  a special element if  $I_x x_\alpha =$

0 for almost all  $\alpha$ . In other words  $\exists$  a finite subset  $F$  of  $J$  such that  $\lambda x_\alpha = 0$  for all  $\lambda \in I_x$  and for all  $\alpha \notin F$ .

**PROPOSITION 2.3.**  *$A$  is  $M$ -injective  $\Leftrightarrow A$  is  $Rm$ -injective for all  $m \in M$ .*

*Proof.* This is an easy consequence of 1.16 (2). The implication  $\Rightarrow$  follows from the closedness of  $C^i(A)$  under submodules. As for  $\Leftarrow$ , by the closedness of  $C^i(A)$  under direct sums it follows that  $A$  is  $\bigoplus_{m \in M} Rm$ -injective. Since  $M$  is a homomorphic image of  $\bigoplus_{m \in M} Rm$  and since  $C^i(A)$  is closed under homomorphic images, it follows that  $A$  is  $M$ -injective.

**THEOREM 2.4.**  *$\bigoplus_{\alpha \in J} A_\alpha$  is  $M$ -injective  $\Leftrightarrow$  each  $A_\alpha$  is  $M$ -injective and every element of  $\prod_{\alpha \in J} A_\alpha$  dominated by  $M$  is special.*

*Proof.*  $\Rightarrow$ : Let  $x \in \pi A_\alpha$  be dominated by  $M$ , that is, there is an  $m \in M$  such that  $L_m \subset L_x$ . This implies that the mapping  $\lambda m \rightarrow \lambda x (\lambda \in R)$  is well defined and gives a homomorphism  $f: Rm \rightarrow \pi A_\alpha$ . The image of the submodule  $I_x m$  by  $f$  is clearly  $I_x x (\subset \bigoplus A_\alpha)$ . Thus the restriction of  $f$  to  $I_x m$  is regarded as a homomorphism  $I_x m \rightarrow \bigoplus A_\alpha$ . Since  $\bigoplus A_\alpha$  is  $Rm$ -injective, this homomorphism can be extended to a homomorphism  $Rm \rightarrow \bigoplus A_\alpha$  which means that there exists an  $u \in \bigoplus A_\alpha$  such that  $\lambda x = \lambda u$  for all  $\lambda \in I_x$ . It follows then that  $I_x x \alpha = I_x u_\alpha$  for all  $\alpha \in J$ . But since  $u \alpha = 0$  for almost all  $\alpha$ , it follows that  $I_x x \alpha = 0$  for almost all  $\alpha$  too, i.e.,  $x$  is special.

$\Leftarrow$ : Let  $m \in M$  and consider the cyclic submodule  $Rm$  of  $M$ . Let  $I$  be a left ideal of  $R$ . Then  $IM$  is a submodule of  $Rm$ . (Conversely every submodule of  $Rm$  is of the form  $Im$  with a suitable left ideal  $I$ ). Let there be given a homomorphism  $h: Im \rightarrow \bigoplus A_\alpha$ . Then since  $\bigoplus A_\alpha \subset \pi A_\alpha$  and  $\pi A_\alpha$  is  $M$ -whence  $Rm$ -injective,  $h$  can be extended to a homomorphism  $Rm \rightarrow \pi A_\alpha$ . Let  $x \in \pi A_\alpha$  be the image of  $m$ . Then the homomorphism is given by  $\lambda m \rightarrow \lambda x (\lambda \in R)$ . Therefore it follows that  $Ix = h(Im) \subset \bigoplus A_\alpha$  whence  $I \subset I_x$ . On the other hand, since clearly  $L_m \subset L_x$ ,  $x$  is dominated by  $M$  and thus  $x$  is special by assumption, i.e.,  $I_x x_\alpha = 0$  whence  $Ix_\alpha = 0$  for almost all  $\alpha$ . Let  $u$  be the element of  $\bigoplus A_\alpha$  whose  $\alpha$ -component is  $x_\alpha$  or 0 according as  $Ix_\alpha \neq 0$  or  $Ix_\alpha = 0$ . Then it is clear that  $\lambda u = \lambda x$  for all  $\lambda \in I$ . Further, it is also clear that  $L_m \subset L_x \subset L_u$  and therefore the mapping  $\lambda m \rightarrow \lambda u (\lambda \in R)$  is well defined. This mapping gives a homomorphism  $f: Rm \rightarrow \bigoplus A_\alpha$  which is an extension of  $h$ , because  $f(\lambda m) = \lambda u = \lambda x$  for all  $\lambda \in I$ . This implies that  $\bigoplus A_\alpha$  is  $Rm$ -injective and so is  $M$ -injective (by Proposition 2.3).

**THEOREM 2.5.** *The direct sum of any family of  $M$ -injective modules is  $M$ -injective  $\Leftrightarrow$  every cyclic submodule of  $M$  is noetherian.*

*Proof.*  $\Leftarrow$ . Let  $\{A_\alpha\}$  be a family of  $M$ -injective modules. Let  $x$  be an element of  $\pi A_\alpha$  dominated by  $M$ ; thus there is an  $m \in M$  such that  $L_m \subset L_x$ . Consider  $I_x m$ . Since clearly  $L_x \subset I_x$  whence  $L_m \subset I_x$ , it follows that  $I_x/L_m \cong I_x m$ . On the other hand,  $I_x m$  is a submodule of the Noetherian module  $Rm$ . Hence  $I_x/L_m$  is finitely generated, i.e., there exist a finite number of elements  $\lambda_1, \lambda_2, \dots, \lambda_n$  of  $I_x$  such that

$$I_x = R\lambda_1 + R\lambda_2 + \dots + R\lambda_n + L_m.$$

It follows therefore  $I_x x_\alpha = R\lambda_1 x_\alpha + R\lambda_2 x_\alpha + \dots + R\lambda_n x_\alpha$  for all components  $x_\alpha$ . Since, however, for each  $i, \lambda_i x_\alpha = 0$  for almost all  $\alpha$ , it follows that  $I_x x_\alpha = 0$  for almost all  $\alpha$ , that is,  $x$  is special. Thus  $\bigoplus A_\alpha$  is  $M$ -injective by Theorem 2.4.

$\Rightarrow$ . Let  $Rm, m \in M$  be any cyclic submodule of  $M$ . Then  $R/L_m \cong Rm$ , and there is a (1-1) correspondence between the left ideals of  $R$  containing  $L_m$  and submodules of  $Rm$ . Thus in order to show that  $Rm$  is noetherian it is sufficient to prove that there is no properly ascending infinite sequence of ideals of  $R$  containing  $L_m$ . Suppose there exists an infinite sequence  $L_m \subset I_1 \subset I_2 \subset I_3 \subset \dots$  of ideals  $I_j$  with  $I_j \neq I_{j+1}$  for every  $j \geq 1$ . Let  $B_j = R/I_j, \eta_j: R \rightarrow B_j$  the canonical projection. Let  $A_j$  be the injective hull of  $B_j$ . Then each  $A_j$  is  $M$ -injective also. By assumption  $\exists$  an  $m \in M$  s.t.  $I_1 \supset L_m$ . The element  $x = (x_j)_{j \geq 1}$  of  $\prod_{j \geq 1} A_j$  where  $x_j = \eta_j(1)$  is clearly dominated by  $M$ . For any  $\lambda \in I_j$  we have  $\lambda x_k = 0$  for  $k \geq j$ . Hence  $I_j \subset I_x$  for all  $j \geq 1$ . Let  $\lambda_j$  be any element of  $I_{j+1}$  which is not in  $I_j$ . Then  $\lambda_j x_j \neq 0$  and  $\lambda_j \in I_x$ . This proves that  $I_x x_j \neq 0$  for every  $j \geq 1$ . This means  $x$  is not a special element and hence by theorem 2.4,  $\bigoplus_{j \geq 1} A_j$  is not  $M$ -injective. This proves the implication  $\Rightarrow$ .

**REMARK 2.6.** A result of H. Bass [2] asserts that arbitrary direct sums of injective modules over  $R$  are injective  $\Leftrightarrow R$  is noetherian. Theorem 2.5 is a generalization of this result of H. Bass. When  $M = R$  we get the result of Bass.

**THEOREM 2.7.** *Suppose  $\{A_\alpha\}_{\alpha \in J}$  is a family of  $R$ -modules such that for every countable subset  $K$  of  $J, \bigoplus_{\alpha \in K} A_\alpha$  is  $M$ -injective. Then  $\bigoplus_{\alpha \in J} A_\alpha$  is itself  $M$ -injective.*

*Proof.* Assume that  $\bigoplus_{\alpha \in J} A_\alpha$  is not  $M$ -injective. Then, by Theorem 2.4, there exists an  $x \in \prod_{\alpha \in J} A_\alpha$  which is dominated by  $M$  but is not special, i.e.,  $I_x x_\alpha \neq 0$  for infinitely many  $\alpha \in J$ . Let  $K$  be

an infinite countable subset of the infinite set  $\{\alpha \in J \mid I_\alpha x_\alpha \neq 0\}$ . Let  $\mathbf{y}$  be element of  $\prod_{\alpha \in K} A_\alpha$  whose  $\alpha$ -component  $y_\alpha$  is equal to  $x_\alpha$  for all  $\alpha \in K$ . Then clearly  $I_x \subset I_y$ , so that it follows that  $\mathbf{y}$  is dominated by  $M$  and  $I_y y_\alpha = I_y x_\alpha \neq 0$  for all  $\alpha \in K$ . This implies again by Theorem 2.4 that  $\bigoplus_{\alpha \in K} A_\alpha$  is not  $M$ -injective (because each  $A_\alpha$  is  $M$ -injective by the assumption of our theorem). This is a contradiction, and so the proof is completed.
