The series of papers [2], [3], and [4] contains a number of errors, most of which deriving from a mis-statement in [5]. The subalgebra A of B in [5] 1.4.ii must be in addition a left ideal. Thus, assertion (4) and Theorem 6 of [2] are only valid in the case that A is a left ideal as well.

A second major problem is Theorem 1 of [1]. The proof to this theorem is false and the author has not been able to rectify it. For compact groups, Theorem 1 is trivial and, for unimodular groups G with $p \leq 2$, easy to prove. For this reason, and because we shall need the following theorems and corollary, we shall make the additional assumption *that G has equivalent left and right uniform structures and $p \leq 2$.*

THEOREM 1. *The closed right ideal in $L_1(G)$ generated by the center $L_1(G)^z$ of $L_1(G)$ is just $L_1(G)$.*

Proof. Note that G , being a SIN group, is unimodular. Let Q be the family of compact neighborhoods of the identity invariant under inner automorphisms. Then, for $V \in Q$ and $t, x \in G$,

$$t^{-1}x \in V \text{ if and only if } xt^{-1} = x(t^{-1}x)x^{-1} \in xVx^{-1} = V$$

so that $\hat{\xi}_V(t^{-1}x) = \hat{\xi}_V(xt^{-1})$, $\hat{\xi}_V$ being the set-theoretic characteristic function of V . Thus, for all $V \in Q$, $x \in G$, and $f \in L_1(G)$,

$$f * \hat{\xi}_V(x) = \int f(t)\hat{\xi}_V(t^{-1}x)dt = \int f(t)\hat{\xi}_V(xt^{-1})dt = \hat{\xi}_V * f(x).$$

Thus, $\{\hat{\xi}_V : V \in Q\} \subset L_1(G)^z$.

Assume that A is not dense in $L_1(G)$. Then there exists some nonzero function $h \in L_\infty(G)$ such that

$$(1) \quad \int hgd\lambda = 0 \text{ for all } g \in A.$$

Choose a compact subset E of G and a nonzero complex number α such that $\lambda(E) > 0$ and

$$|h(x) - \alpha| < \frac{|\alpha|}{3} \text{ for all } x \in E.$$

The net $\{\xi_V/\lambda(V)\}_{V \in Q}$, Q directed by inclusion, is an approximate identity for $L_1(G)$. Hence, there exists a sequence $\{V(n)\}_{n=1}^\infty$ in Q such that

$$\lim_n \|\xi_{(E^{-1}) * \xi_{V(n)}}/\lambda(V(n)) - \xi_{(E^{-1})}\|_1 = 0.$$

By choosing a subsequence is necessary, it may also be assumed that $\xi_{(E^{-1}) * \xi_{V(n)}}(x)/\lambda(V(n))$ converges to $\xi_{(E^{-1})}(x)$ for λ -almost all x . If $x^{-1} \in E^{-1}$ is a point of convergence, then

$$\begin{aligned} 1 &= \xi_{(E^{-1})}(x^{-1}) = \lim_n \xi_{(E^{-1}) * \xi_{V(n)}}(x)/\lambda(V(n)) \\ &= \lim_n \frac{1}{\lambda(V(n))} \int \xi_{(E^{-1})}(t) \xi_{V(n)}(t^{-1}x^{-1}) dt \\ &= \lim_n \frac{1}{\lambda(V(n))} \lambda(E^{-1} \cap x^{-1}V(n)^{-1}) = \lim_n \frac{\lambda(E \cap V(n)x)}{\lambda(V(n))}. \end{aligned}$$

Thus, there exists $V \in Q$ such that

$$\lambda(V) < \left(1 + \frac{|\alpha|}{3 \|h\|_\infty}\right) \lambda(E \cap Vx).$$

We have $\xi_{Vx} \in A$ and

$$\begin{aligned} \left| \int h \xi_{Vx} d\lambda \right| &\geq \left| \int_{Vx \cap E} h d\lambda \right| - \left| \int_{Vx \cap E'} h d\lambda \right| \\ &\geq \left| \int_{Vx \cap E} \alpha d\lambda \right| - \left| \int_{Vx \cap E} \frac{|\alpha|}{3} d\lambda \right| - \lambda(Vx \cap E') \|h\|_\infty \\ &\geq |\alpha| \lambda(Vx \cap E) - \lambda(Vx \cap E) \frac{|\alpha|}{3} - \lambda(Vx \cap E) \frac{|\alpha|}{3 \|h\|_\infty} \|h\|_\infty \\ &= \lambda(Vx \cap E) \frac{|\alpha|}{3} > 0. \end{aligned}$$

This contradicts (1). Hence A is dense in $L_1(G)$.

THEOREM 1'. *Let G be a locally compact SIN group. Then the closed left ideal in $L_1(G)$ generated by $L_1(G)^*$ is $L_1(G)$.*

Proof. The proof is analogous to that of Theorem 1.

THEOREM 2. *Let G be a SIN group and $p \in [1, \infty[$. Let W_p be the unit ball of the Banach algebra of right multipliers of type (p, p) , and B_p be the unit ball, of $L_p(G)$. Then, if $\{h_\beta\}$ is a bounded right approximate identity for $L_1(G)$ and $h \in L_1(G)$,*

$$\limsup_{\beta} \{ \| T(g*h)*h_{\beta} - T(g*h) \|_p : g \in B_p, T \in W_p \} = 0 .$$

Proof. Let b be a bound for the numbers $\|h_{\beta}\|_1$ and d a positive number. Choose $f, q \in C_{\infty}(G)$ such that

$$\| f*q - h \|_1 < \frac{d}{3(1+b)} .$$

Theorem 1' implies that there exist $\{f_j\}_{j=1}^n \subset L_1(G)^z$ and $\{x_j\}_{j=1}^n \subset G$ such that

$$\left\| f - \sum_{j=1}^n x_j f_j \right\|_1 < \frac{d}{3(1+b)\|q\|_1} .$$

Choose an index B_0 such that, for all $\beta > \beta_0$ and $j = 1, 2, \dots, n$,

$$\| f_j - f_j*h_{\beta} \|_1 < \frac{d}{3n\|q\|_1} .$$

For all $\beta > \beta_0, g \in B_p$, and $T \in W_p$, we have

$$\begin{aligned} & \| T(g*h)*h_{\beta} - T(g*h) \|_p \\ & \leq \| g*f*T(q)*h_{\beta} - g*f*T(q) \|_p + (1+b)\frac{d}{3(1+b)} \\ & \leq \left\| \sum_{j=1}^n g*x_j*f_j*T(q)*h_{\beta} - g*x_j*f_j*T(q) \right\|_p \\ & \quad + (1+b)\|q\|_1 d/[3(1+b)\|q\|_1] + \frac{d}{3} \\ & \leq \sum_{j=1}^n \| g*x_j*T(q)*f_j*h_{\beta} - g*x_j*T(q)*f_j \|_p + \frac{d}{3} + \frac{d}{3} \\ & \leq \sum_{j=1}^n \| g \|_p \| q \|_1 \| f_j*h_{\beta} - f_j \|_1 + \frac{d}{3} + \frac{d}{3} \leq \frac{d}{3} + \frac{d}{3} + \frac{d}{3} = d . \end{aligned}$$

COROLLARY. Let T be a right multiplier of type (p, p) and let $\{h_{\beta}\}$ be as in Theorem 2. Then the nets $\{W_{h_{\beta}} \circ T \circ W_{h_{\beta}}\}, \{W_{h_{\beta}} \circ T\},$ and $\{T \circ W_{h_{\beta}}\}$ all converge to T in the topology $\mathfrak{K}(\mathfrak{M}_p, \mathfrak{A}_p)$.

Proof. That $\{T \circ W_{h_{\beta}}\}$ converges to T follows from Theorem 3 of [1]. That $\{W_{h_{\beta}} \circ T\}$ converges to T follows from Theorem 2. Thus, for all $V \in \mathfrak{A}_p$,

$$\begin{aligned} & \overline{\lim}_{\beta} \| (W_{h_{\beta}} \circ T \circ W_{h_{\beta}} - T) \circ V \| \\ & \leq \lim (\| W_{h_{\beta}} \| \| (T \circ W_{h_{\beta}} - T) \circ V \| + \| (W_{h_{\beta}} \circ T - T) \circ V \|) = 0 . \end{aligned}$$

We now return to the papers [1], [2], and [3]. Evidently, under our new assumptions, Theorems 1, 2, 3, 4, 5, the corollary to Theorem

4, and Lemma 2 of [1] are still true as stated. The same holds true for all the lemmas, propositions, and theorems of [2], and for Lemma 2 of [3].

Lemma 1 of [1], which depends on (4) can be repaired by applying to the corollary to Theorem 2 above instead. The assertion (6) of [3] is now a special case of the corollary of Theorem 2 above. Lemmas 1 and 2, Theorems 1 and 2, and Corollaries 1 and 2 of [3] all depend, either directly or derivatively on (6). Theorem 7 of [1] depends on the corollary to Theorem 2 above and Theorem 6 of [1]; but Corollary 1 of [3] implies that \mathfrak{A}_p is a left ideal in \mathfrak{M}_p and so Theorem 6 of [1] may be validly applied. Proposition 1 of [3] depends on Theorem 7 of [1] and Theorem 3 of [3] on Proposition 1.

The one last correction we note here is that f and h should be interchanged in the right side of the equation defining convolution at the beginning of [2].

Correction to

“ a^* -CLOSURES TO COMPLETELY DISTRIBUTIVE LATTICE-ORDERED GROUPS”

A. M. W. GLASS, W. CHARLES HOLLAND AND
STEPHEN H. MCCLEARY

Volume 59 (1975), 43-67

The converse direction of Theorem 5.1 (see Pacific Journal of Mathematics, 59 (No. 1), 1975) is easily seen to be false. The proof is complete nonsense as Proposition 5.2 does not apply. However, the converse direction of Theorem 5.1 is true under the added assumption that (H, T) also has closed stabilizers. Moreover, wherever this direction of Theorem 5.1 has been used in the rest of the paper, the extra hypothesis is available (often courtesy of Proposition 5.2), so the remainder of the paper requires no change.

The Supporting Institutions listed above contribute to the cost of publication of this Journal, but they are not owners or publishers and have no responsibility for its content or policies.

Mathematical papers intended for publication in the *Pacific Journal of Mathematics* should be in typed form or offset-reproduced, (not dittoed), double spaced with large margins. Please do not use built up fractions in the text of your manuscript. You may however, use them in the displayed equations. Underline Greek letters in red, German in green, and script in blue. The first paragraph or two must be capable of being used separately as a synopsis of the entire paper. Items of the bibliography should not be cited there unless absolutely necessary, in which case they must be identified by author and Journal, rather than by item number. Manuscripts, in triplicate, may be sent to any one of the editors. Please classify according to the scheme of Math. Reviews, Index to Vol. **39**. All other communications should be addressed to the managing editor, or Elaine Barth, University of California, Los Angeles, California, 90024.

The Pacific Journal of Mathematics expects the author's institution to pay page charges, and reserves the right to delay publication for nonpayment of charges in case of financial emergency.

100 reprints are provided free for each article, only if page charges have been substantially paid. Additional copies may be obtained at cost in multiples of 50.

The *Pacific Journal of Mathematics* is issued monthly as of January 1966. Regular subscription rate: \$72.00 a year (6 Vols., 12 issues). Special rate: \$36.00 a year to individual members of supporting institutions.

Subscriptions, orders for back numbers, and changes of address should be sent to Pacific Journal of Mathematics, 103 Highland Boulevard, Berkeley, California, 94708.
