**WIENER INTEGRALS OVER THE SETS BOUNDED BY
SECTIONALLY CONTINUOUS BARRIERS**

CHULL PARK AND DAVID LEE SKOUG

WIENER INTEGRALS OVER THE SETS BOUNDED BY SECTIONALLY CONTINUOUS BARRIERS

C. PARK AND D. L. SKOUG

Let $C_w \equiv C[0, T]$ denote the Wiener space on $[0, T]$. The Wiener integrals of various functionals $F[x]$ over the space C_w are well-known. In this paper we establish formulas for the Wiener integrals of $F[x]$ over the subsets of C_w bounded by sectionally continuous functions.

1. Introduction. Let $C_w \equiv C[0, T]$ be the Wiener space on $[0, T]$, i.e., the space of all real-valued continuous functions on $[0, T]$ vanishing at the origin. The standard Wiener process $\{X(t) \equiv X(t, \cdot): 0 \leq t \leq T\}$ and C_w are related by $X(t, x) = x(t)$ for each x in C_w . Evaluation formulas for the Wiener integral

$$\int_{C_w} F[x] d_w x \equiv E\{F[x]\}$$

of various functionals $F[x]$ are of course well-known (for example see [7] for some of these formulas). Now, consider sets of the type

$$\begin{aligned} \Gamma_f &\equiv \left\{ \sup_{0 \leq t \leq T} X(t) - f(t) < 0 \right\} \\ &= \left\{ x \in C_w: \sup_{0 \leq t \leq T} x(t) - f(t) < 0 \right\} \end{aligned}$$

where $f(t)$ is sectionally continuous on $[0, T]$ and $f(0) \geq 0$.

It is well-known that for $b \geq 0$

$$P[\Gamma_b] = 2\Phi(bT^{-1/2}) - 1$$

and

$$P[\Gamma_{a+b}] = \Phi[(aT + b)T^{-1/2}] - e^{-2ab} \Phi[(aT - b)T^{-1/2}]$$

where Φ is the standard normal distribution function. In [3], [5], and [6] more general functions $f(t)$ are considered and formulas given for the probabilities of the sets Γ_f .

The main purpose of this paper is to derive formulas for Wiener integrals over the sets Γ_f . In §2 we state and prove the main results, while in §3 we discuss some applications and examples.

2. Integration formulas. Our first theorem is preliminary; it plays a key role in the proof of Theorem 2.

THEOREM 1. *Let $0 = t_0 < t_1 < \cdots < t_n = T$ be a partition of $[0, T]$. For $j = 1, 2, \cdots, n$ let $f_j(t)$ be continuous on $[t_{j-1}, t_j]$. Then the conditional probability*

$$\begin{aligned} P & \left[\sup_{t_{j-1} \leq t \leq t_j} X(t) - f_j(t) < 0, 1 \leq j \leq n \mid X(t_j) = u_j, 1 \leq j \leq n \right] \\ & = \prod_{j=1}^n P \left[\sup_{0 \leq t \leq \Delta t_j} X(t) - \{f_j(t + t_{j-1}) - u_{j-1}\} < 0 \mid X(\Delta t_j) = \Delta u_j \right] \\ & = \prod_{j=1}^n P \left(\sup_{0 \leq t < \infty} X(t) - \left\{ \frac{t + t \Delta t_j}{\Delta t_j} \left[f_j \left(\frac{\Delta t_j}{1 + t \Delta t_j} + t_{j-1} \right) - u_{j-1} \right] - \frac{\Delta u_j}{\Delta t_j} \right\} < 0 \right) \end{aligned}$$

where $\Delta t_j = t_j - t_{j-1}$ and $\Delta u_j = u_j - u_{j-1}$ with $u_0 = 0$.

Proof. First we note that

$$\begin{aligned} P & \left[\sup_{t_{j-1} \leq t \leq t_j} X(t) - f_j(t) < 0, 1 \leq j \leq n \mid X(t_j) = u_j, 1 \leq j \leq n \right] \\ & = P \left\{ \sup_{t_{j-1} \leq t \leq t_j} X(t) - X(t_{j-1}) - [f_j(t) - u_{j-1}] < 0, \right. \\ & \quad \left. 1 \leq j \leq n \mid X(t_j) - X(t_{j-1}) = \Delta u_j, 1 \leq j \leq n \right\}. \end{aligned}$$

Now since the Wiener process has independent increments, the above expression equals

$$\prod_{j=1}^n P \left\{ \sup_{t_{j-1} \leq t \leq t_j} X(t) - X(t_{j-1}) - [f_j(t) - u_{j-1}] < 0 \mid X(t_j) - X(t_{j-1}) = \Delta u_j \right\}.$$

Hence the first equality in the theorem follows from the fact that stationarity implies that $X(t) - X(t_{j-1})$ is the same process as $X(t - t_{j-1})$. To prove the second equality in the theorem, we note that $X(t)$ and $tX(1/t)$ are identical Wiener processes for $t > 0$ by checking the covariance function. Thus

$$\begin{aligned} P & \left\{ \sup_{0 \leq t \leq \Delta t_j} X(t) - [f_j(t + t_{j-1}) - u_{j-1}] < 0 \mid X(\Delta t_j) = \Delta u_j \right\} \\ & = P \left\{ \sup_{0 < t \leq \Delta t_j} X \left(\frac{1}{t} \right) - \frac{1}{t} [f_j(t + t_{j-1}) - u_{j-1}] < 0 \mid X \left(\frac{1}{\Delta t_j} \right) = \frac{\Delta u_j}{\Delta t_j} \right\} \\ & = P \left\{ \sup_{0 < t \leq \Delta t_j} X \left(\frac{1}{t} \right) - X \left(\frac{1}{\Delta t_j} \right) - \frac{1}{t} [f_j(t + t_{j-1}) - u_{j-1}] + \frac{\Delta u_j}{\Delta t_j} < 0 \right\}. \end{aligned}$$

The result now follows by the transformation

$$t^{-1} - (\Delta t)^{-1} \rightarrow t.$$

THEOREM 2. *Let $0 = t_0 < t_1 < \dots < t_n = T$ be a partition of $[0, T]$. Let $g(u_1, \dots, u_n)$ be a Lebesgue measurable function on R^n and for $x \in C_w$ let $G[x] = g(x(t_1), \dots, x(t_n))$. For $j = 1, 2, \dots, n$ let $f_j(t)$ be a continuous function on $[t_{j-1}, t_j]$. Then the Wiener integral of $G[x]$ over the set*

$$\Gamma_f \equiv \left\{ x \in C_w : \sup_{t_{j-1} \leq t \leq t_j} x(t) - f_j(t) < 0, j = 1, 2, \dots, n \right\}$$

is given by

$$\int_{\Gamma_f} G[x] d_w x = \int_{-\infty}^{\lambda_1} \dots \int_{-\infty}^{\lambda_n} g(u_1, \dots, u_n) H(u_1, \dots, u_n) du_n \dots du_1$$

in the sense the existence of either side implies that of their equality, where

$$\lambda_j = \begin{cases} \min \{f_j(t_j), f_{j+1}(t_j)\}, & j = 1, 2, \dots, n - 1 \\ f_n(T), & j = n \end{cases}$$

$$f(t) = \begin{cases} f_j(t), & t_{j-1} < t < t_j, \quad j = 1, 2, \dots, n \\ f_1(0), & t = 0 \\ \lambda_j, & t = t_j, \quad j = 1, 2, \dots, n \end{cases},$$

and

$$H(u_1, \dots, u_n) = \prod_{j=1}^n (2\pi \Delta t_j)^{-1/2} \exp \left\{ -(\Delta u_j)^2 / (2\Delta t_j) \right\} \\ P \left[\sup_{0 \leq t \leq \Delta t_j} X(t) - \{f_j(t + t_{j-1}) - u_{j-1}\} < 0 \mid X(\Delta t_j) = \Delta u_j \right].$$

Proof. First consider the case where $G[x]$ is the characteristic function of a Wiener interval I . That is to say I has the form

$$I = \{x \in C_w \mid [x(t_1), \dots, x(t_n)] \in E\}$$

for some Lebesgue measurable set E in R^n . Then $G[x] = \chi_I(x) = \chi_E[x(t_1), \dots, x(t_n)]$ and so in this case

$$\begin{aligned} \int_{\Gamma_f} G[x] d_w x &= \int_{\Gamma_f} \chi_f(x) d_w x = P[\Gamma_f \cap I] \\ &= \int_{-\infty}^{\lambda_1} \cdot (n) \cdot \int_{-\infty}^{\lambda_n} P \left\{ \sup_{t_{j-1} \leq t \leq t_j} X(t) - f_j(t) < 0, 1 \leq j \leq n, \right. \\ &\quad \left. [x(t_1), \dots, x(t_n)] \in E \mid x(t_j) = u_j, 1 \leq j \leq n \right\} K(\vec{t}, \vec{u}) du_n \cdots du_1 \end{aligned}$$

where

$$K(\vec{t}, \vec{u}) \equiv \prod_{j=1}^n (2\pi \Delta t_j)^{-1/2} \exp \{ -(\Delta u_j)^2 / (2\Delta t_j) \}.$$

Next we observe that

$$\begin{aligned} P \left\{ \sup_{t_{j-1} \leq t \leq t_j} X(t) - f_j(t) < 0, 1 \leq j \leq n, [x(t_1), \dots, x(t_n)] \in E \mid \right. \\ \left. x(t_j) = u_j, 1 \leq j \leq n \right\} &= \chi_E(u_1, \dots, u_n) P \left[\sup_{t_{j-1} \leq t \leq t_j} X(t) - f_j(t) < 0, \right. \\ &\quad \left. 1 \leq j \leq n \mid x(t_j) = u_j, 1 \leq j \leq n \right]. \end{aligned}$$

Next, applying Theorem 1 to the last conditional probability above gives the desired result for this case. The general case follows by the usual arguments in integration theory.

THEOREM 3. *Let $f(t)$ be sectionally continuous on $[0, T]$ with $f(0) \geq 0$. Let $g(u_1, \dots, u_n)$ be a Lebesgue measurable function on R^n , and let $\alpha(t) \in BV[0, T]$. Then*

$$\begin{aligned} \int_{\Gamma_f} g[x(t_1), \dots, x(t_n)] e^{\int_0^T \alpha(t) dx(t)} d_w x \\ = e^{1/2 \int_0^T \alpha^2(t) dt} \int_{\Gamma_f(t) - \int_0^t \alpha(s) ds} g \left[x(t_1) + \int_0^{t_1} \alpha(s) ds, \dots, x(t_n) \right. \\ \left. + \int_0^{t_n} \alpha(s) ds \right] d_w x \end{aligned}$$

in the sense the existence of either side implies that of the other and their equality.

COROLLARY. *If f and α satisfy the conditions in Theorem 3, then*

$$\int_{\Gamma_f} e^{\int_0^T \alpha(t) dx(t)} d_w x = e^{1/2 \int_0^T \alpha^2(t) dt} P \left\{ \sup_{0 \leq t \leq T} X(t) - \left[f(t) - \int_0^t \alpha(s) ds \right] < 0 \right\}.$$

Proof (of Theorem 3). Using the Cameron–Martin translation theorem (see [1] or [7]) with the translation

$$x(t) \rightarrow x(t) + \int_0^t \alpha(u) du$$

we obtain

$$\begin{aligned} & \int_{\Gamma_t} g[x(t_1), \dots, x(t_n)] e^{\int_0^t \alpha(s) dx(s)} d_w x \\ &= e^{-1/2 \int_0^t \alpha^2(s) ds} \int_{\Gamma(t) - \int_0^t \alpha(s) ds} g \left[x(t_1) + \int_0^{t_1} \alpha(u) du, \dots, x(t_n) + \int_0^{t_n} \alpha(u) du \right] \\ & \cdot e^{\int_0^t \alpha(s) dx(s) + \int_0^t \alpha(s) du} e^{-\int_0^t \alpha(s) dx(s)} d_w x. \end{aligned}$$

The result now follows by simplifying the last expression.

THEOREM 4. Assume that $g(z) = \sum_0^\infty a_n z^n$ is an entire function such that for some M, N and $\gamma \in (0, 2)$, $|g(z)| \leq M \exp(N|z|^\gamma)$ for all complex numbers z . For some $r \in (2, \infty]$ and $b > 0$ assume that $\theta(t, u) \in L_1([0, T] \times (-\infty, b])$, i.e., $\int_{-\infty}^b |\theta(t, u)| du \in L_r[0, T]$. Then for any $\psi(u) \in L_1(-\infty, b] \cup L_\infty(-\infty, b]$,

$$(1) \quad \int_{\Gamma_b} g \left[\int_0^T \theta(t, x(t)) dt \right] \psi(x(T)) d_w x = \sum_0^\infty a_n J_n(T) n!$$

where for $n = 0, 1, 2, \dots$

$$\begin{aligned} J_n(T) &\equiv \int_0^{t_{n+1}} \cdot (n) \cdot \int_0^{t_2} \int_{-\infty}^b \cdot (n+1) \cdot \int_{-\infty}^b \psi(u_{n+1}) \prod_{j=1}^n \theta(t_j, u_j) \\ (2) \quad & \prod_{j=1}^{n+1} (2\pi \Delta t_j)^{-1/2} \exp \{ -(\Delta u_j)^2 / (2\Delta t_j) \} \\ & \cdot [1 - \exp \{ -2(b - u_{j-1})(b - u_j) / \Delta t_j \}] \\ & \cdot du_{n+1} \cdots du_1 dt_1 \cdots dt_n \end{aligned}$$

and where $u_0 \equiv 0$, and $0 = t_0 < t_1 < \dots < t_{n+1} = T$.

Proof. Proceeding formally we obtain

$$\begin{aligned} & \int_{\Gamma_b} g \left[\int_0^T \theta(t, x(t)) dt \right] \psi(x(T)) d_w x \\ &= \sum_0^\infty a_n \int_{\Gamma_b} \left[\int_0^T \theta(t, x(t)) dt \right]^n \psi(x(T)) d_w x. \end{aligned}$$

But for $n = 1, 2, \dots$

$$\begin{aligned}
& \int_{\Gamma_b} \left[\int_0^T \theta(t, x(t)) dt \right]^n \psi(x(T)) d_w x \\
&= \int_{\Gamma_b} \left[\int_0^T \cdot (n) \cdot \int_0^T \prod_{j=1}^n \theta(t_j, x(t_j)) dt_1 \cdots dt_n \right] \psi(x(T)) d_w x \\
&= n! \int_0^{t_{n+1}} \cdot (n) \cdot \int_0^{t_2} \left[\int_{\Gamma_b} \psi(x(t_{n+1})) \prod_{j=1}^n \theta(t_j, x(t_j)) d_w x \right] dt_1 \cdots dt_n \\
&= n! \int_0^{t_{n+1}} \cdot (n) \cdot \int_0^{t_2} \int_{-\infty}^b \cdot (n+1) \cdot \int_{-\infty}^b \psi(u_{n+1}) \prod_{j=1}^n \theta(t_j, u_j) \prod_{j=1}^{n+1} \{(2\pi \Delta t_j)^{-1/2} \\
&\quad \cdot \exp[-(\Delta u_j)^2 / (2\Delta t_j)] [1 - \exp(-2(b - u_{j-1})(b - u_j) / \Delta t_j)]\} \\
&\quad \cdot du_{n+1} \cdots du_1 dt_1 \cdots dt_n
\end{aligned}$$

where the last equality above is obtained using Theorem 2, Theorem 1, and the fact that

$$\begin{aligned}
P \left(\sup_{0 \leq t < \infty} X(t) - \{(b_j - u_{j-1})t + (b_j - u_j) / \Delta t_j\} < 0 \right) \\
= 1 - \exp[-2(b - u_{j-1})(b - u_j) / \Delta t_j].
\end{aligned}$$

Thus proceeding formally we have obtained equation (1). The Theorem follows readily once the absolute convergence of the series

$$\sum_0^{\infty} n! a_n J_n(T)$$

is established.

Recall that $r \in (2, \infty]$. We will establish the absolute convergence when $2 < r < \infty$ and $\psi \in L_1(-\infty, b]$; then other cases are similar, but easier. Let p satisfy $1/r + 1/p = 1$. Then $1 < p < 2$ and by Hölder's inequality we obtain

$$\begin{aligned}
|J_n(T)| &\leq \|\psi\|_1 \int_0^{t_{n+1}} \cdot (n) \cdot \int_0^{t_2} \prod_{j=1}^n \|\theta(t_j, \cdot)\|_1 \prod_{j=1}^{n+1} (2\pi \Delta t_j)^{-1/2} dt_1 \cdots dt_n \\
&\leq \|\psi\|_1 \left\{ \int_0^{t_{n+1}} \cdot (n) \cdot \int_0^{t_2} [t_1(t_2 - t_1) \cdots (t_{n+1} - t_n)]^{-p/2} dt_1 \cdots dt_n \right\}^{1/p} \\
&\quad \cdot \left\{ \int_0^{t_{n+1}} \cdot (n) \cdot \int_0^{t_2} \prod_{j=1}^n \|\theta(t_j, \cdot)\|_1^r dt_1 \cdots dt_n \right\}^{1/r} (2\pi)^{-(n+1)/2}.
\end{aligned}$$

But

$$\begin{aligned} & \left\{ \int_0^{t_{n+1}} \cdot (n) \cdot \int_0^{t_2} \prod_{j=1}^n \|\theta(t_j, \cdot)\|_1^r dt_1 \cdots dt_n \right\}^{1/r} \\ &= \left\{ \frac{1}{n!} \int_0^T \cdot (n) \cdot \int_0^T \prod_{j=1}^n \|\theta(t_j, \cdot)\|_1^r dt_1 \cdots dt_n \right\}^{1/r} \\ &= \left(\frac{1}{n!}\right)^{1/r} \left(\int_0^T \|\theta(t, \cdot)\|_1^r dt\right)^{n/r} \\ &= \left(\frac{1}{n!}\right)^{1/r} \|\theta\|_1^{n/r}. \end{aligned}$$

In addition

$$\begin{aligned} & \int_0^{t_{n+1}} \cdot (n) \cdot \int_0^{t_2} [t_1(t_2 - t_1) \cdots (t_{n+1} - t_n)]^{-p/2} dt_1 \cdots dt_n \\ &= \frac{T^{n(2-p)/2} \{\Gamma(1 - p/2)\}^{n+1}}{T^{p/2} \Gamma[(n + 1)(1 - p/2)]} \end{aligned}$$

where $\Gamma(z)$ denotes the Gamma function.

Thus the series $\sum_0^\infty |a_n J_n(T)| n!$ is dominated by the series

$$\begin{aligned} (3) \quad & \sum_0^\infty \frac{n! |a_n| (n!)^{-1/r} \|\theta\|_1^n T^{n(2-p)/2p} \{\Gamma(1 - p/2)\}^{(n+1)/p}}{T^{1/2} \{\Gamma[(n + 1)(1 - p/2)]\}^{1/p}} \\ &= \sum_0^\infty \frac{|a_n| \|\theta\|_1^n T^{n(2-p)/2p} \{\Gamma(1 - p/2)\}^{(n+1)/p}}{T^{1/2}} \left\{ \frac{n!}{\Gamma[(n + 1)(1 - p/2)]} \right\}^{1/p}. \end{aligned}$$

But since $g(z)$ is an entire function of order at most γ we know that

$$\limsup_{n \rightarrow \infty} \left(\frac{n \ln n}{-\ln |a_n|} \right) \leq \gamma < \frac{\gamma + 2}{2}$$

and so for n sufficiently large we obtain that

$$|a_n| < n^{-2n/(\gamma+2)}.$$

But $\Gamma(z) = z^{z-1/2} e^{-z} (2\pi)^{1/2} (1 + O(1))$ and hence for positive z sufficiently large

$$\frac{1}{\Gamma(z)} < \frac{2e^z z^{1/2}}{(2\pi)^{1/2} z^z}.$$

Also by Stirling's formula

$$n! \cong (n/e)^n (2\pi n)^{1/2} \exp\left(\frac{1}{12n}\right).$$

Thus for n sufficiently large we obtain

$$(4) \quad |a_n| \left\{ \frac{n!}{\Gamma[(n+1)(1-p/2)]} \right\}^{1/p} \\ \cong 2^{1/p} \exp\left(\frac{12n+1}{12np}\right) n^{1/2} e^{-(n+1)/2} \left(\frac{2}{2-p}\right) \\ \times [(n+1)(2-p) - 1] / 2p n^{-n(2-\gamma)/2(\gamma+2)}.$$

Now using inequality (4) the convergence of the series (3) follows by the root test.

COROLLARY 1. *Let $\theta(t, u)$ be as in Theorem 4. Then*

$$\int_{\Gamma_b} \exp\left[\int_0^T \theta(s, x(s)) ds\right] d_w x = \sum_0^\infty J_n(T)$$

where $J_n(T)$ is given by (2) with $\psi \equiv 1$.

COROLLARY 2. *Let $\alpha(t)$ be of bounded variations on $[0, T]$. Then for any $b > 0$,*

$$\int_{\Gamma_b} e^{\int_0^T \alpha(t) dx(t)} d_w x = \sum_0^\infty (-1)^n K_n(T)$$

where

$$(5) \quad K_n(T) \equiv \int_0^{t_{n+1}} \cdot (n) \cdot \int_0^{t_2} \int_{-\infty}^b \cdot (n+1) \cdot \int_{-\infty}^b e^{\alpha(T)u_{n+1}} \prod_{j=1}^n u_j \prod_{j=1}^{n+1} (2\pi \Delta t_j)^{-1/2} \\ \cdot \exp[-(\Delta u_j)^2 / (2\Delta t_j)] \{1 - \exp[-2(b - u_{j-1})(b - u_j) / \Delta t_j]\} \\ \cdot du_{n+1} \cdots du_1 d\alpha(t_1) \cdots d\alpha(t_n).$$

Proof (of Corollary 2). The Corollary follows quite readily once the absolute convergence of the series $\sum_0^\infty (-1)^n K_n(T)$ is established. Now proceeding formally we see that

$$\int_{\Gamma_b} e^{\int_0^T \alpha(t) dx(t)} d_w x = \int_{\Gamma_b} e^{\alpha(T)x(T) - \int_0^T x(t) d\alpha(t)} d_w x \\ = \int_{\Gamma_b} \sum_{n=0}^\infty \frac{(-1)^n}{n!} e^{\alpha(T)x(T)} \left[\int_0^T x(t) d\alpha(t) \right]^n d_w x$$

and so

$$|K_n(T)| = \left| \frac{1}{n!} \int_{\Gamma_b} e^{\alpha(T)x(T)} \left[\int_0^T x(t) d\alpha(t) \right]^n d_w x \right|$$

$$\leq \frac{1}{n!} \int_{C_w} e^{\alpha(T)x(T)} \left| \int_0^T x(t) d\alpha(t) \right|^n d_w x.$$

Thus

$$\sum_0^\infty |K_n(T)| \leq \sum_0^\infty \frac{1}{n!} \int_{C_w} e^{\alpha(T)x(T)} \left| \int_0^T x(t) d\alpha(t) \right|^n d_w x$$

$$= \int_{C_w} e^{\alpha(T)x(T)} e^{|\int_0^T x(t) d\alpha(t)|} d_w x$$

$$\leq \int_{C_w} e^{2|\alpha(T)x(T)|} e^{|\int_0^T \alpha(t) dx(t)|} d_w x$$

$$\leq \left[\int_{C_w} e^{4|\alpha(T)x(T)|} d_w x \right]^{1/2} \left[\int_{C_w} e^{2|\int_0^T \alpha(t) dx(t)|} d_w x \right]^{1/2}$$

$$< \infty \quad \text{since } \alpha(t) \in L^2[0, T].$$

3. Applications and examples.

A. *Application 1.* For our first application we obtain a formula for the probability that a Wiener path always stays below the broken line segments $f_j(t) = a_j t + b_j$, $t_{j-1} \leq t \leq t_j$, $1 \leq j \leq n$, where $b_1 > 0$. Using Theorems 1 and 2 we obtain

$$P \left[\sup_{t_{j-1} \leq t \leq t_j} X(t) - (a_j t + b_j) < 0, 1 \leq j \leq n \right]$$

$$= \int_{-\infty}^{\lambda_1} \cdot (n) \cdot \int_{-\infty}^{\lambda_n} \prod_{j=1}^n P \left(\sup_{0 \leq t < \infty} X(t) - \left\{ \frac{1+t\Delta t_j}{\Delta t_j} \left[a_j \left(\frac{\Delta t_j}{1+t\Delta t_j} + t_{j-1} \right) \right. \right. \right.$$

$$\left. \left. + b_j - u_{j-1} \right] - \frac{\Delta u_j}{\Delta t_j} \right\} < 0 \right) K(\vec{t}, \vec{u}) du_n \cdots du_1$$

where

$$\lambda_j = \begin{cases} \min \{a_j t_j + b_j, a_{j+1} t_j + b_{j+1}\}, & 1 \leq j < n \\ a_n T + b_n, & j = n \end{cases}$$

and

$$K(\vec{t}, \vec{u}) = \prod_{j=1}^n (2\pi \Delta t_j)^{-1/2} \exp\{- (\Delta u_j)^2 / (2\Delta t_j)\}.$$

But the probability in the integrand simplifies into

$$P\left(\sup_{0 \leq t < \infty} X(t) - \{(a_j t_{j-1} + b_j - u_{j-1})t + (a_j t_j + b_j - u_j) / \Delta t_j\} < 0\right)$$

which, using Doob [2, p. 397], equals the expression

$$[1 - \exp\{-2(a_j t_{j-1} + b_j - u_{j-1})(a_j t_j + b_j - u_j) / \Delta t_j\}].$$

Thus, we finally obtain the formula

$$\begin{aligned} & P\left[\sup_{t_{j-1} \leq t \leq t_j} X(t) - (a_j t + b_j) < 0, 1 \leq j \leq n\right] \\ &= \int_{-\infty}^{\lambda_1} \cdot (n) \cdot \int_{-\infty}^{\lambda_n} \prod_{j=1}^n [1 - \exp\{-2(a_j t_{j-1} + b_j - u_{j-1})(a_j t_j + b_j - u_j) / \Delta t_j\}] \\ & \quad \cdot [2\pi \Delta t_j]^{-1/2} \exp\{- (\Delta u_j)^2 / (2\Delta t_j)\} du_n \cdots du_1. \end{aligned}$$

B. Example 1. For $j = 1, 2, \dots, n$ let the a_j and b_j be as above. Let

$$E \equiv \left\{x \in C_w \mid \sup_{t_{j-1} \leq t \leq t_j} X(t) - (a_j t + b_j) < 0, 1 \leq j \leq n\right\}.$$

Let $g(u_1, \dots, u_n)$ be Lebesgue measurable on R^n . Then

$$\begin{aligned} & \int_E g(x(t_1), \dots, x(t_n)) d_w x \\ &= \int_{-\infty}^{\lambda_1} \cdot (n) \cdot \int_{-\infty}^{\lambda_n} g(u_1, \dots, u_n) \prod_{j=1}^n [2\pi \Delta t_j]^{-1/2} \exp\{- (\Delta u_j)^2 / (2\Delta t_j)\} \\ & \quad \cdot \prod_{j=1}^n [1 - \exp\{-2(a_j t_{j-1} + b_j - u_{j-1})(a_j t_j + b_j - u_j) / \Delta t_j\}] du_n \cdots du_1 \end{aligned}$$

in the sense the existence of either side implies that of the other and their equality.

C. Application 2. Assume $\alpha(t)$ is of bounded variation on $[0, T]$ and let $f(t) \equiv \int_0^t \alpha(s) ds$. For $b > 0$ we want to find the probability of the set

$$\Gamma_{f(\cdot)+b} = \left\{ \sup_{0 \leq t \leq T} X(t) - f(t) < b \right\}.$$

First, using the Corollary to Theorem 3, we have that

$$P [\Gamma_{f(\cdot)+b}] = e^{-1/2 \int_0^T \alpha^2(t) dt} \int_{\Gamma_b} e^{-\int_0^T \alpha(t) dx(t)} d_w x.$$

Next, using Corollary 2 of Theorem 4, we obtain

$$P[\Gamma_{f(\cdot)+b}] = e^{-1/2 \int_0^T \alpha^2(t) dt} \sum_{n=0}^{\infty} K_n(T)$$

where $K_n(T)$ is given by equation (5). This expression is an entirely different series expansion of the probability than the ones given by Park and Paranjape in [5].

D. Application 3. The Corollary to Theorem 3 is also useful to evaluate integrals of the type

$$\int_{\Gamma_f} e^{\int_0^T \alpha(t) dx(t)} d_w x$$

numerically for given $\alpha(t)$, $f(t)$, and T . By the Corollary, the above integral is equal to

$$e^{1/2 \int_0^T \alpha^2(t) dt} P \left\{ \sup_{0 \leq t \leq T} X(t) - \left[f(t) - \int_0^t \alpha(s) ds \right] < 0 \right\},$$

and the last probability can be evaluated numerically using the Park-Schuermann method [6].

The following table was computed by an IBM/168 with the unit interval divided into 2^9 equal subintervals.

Estimates of $\int_{\Gamma_f} e^{\int_0^T \alpha(t) dx(t)} d_w x$				
$\alpha(t)$	$\sin t$	e^t	t	\sqrt{t}
$f(t)$	$t + 1$	$t^2 + t + 1$	$\cos t$	$\ln(t + 1) + 1$
The integral	.976414	3.729278	.467819	.939285

AMERICAN MATHEMATICAL SOCIETY

The Supporting Institutions listed above contribute to the cost of publication of this Journal, but they are not owners or publishers and have no responsibility for its contents or policies.

Mathematical papers intended for publication in the *Pacific Journal of Mathematics* should be in typed form or offset-reproduced (not dittoed), double spaced with large margins. Underline Greek letters in red, German in green, and script in blue. The first paragraph or two must be capable of being used separately as a synopsis of the entire paper. Items of the bibliography should not be cited there unless absolutely necessary, in which case they must be identified by author and Journal, rather than by item number. Manuscripts, in duplicate, may be sent to any one of the four editors. Please classify according to the scheme of Math. Reviews, Index to Vol. 39. All other communications should be addressed to the managing editor, or Elaine Barth, University of California, Los Angeles, California, 90024.

100 reprints are provided free for each article, only if page charges have been substantially paid. Additional copies may be obtained at cost in multiples of 50.

The *Pacific Journal of Mathematics* is issued monthly as of January 1966. Regular subscription rate: \$72.00 a year (6 Vols., 12 issues). Special rate: \$36.00 a year to individual members of supporting institutions.

Subscriptions, orders for back numbers, and changes of address should be sent to Pacific Journal of Mathematics, 103 Highland Boulevard, Berkeley, California, 94708.
