THE FURSTENBERG STRUCTURE THEOREM

ROBERT ELLIS
The Furstenberg structure theorem for minimal distal flows is proved without any countability assumptions. Thus let $(X, T)$ be a distal flow with compact Hausdorff phase space $X$ and phase group $T$. Then there exists an ordinal $\nu$ and a family of flows $(X_\alpha)_{\alpha \leq \nu}$ such that $X_0$ is the one point flow, $X_1 = X$, $X_{\alpha+1}$ is an almost periodic extension of $X_\alpha$, and $X_\beta = \lim_{\alpha < \beta} X_\alpha$ for all ordinals $\alpha$ and limit ordinals $\beta$ less than or equal to $\nu$.

O. Introduction. It has been fourteen years since Furstenberg proved his beautiful structure theorem for metrizable minimal distal flows [4]. Since then there have been many attempts to do without the assumption that the phase space of the flow be metrizable. These have only been partially successful; some sort of countability assumption has always seemed necessary. The purpose of this paper is to provide a proof of the Furstenberg structure theorem which avoids the use of any countability assumptions.

There are other structure theorems in the literature ([2], [3], [5]), and they too make some sort of countability assumption. Since all of these theorems are closely related it is to be hoped that the methods developed here can be applied to these others as well. Indeed the first step in the proof of the Veech structure is given in this paper (see 1.11).

The basic idea is embodied in 1.6 which states that given a topologically transitive or minimal flow $(X, T)$, $H$ a countable subgroup of $T$, and $\rho$ a continuous pseudo-metric on $X$, there exists a countable subgroup $K \supset H$ with $(X_K, K)$ topologically transitive or minimal respectively. Since $K$ is countable, $X_K$ is metrizable and category arguments may be used to obtain results about $(X_K, K)$ which in turn are carried over to $(X, T)$ by inverse limit arguments.

In the original version of this paper the basic idea was used in an entirely different way to obtain the Furstenberg theorem. I would like to thank the W. A. Veech for suggesting the present version, it is shorter and more transparent than the original.

Standing Notation 1.1. Throughout this paper $(X, T)$ will denote a flow with compact Hausdorff phase space $X$ and phase group $T$. If $\rho$ is a pseudo-metric on $X$ and $H$ is a subgroup of $T$, then $R(H, \rho)$ or simply $R(H)$ will denote the subset, $\{(x, y) | \rho(\tau x, \tau y) = 0 (\tau \in H)\}$ of $X \times X$. The quotient space $X/R(H)$ will be denoted by $X_H$ and $\pi_H : X \to X_H$, $\pi^K_H : X_K \to X_H$ will denote the canonical maps. (Here $K$ is
LEMMA 1.2. Let \( \rho \) be a continuous pseudo-metric on \( X \) and \( H \) a subgroup of \( T \). Then 
1. \( R(H) \) is a closed \( H \)-invariant equivalence relation on \( X \).
2. \( H \) acts on \( X_H \).
3. If \( H \) is countable, \( X_H \) is metrizable.

Proof. Statements 1 and 2 follow immediately from the definition of \( R(H) \). With regards to 3 it is directly verifiable that 
\[
\sigma(a, b) = \sum_{i=1}^{\infty} 2^{-i} \rho(x_{t_i}, y_{t_i})(a, b \in X_H)
\]
is a metric on \( X_H \) compatible with the quotient topology. Here \( H = \{ t_i | i = 1, \cdots \} \), \( x, y \in X \) with \( \tau_H(x) = a \) and \( \tau_H(g) = b \).

DEFINITION 1.3. The flow \( (X, T) \) is topologically transitive if every nonnull invariant open set is dense.

REMARK 1.4. When \( X \) is metrizable, then \( (X, T) \) is topologically transitive if and only if the set of points with dense orbit is residual. (To see this consider \( \bigcap \{ UT | U \in \mathcal{U} \} \) where \( \mathcal{U} \) is a countable base for the topology on \( X \).)

LEMMA 1.5. Let \( \mathcal{S} \) be a collection of subgroups of \( T \) directed by inclusion (i.e., for every pair \( H, K \) of element of \( \mathcal{S} \) there exists \( L \in \mathcal{S} \) with \( H \cup K \subseteq L \)) and let \( \rho \) be a continuous pseudo-metric on \( X \). Then 
1. \( X_S = \lim_{\rightarrow} (X_H, \pi^S_H) \) where \( S = \bigcup \mathcal{S} \). 
2. If the flows \( (X_H, H) \) are minimal \( (H \in \mathcal{S}) \) then so is \( (X_S, S) \).

Proof. 1. Since \( \pi^S_K = \pi^H_K \circ \pi^K_H(\pi^H_K, K \in \mathcal{S} \text{ with } K \subseteq H) \), \( a = b \) if and only if \( \pi^S_K(a) = \pi^S_K(b) \) \( (K \in \mathcal{S}) \), \( (a, b \in X_S) \).

2. Let \( \cup \) be a nonvacuous open subset of \( X_S \). Then there exist \( H \in \mathcal{S} \) and a nonvacuous open subset \( V \) of \( X_H \) with \( \pi^{-1}_H(V) \subseteq \cup \). Since \( (X_H, H) \) is minimal, \( VH = X_H \). Hence \( \cup \supset (\pi_H^{-1}(V) \cup \supset (\pi_H^{-1}(V)H = (\pi_H^{-1}(V)H = X_S \).

PROPOSITION 1.6. Let \( (X, T) \) be topologically transitive (respectively minimal), \( \rho \) a continuous pseudo-metric on \( X \), and \( H \) a countable subgroup of \( T \). Then there exists a countable subgroup \( K \) of \( T \) such that \( H \subseteq K \) and \( (X_K, K) \) is topologically transitive (respectively minimal).

Proof. Assume \( (X, T) \) is topologically transitive. Set \( H_0 = H \) and \( \mathcal{U}_0 \) a countable basis for the topology on \( X_0 = X/R(H_0) \). Then \( V_0 = \bigcap \{ \pi_0^{-1}(\cup)T | \cup \in \mathcal{U}_0 \} \) is a residual subset of \( X \). (Here \( \pi_0 : X \to X_0 \) is the canonical map.)
Let $x_0 \in V_0$. Then $\pi_0(x_0 T) \cap \cup \neq \emptyset (\cup \in \mathcal{U}_0)$. Hence there exists a countable subgroup $H_1$ with $H_0 \subset H_1$ and $\pi_0(x_0 H_1)$ dense in $X_0$. Iterate the above procedure to obtain a sequence of points $(x_n)$ of $X$ and an increasing sequence of countable subgroups $(H_n)$ of $T$ such that $\pi_n(x_n H_{n+1})$ is dense in $X_n = X/R(H_n)$ (all $n$).

Set $K = \bigcup H_n$ and let $V_1$ and $V_2$ be two nonvacuous open subsets of $X_0$. Since $X_K = \lim X_n$, there exist $n$ and two nonvacuous open subsets $U_1$ and $U_2$ of $X_n$ such that $\varphi^{-1}(U_i) \subset V_i (i = 1, 2)$ where $\varphi: X/R(K) \to X_n$ is the canonical map. By construction there exist $h_1, h_2 \in H_{n+1} \subset K$ with $\pi_n(x_n h_i) \in U_i (i = 1, 2)$. Since $\pi_n = \varphi \circ \pi_K$, $\pi_K(x_n h_i) = \pi_n(x_n h_i) \in \varphi^{-1}(U_i) \subset V_i (i = 1, 2)$. Thus $V_i K \cap V_2 \neq \emptyset$ and so $(X_K, K)$ is topologically transitive as desired.

In the minimal case $\pi_0^{-1}(U)T = X(U \in \mathcal{U}_0)$ and thus since $X$ is compact and $\mathcal{U}_0$ countable, there exists a countable subgroup $H_1$ of $T$ with $H_0 \subset H_1$ and $\pi_0^{-1}(U)H_1 = X(U \in \mathcal{U}_0)$. (This implies that $\pi_0^{-1}(U)H_1 = X$ for all nonvacuous open subsets of $X_0$.)

Iteration now produces on increasing sequence $(H_n)$ of countable subgroups of $T$ such that $\pi_n^{-1}(U)H_{n+1} = X (\emptyset \neq U$ open in $X_n$, all $n$). Set $K = \bigcup H_n$ and let $\emptyset \neq V$ be open in $X_K$. Then there exist $n$ and a nonvacuous open subset $U$ of $X_n$ with $\varphi^{-1}(U) \subset V$. (\varphi: X_K \to X_n, canonical.) Then $X = \pi_n^{-1}(U)H_{n+1} = (\pi_K^{-1}(U))H_{n+1} \subset \pi_K^{-1}(V)K = \pi_K^{-1}(VK)$ whence $VK = \pi_K(X) = X_K$.

The proof is completed.

**Remark 1.7.** Let $(X, T)$ be minimal, $(X \times X, T)$ topologically transitive, $\rho$ a continuous pseudo-metric on $X$, and $H$ a countable subgroup of $T$. Then it is clear from the above that one can find a countable subgroup $K$ containing $H$ with $(X_K, K)$ minimal and $(X_K \times X_K, K)$ topologically transitive.

**Definition 1.8.** Let $x, y \in X$. Then $x$ and $y$ are **distal from one another** if there exists a continuous pseudo-metric $\rho$ on $X$ and $\varepsilon > 0$ such that $\rho(xt, yt) > \varepsilon (t \in T)$. The point $x$ is a **distal point** if $x$ and $y$ are distal ($y \in X, y \neq x$). The flow $(X, T)$ is **point distal** if it has a distal point and **distal** if every point is a distal point.

**Proposition 1.9.** Let $(X, T)$ be distal and topologically transitive. Then $(X, T)$ is minimal.

**Proof.** Let $\rho$ be a continuous pseudo-metric on $X$ and $\mathcal{S}$ the collection of countable subgroups $H$ of $T$ such that $(X_H, H)$ is topologically transitive. Then by 1.7 $\mathcal{S}$ is directed by inclusion and $\cup \mathcal{S} = T$. 
Let $H \in \mathcal{S}$. Then the canonical map $\pi_H$ is a homomorphism of the flow $(X, H)$ onto the flow $(X_H, H)$, whence the latter is distal. Since $(X_H, H)$ is metrizable and topologically transitive, it has a point with dense orbit whence it is minimal. Consequently $(X/R(T, \rho), T)$ is minimal by 1.5.

Now let $\mathcal{P}$ be the collection of continuous pseudo-metrics on $X$ directed by $\leq$. Then $(X, T) = \lim_{\mathcal{P}} (X/R(T, \rho), T)$ from which it follows that $(X, T)$ is minimal.

We are now in a position to prove the Furstenberg structure theorem without any countability assumptions. To this end it is evident from [4] or [1] that it suffices to prove the following:

**Proposition 1.10.** Let $(X, T)$ be minimal distal and let $\varphi : (X, T) \to (Y, T)$ be an epimorphism which is not one-one. Then there exists a homomorphic image $(Z, T)$ of $(X, T)$ which in turn is a nontrivial almost periodic extension of $(Y, T)$.

**Proof.** Assume no such flow $(Z, T)$ exists. This implies that the relation $R(\varphi)$ induced by $\varphi$ coincides with the relativized equicontinuous structure relation $S(\varphi)$.

Now $R(\varphi) = \{(x_i, x_{i+1})| \varphi x_i = \varphi x_{i+1}\} \subset X \times X$ is a closed invariant subset of $X \times X$, and so we have a flow $(R(\varphi), T)$. Since $(X, T)$ is distal so is $(R(\varphi), T)$. Consequently every point of $R(\varphi)$ is an almost periodic point of $(R(\varphi), T)$. This and the fact that that $R(\varphi) = S(\varphi)$ allow us to conclude that $(R(\varphi), T)$ is topologically transitive [6, Th. 2.6.3]. This implies that $(R(\varphi), T)$ is minimal (1.9) whence $R(\varphi) = \Delta$ the diagonal of $X \times X$, a contradiction. ($\varphi$ was assumed not to be one-one.) The proof is completed.

The final result is the first step in the proof of the Veech structure theorem [2] without any countability assumptions.

**Proposition 1.11.** Let $(X, T)$ be a nontrivial minimal point distal flow. Then it has a nontrivial equicontinuous factor.

**Proof.** Assume the conclusion false and let $x_0$ be a distal point of $X$. Then $X \times X$ is the equicontinuous structure relation and the set $\{(x_s, x_{s+t})| s, t \in T\}$ is dense in $X \times X$ and consists entirely of almost periodic points of the flow $(X \times X, T)$. Hence we may again apply [6, Th. 2.6.3] to conclude that $(X \times X, T)$ is topologically transitive.

Now let $H$ be a countable subgroup of $T$ and $\rho$ a continuous pseudo-metric on $X$. Then by 1.7 there exists a countable subgroup $K$ of $T$ such that $H \subset K$, $(X_K, K)$ is minimal, and $(X_K \times X_K, K)$ is topologically transitive.
The flow \((X_K, K)\) is metrizable and point distal. \((\pi_K(x_0))\) is a distal point.) If it were not trivial, it would have a nontrivial equicontinuous factor \((Y, K)\) by the metric version of the Veech structure theorem. Since \((X_K \times X_K, K)\) is topologically transitive, so is \((Y \times Y, K)\). This implies that \(Y\) must be a single point, whence \((X_K, K)\) is trivial. This implies that \(X_H\) is a single point and so \((X, T)\) is trivial (since \(H\) and \(\rho\) were arbitrary); a contradiction.

Mathematical papers intended for publication in the Pacific Journal of Mathematics should be in typed form or offset-reproduced, (not dittoed), double spaced with large margins. Please do not use built up fractions in the text of the manuscript. However, you may use them in the displayed equations. Underline Greek letters in red, German in green, and script in blue. The first paragraph or two must be capable of being used separately as a synopsis of the entire paper. Items of the bibliography should not be cited there unless absolutely necessary, in which case they must be identified by author and journal, rather than by item number. Manuscripts, in triplicate, may be sent to any one of the editors. Please classify according to the scheme of Math. Reviews, Index to Vol. 39. All other communications should be addressed to the managing editor, or Elaine Barth, University of California, Los Angeles, California, 90024.

50 reprints to each author are provided free for each article, only if page charges have been substantially paid. Additional copies may be obtained at cost in multiples of 50.

The Pacific Journal of Mathematics is issued monthly as of January 1966. Regular subscription rate: $72.00 a year (6 Vols., 12 issues). Special rate: $36.00 a year to individual members of supporting institutions.

Subscriptions, orders for numbers issued in the last three calendar years, and changes of address should be sent to Pacific Journal of Mathematics, 103 Highland Boulevard, Berkeley, California, 94708. Older back numbers obtainable from Kraus Periodicals Co., Route 100, Millwood, NY 10546.
