THE CLASS NUMBER OF $Q(\sqrt{-p})$ MODULO 4, FOR $p \equiv 3 \pmod{4}$ A PRIME

KENNETH S. WILLIAMS
THE CLASS NUMBER OF $\mathbb{Q}(\sqrt{-p})$ MODULO 4, FOR $p \equiv 3 \pmod{4}$ A PRIME

KENNETH S. WILLIAMS

If $p$ is a prime congruent to 3 modulo 4, it is well-known that the class number $h(-p)$ of the imaginary quadratic field $\mathbb{Q}(\sqrt{-p})$ is odd. In this paper we determine $h(-p)$ modulo 4.

The class number of $\mathbb{Q}(\sqrt{-p})$ is odd, if $p$ is a prime congruent to 3 modulo 4 (see for example [3: p. 413]. D.H. Lehmer [4: p. 9] has posed the problem of determining the Jacobi symbol $(-1/h(-p)) = (-1)^{(h(-p)-1)/2}$, that is, of determining $h(-p)$ modulo 4. In this paper we evaluate $h(-p)$ modulo 4 in terms of the class number $h(p)$ and the fundamental unit $\epsilon_p = T + UV\sqrt{-p}$ of the corresponding real quadratic field $\mathbb{Q}(\sqrt{p})$. It is known that $T$ and $U$ are positive integers which satisfy $T \equiv 0 \pmod{2}$, $U \equiv 1 \pmod{2}$, $N(\epsilon_p) = T^2 - pU^2 = +1$. We prove

**THEOREM.** If $p > 3$ is a prime congruent to 3 modulo 4 then

$$h(-p) \equiv h(p) + U + 1 \pmod{4}.$$  

It is easily checked that (1) does not hold for $p = 3$ ($h(-3) = h(3) = U = 1$). ($p = 3$ is a special case as this is the only value of $p \equiv 3 \pmod{4}$ for which the ring of integers of $\mathbb{Q}(\sqrt{-p})$ has more than 2 units.) The method of proof is purely analytic in nature, it uses Dirichlet's class number formula (in various forms) for both real and imaginary quadratic fields and also some results from cyclotomy. It would be of interest to give a purely algebraic proof.

**Proof.** Let $p > 3$ be a prime congruent to 3 modulo 4 and set $\rho = \exp(2\pi i/p)$. For $z$ a complex variable, we let

$$F_+(z) = \prod_{(j,p) = +1}^{p-1} (z - \rho^j), \quad F_-(z) = \prod_{(j,p) = -1}^{p-1} (z - \rho^j),$$

so that

$$F_+(z)F_-(z) = F(z),$$

where $F(z)$ is the cyclotomic polynomial of index $p$, that is,
\( F(z) = \prod_{j=1}^{p-1} (z - \rho^j) = \frac{z^p - 1}{z - 1} = z^{p-1} + z^{p-2} + \cdots + z + 1. \)

\( F_+ \) and \( F_- \) are polynomials in \( z \) of degree \((p - 1)/2\) with coefficients in the ring of integers of \( \mathbb{Q}(\sqrt{-p}) \) (see for example [6: p. 215]). Hence we can write

\[
(5) \quad F_+(z) = \frac{1}{2} \left( Y(z) - Z(z)\sqrt{-p} \right), \quad F_-(z) = \frac{1}{2} \left( Y(z) + Z(z)\sqrt{-p} \right),
\]

where \( Y \) and \( Z \) are polynomials with rational integral coefficients. From (3) and (5) we have

\[
(6) \quad Y(z)^2 + pZ(z)^2 = 4F(z).
\]

It is also known [6: p. 216] or [7: p. 209] that \( Y \) and \( Z \) have the symmetry properties expressed by

\[
(7) \quad Y(z) = \sum_{n=0}^{(p-3)/4} a_n(z^{(p-1)/2-n} - z^n), \quad Z(z) = \sum_{n=0}^{(p-3)/4} b_n(z^{(p-1)/2-n} + z^n),
\]

where the \( a_n \) and \( b_n \) are integers with

\[
a_0 = 2, a_1 = 1, a_2 = (3 - p)/4, \ldots
\]

and

\[
b_0 = 0, b_1 = 1, b_2 = \frac{1}{2} \left(1 + \left(\frac{2}{p}\right)\right), \ldots
\]

(see [7] for further values of \( a_n \) and \( b_n \); see [6] for a table of values of \( Y \) and \( Z \) for \( p \leq 29 \)).

Differentiating the expressions in (7) and (6) with respect to \( z \), we obtain respectively

\[
(8) \quad Y'(z) = \sum_{n=0}^{(p-3)/4} a_n \left(\frac{p-1}{2} - n\right)z^{(p-3)/2-n} - nz^{n-1},
\]

\[
Z'(z) = \sum_{n=0}^{(p-3)/4} b_n \left(\frac{p-1}{2} - n\right)z^{(p-3)/2-n} + nz^{n-1},
\]

and

\[
(9) \quad Y(z)Y'(z) + pZ(z)Z'(z) = 2F'(z).
\]

Taking \( z = i \) in (7) and (8) we obtain

\[
Y(i) = \begin{cases} 
A_3(1 - i), & \text{if } p \equiv 3 \pmod{8}, \\
A_7(1 + i), & \text{if } p \equiv 7 \pmod{8}, 
\end{cases}
\]

\[
Z(i) = \begin{cases} 
-B_3(1 + i), & \text{if } p \equiv 3 \pmod{8}, \\
B_7(1 - i), & \text{if } p \equiv 7 \pmod{8}, 
\end{cases}
\]
and

\[ Y'(i) = \begin{cases} C_3 + 2D_3 i, & \text{if } p \equiv 3 \pmod{8}, \\ C_7 + 2D_7 i, & \text{if } p \equiv 7 \pmod{8}, \end{cases} \]

(11)

\[ Z'(i) = \begin{cases} E_3 + 2F_3 i, & \text{if } p \equiv 3 \pmod{8}, \\ E_7 + 2F_7 i, & \text{if } p \equiv 7 \pmod{8}, \end{cases} \]

where \( A_3, \ldots, F_7 \) are rational integers (given in terms of the \( a_n \) and \( b_n \)). Using (10) and (11) in (6) and (9) with \( z = i \), we obtain

\[ \begin{cases} A_3^2 - pB_3^2 = -2, & \text{if } p \equiv 3 \pmod{8}, \\ A_7^2 - pB_7^2 = +2, & \text{if } p \equiv 7 \pmod{8}, \end{cases} \]

(12)

and

\[ \begin{cases} A_3C_3 + 2pB_3F_3 = -1, & 2A_3D_3 - pB_3E_3 = p, \text{ if } p \equiv 3 \pmod{8}, \\ A_7C_7 + 2pB_7F_7 = p, & 2A_7D_7 - pB_7E_7 = 1, \text{ if } p \equiv 7 \pmod{8}. \end{cases} \]

(13)

Clearly from (12) and (13) we see that \( A_3, C_3, E_3, A_7, C_7, E_7 \) are all odd. Now Liouville [5: p. 415] has shown that

\[ Z(z)Y'(z) - Z'(z)Y(z) = \frac{2}{z - 1} \sum_{j=1}^{p-1} \left( \frac{j}{p} \right) z^{p-1-j}. \]

(14)

Taking \( z = i \) in (14) we obtain

\[ Z(i)Y'(i) - Z'(i)Y(i) = (L + M) + i(L - M), \]

where

\[ L = \sum_{j=0}^{(p-1)/2} (-1)^j \left( \frac{2j}{p} \right), \quad M = \sum_{j=0}^{(p-1)/2} (-1)^j \left( \frac{2j + 1}{p} \right). \]

(15)

Applying the transformation \( j \to (p - 1)/2 - j \) to \( L \) or \( M \) we obtain \( L = M \). Also we have

\[ L = \sum_{j=1}^{(p-3)/4} \left( \frac{4j}{p} \right) - \sum_{j=0}^{(p-1)/4} \left( \frac{4j + 2}{p} \right) \]

\[ \quad = \sum_{j=1}^{(p-3)/4} \left( \frac{j}{p} \right) - \sum_{j=(p-1)/4}^{(p-1)/2} \left( \frac{4((p - 1)/2 - j) + 2}{p} \right) \]

\[ \quad = \sum_{j=1}^{(p-3)/4} \left( \frac{j}{p} \right) + \sum_{j=(p-1)/4}^{(p-1)/2} \left( \frac{j}{p} \right) = \sum_{j=1}^{(p-1)/2} \left( \frac{j}{p} \right), \]

so, by Dirichlet’s class number formula (as \( p \equiv 3 \pmod{4}, p < 3 \)) see for example [2: p. 346], we have

\[ L = M = \left\{ 2 - \left( \frac{2}{p} \right) \right\} h(-p). \]

(16)
Hence from (15) and (16) we have

\[ (17) \quad Z(i) Y'(i) - Z'(i) Y(i) = 2 \left[ 2 - \left( \frac{2}{p} \right) \right] h(-p). \]

Using (10) and (11) in (17), after equating real and imaginary parts, we obtain

\[ (18) \begin{cases} 
3h(-p) = 2B_3D_3 - A_3E_3, & \text{if } p \equiv 3 (\text{mod } 8), \\
2h(-p) = 2B_7D_7 - A_7E_7, & \text{if } p \equiv 7 (\text{mod } 8). 
\end{cases} \]

Now from (13) we have

\[ (19) \begin{cases} 
E_3 = -2A_3B_3D_3 - B_3 (\text{mod } 8), & \text{if } p \equiv 3 (\text{mod } 8), \\
E_7 = -2A_7B_7D_7 + B_7 (\text{mod } 8), & \text{if } p \equiv 7 (\text{mod } 8). 
\end{cases} \]

Using (19) in (18) we have

\[ (20) \begin{cases} 
h(-p) = \left( -\frac{2A_3}{n} \right) B_3 (\text{mod } 4), & \text{if } p \equiv 3 (\text{mod } 8), \\
h(-p) = \left( -\frac{2A_7}{n} \right) B_7 (\text{mod } 4), & \text{if } p \equiv 7 (\text{mod } 8). 
\end{cases} \]

From (4) we have \( F(i) = i \), and so taking \( z = i \) in (2) and (3) we obtain

\[-i(F_-(i))^2 = \frac{F_-(i)}{F_+(i)} = \prod_{j=1}^{p-1} (1 + i\rho^j)^{-(j/p)} = \exp \left( -\sum_{j=1}^{p-1} \left( \frac{j}{p} \right) \log (1 + i\rho^j) \right) = \exp \left( \sum_{n=1}^{\infty} \frac{(-i)^n}{n} \sum_{j=1}^{p-1} \left( \frac{j}{p} \right) \rho^{nj} \right) = \exp \left( i\sqrt{p} \sum_{n=1}^{\infty} \frac{n}{p} \left( \frac{-i}{n} \right) \right) = \exp \left( \sqrt{p} \sum_{m=0}^{\infty} \frac{2m+1}{2m+1} \frac{(-1)^m}{2m+1} + i\sqrt{p} \frac{2}{p} \sum_{m=1}^{\infty} \frac{m}{p} \frac{(-1)^m}{m} \right) = \exp \left( h(p) \log(T + U\sqrt{p}) + \frac{\pi i}{2} \left( 1 - \frac{2}{p} \right) h(-p) \right) = (T + U\sqrt{p})^{h(p)} e^{-\left( \frac{2}{p} \right) h(-p)} = (-1)^{(p+1)/4} (T + U\sqrt{p})^{h(p)}, \]

where we have made use of the Gauss sum

\[ \sum_{j=1}^{p-1} \left( \frac{j}{p} \right) \rho^{nj} = \left( \frac{n}{p} \right) i\sqrt{p}, \]

and the two results
\[
\sum_{m=1}^{\infty} \binom{m}{p} \frac{(-1)^m}{m} = \frac{\pi}{\sqrt{p}} \left( \left( \frac{2}{p} \right) - 1 \right) h(-p)
\]
and
\[
\sum_{m=0}^{\infty} \binom{2m+1}{p} \frac{(-1)^m}{2m+1} = \frac{h(p)}{\sqrt{p}} \log(T + U\sqrt{-p}) ,
\]
which follow easily by standard arguments from Dirichlet's class number formula (see for example [2: p. 343]). Hence we have (using (10))
\[
(T + U\sqrt{-p})^{h(p)} = (-1)^{(p-3)/4} i F^2(i)^2
\]
\[
= (-1)^{(p-3)/4} i \left\{ \frac{1}{2} (Y(i) + Z(i) i\sqrt{-p}) \right\}^2
\]
\[
= \frac{1}{2} (A_3 + B_3\sqrt{-p}), \text{ if } p \equiv 3 \pmod{8} ,
\]
\[
= \frac{1}{2} (A_7 + B_7\sqrt{-p}), \text{ if } p \equiv 7 \pmod{8} .
\]
This is essentially a result of Arndt [1].

Expanding \((T + U\sqrt{-p})^{h(p)}\) by the binomial theorem and equating coefficients of \(\sqrt{-p}\), we have as \(h(p) \equiv 1 \pmod{2}\),
\[
U^{h(p)} p^{(p-1)/2} \binom{h(p)}{2} U^{h(p)-1} T^2 p^{(h(p)-3)/2} + \ldots
\]
\[
= \begin{cases} 
A_3 B_3, & \text{if } p \equiv 3 \pmod{8} , \\
A_7 B_7, & \text{if } p \equiv 7 \pmod{8} .
\end{cases}
\]
As \(T \equiv 0 \pmod{2}, U \equiv 1 \pmod{2}\), this gives
\[
U(-1)^{\binom{p-1}{2}} \equiv \begin{cases} 
A_3 B_3 \pmod{4}, & \text{if } p \equiv 3 \pmod{8} , \\
A_7 B_7 \pmod{4}, & \text{if } p \equiv 7 \pmod{8} ,
\end{cases}
\]
so that
\[
(21) \quad h(p) \equiv \begin{cases} 
A_3 B_3 - U + 1 \pmod{4}, & \text{if } p \equiv 3 \pmod{8} , \\
A_7 B_7 - U + 1 \pmod{4}, & \text{if } p \equiv 7 \pmod{8} .
\end{cases}
\]
Putting (20) and (21) together, we obtain (1) as required.

From (1) we have \((-1/h(-p)) = (-1)^{(h(-p)-1)/2} = (-1)^{(h(p)+U)/2} \). In particular whenever \(h(p) = 1\) (a common occurrence) we have
\((-1/h(-p)) = (-1)^{(U+1)/2} \).

In [8] the author has treated, in a similar way, Lehmer's question [4: p. 10] regarding \(h(-2p)\) modulo 8, when \(p\) is a prime congruent to 5 modulo 8.

Mathematical papers intended for publication in the Pacific Journal of Mathematics should be in typed form or offset-reproduced, (not dittoed), double spaced with large margins. Please do not use built up fractions in the text of the manuscript. However, you may use them in the displayed equations. Underline Greek letters in red, German in green, and script in blue. The first paragraph or two must be capable of being used separately as a synopsis of the entire paper. Please propose a heading for the odd numbered pages of less than 35 characters. Manuscripts, in triplicate, may be sent to any one of the editors. Please classify according to the scheme of Math. Reviews, Index to Vol. 39. Supply name and address of author to whom proofs should be sent. All other communications should be addressed to the managing editor, or Elaine Barth, University of California, Los Angeles, California, 90024.

50 reprints to each author are provided free for each article, only if page charges have been substantially paid. Additional copies may be obtained at cost in multiples of 50.

The Pacific Journal of Mathematics is issued monthly as of January 1966. Regular subscription rate: $84.00 a year (6 Vols., 12 issues). Special rate: $42.00 a year to individual members of supporting institutions.

Subscriptions, orders for numbers issued in the last three calendar years, and changes of address should be sent to Pacific Journal of Mathematics, P.O. Box 969, Carmel Valley, CA 93924, U.S.A. Older back numbers obtainable from Kraus Periodicals Co., Route 100, Millwood, NY 10546.
