AN ARITHMETIC POISSON FORMULA

BRUCE C. BERNDT

AN ARITHMETIC POISSON FORMULA

BRUCE C. BERNDT

Let $a(n)$ denote any arithmetic function. Since most arithmetic functions that are encountered are defined on only the nonnegative integers, we define $a(-n) = a(n)$ for each positive integer n . Our objective is to develop a Poisson type formula for $\sum_{n=-\infty}^{\infty} a(n)f(n)$, where f belongs to a suitable class of functions. We conclude the paper with several applications of our arithmetic Poisson formula.

In another paper [2], the author has used a new technique in contour integration to examine infinite series of the type $\sum_{n=0}^{\infty} a(n)f(n)$, where now f is a suitable rational function. The author's method has been generalized and improved by Krishnaiah and Sita Rama Chandra Rao [5].

Let $b(n)$ be an arithmetic function, and let S denote any subset of the natural numbers. Define, for each positive integer m ,

$$(1) \quad a(m, n; S) = \sum_{\substack{d \leq m \\ d|n \\ d \in S}} b(d) \quad \text{and} \quad a(n; S) = \sum_{\substack{d|n \\ d \in S}} b(d).$$

Clearly, if $m \geq n$, $a(m, n; S) = a(n; S)$. If S is the set of all positive integers, we write $a(n; S) = a(n)$. Alternatively, given an arithmetic function $a(n)$, we could define $b(n)$ by

$$b(n) = \sum_{d|n} \mu(d)a(n/d),$$

where μ denotes the Möbius function.

There exist several formulations of Poisson's summation formula

$$(2) \quad \sum_{n=-\infty}^{\infty} f(n) = \sum_{n=-\infty}^{\infty} \int_{-\infty}^{\infty} f(x)e^{2\pi i n x} dx$$

in the literature, where here and in the sequel all doubly infinite sums are interpreted symmetrically, i.e., as $\lim_{N \rightarrow \infty} \sum_{n=-N}^N$. We shall choose the setting (with slightly stronger hypotheses) from Bellman's book [1, p. 8]. Thus, let $f(x)$ be continuous on $(-\infty, \infty)$, suppose that $f \in L^1(-\infty, \infty)$, and assume that the left and right sides of (2) converge absolutely. Then (2) holds.

THEOREM. *Suppose that f satisfies the conditions of Poisson's formula (2) as specified above. Let $a(n)$ and $b(n)$ denote arithmetic functions as related above. Assume also that $\sum_{n=-\infty}^{\infty} a(n)f(n)$ is absolutely convergent. Then*

$$(3) \quad \sum_{\substack{n=-\infty \\ n \neq 0}}^{\infty} a(n; S)f(n) = \sum_{\substack{d=1 \\ d \in S}}^{\infty} \frac{b(d)}{d} \left\{ \sum_{r=-\infty}^{\infty} \int_{-\infty}^{\infty} f(x)e^{2\pi irx/d} dx - f(0)d \right\}.$$

Proof. For each natural number d and real number x , define

$$\mathcal{S}(d; x) = \sum_{j=0}^{d-1} e^{2\pi i jx/d}.$$

Thus, if n is an integer,

$$(4) \quad \mathcal{S}(d; n) = \begin{cases} d, & \text{if } d|n, \\ 0, & \text{otherwise.} \end{cases}$$

Define, for each natural number m ,

$$B_m(x; S) = \sum_{\substack{d=1 \\ d \in S}}^m \frac{b(d)}{d} \mathcal{S}(d; x).$$

Hence, by (1) and (4), if $n \neq 0$,

$$(5) \quad B_m(n; S) = a(m, n; S),$$

while if $n = 0$,

$$(6) \quad B_m(0; S) = \sum_{\substack{d=1 \\ d \in S}}^m b(d).$$

Now put $F(x) = B_m(x; S)f(x)$. From the hypotheses of our theorem, it is easily seen that the real and imaginary parts of $F(x)$ satisfy the conditions of the ordinary Poisson summation formula (2). Hence, using (5) and (6), we find that

$$\begin{aligned} & \sum_{\substack{n=-\infty \\ n \neq 0}}^{\infty} a(m, n; S)f(n) + \sum_{\substack{d=1 \\ d \in S}}^m b(d)f(0) \\ &= \sum_{n=-\infty}^{\infty} \int_{-\infty}^{\infty} f(x) \sum_{\substack{d=1 \\ d \in S}}^m \frac{b(d)}{d} \sum_{j=0}^{d-1} e^{2\pi i(n+j/d)x} dx. \end{aligned}$$

Setting $r = nd + j$, we find that

$$\sum_{\substack{n=-\infty \\ n \neq 0}}^{\infty} a(m, n; S)f(n) = \sum_{\substack{d=1 \\ d \in S}}^m \frac{b(d)}{d} \left\{ \sum_{r=-\infty}^{\infty} \int_{-\infty}^{\infty} f(x)e^{2\pi irx/d} dx - f(0)d \right\}.$$

Letting m tend to ∞ on both sides above, we deduce (3). Taking the limit under the summation sign on the left side is justified by a lemma of Krishnaiah and Sita Rama Chandra Rao [5] that requires the absolute convergence of $\sum_{n=-\infty}^{\infty} a(n)f(n)$.

In each of the examples below we tacitly assume that $a(n)$ and $b(n)$ satisfy the hypotheses of our theorem.

EXAMPLE 1. Let $f(x) = 1/(x^2 + a^2)$, where $a^2 \neq n^2$ if n is an integer. Now if r is any integer [4, p. 406],

$$\int_{-\infty}^{\infty} \frac{e^{2\pi i r x/d}}{x^2 + a^2} dx = \frac{\pi}{2} e^{-2\pi r a/d}.$$

After an elementary computation, the theorem yields

$$\sum_{n=1}^{\infty} \frac{a(n; S)}{n^2 + a^2} = \frac{1}{2a^2} \sum_{\substack{d=1 \\ d \in S}}^{\infty} b(d) \left\{ \frac{\pi a}{d} \coth \left(\frac{\pi a}{d} \right) - 1 \right\}.$$

For some specific examples of the above formula, see [2] and [5].

A formula for $\sum_{n=1}^{\infty} (-1)^n a(n; S)/(n^2 + a^2)$ may be obtained by setting $f(x) = \cos(\pi x)/(x^2 + a^2)$ in the theorem. See [5] for such a formula.

EXAMPLE 2. Let $f(x) = x^2/(x^4 + a^4)$, where $a^4 \neq -n^4$ if n is an integer. Then for any integer r [4, pp. 409, 42],

$$\begin{aligned} & \sum_{r=1}^{\infty} \int_0^{\infty} \frac{x^2 \cos(2\pi r x/d)}{x^4 + a^4} dx \\ &= \frac{\pi\sqrt{2}}{4a} \sum_{r=1}^{\infty} e^{-\sqrt{2}\pi r a/d} \{ \cos(\sqrt{2}\pi r a/d) - \sin(\sqrt{2}\pi r a/d) \} \\ &= \frac{\pi\sqrt{2}}{8a} \left\{ \frac{\sinh(\sqrt{2}\pi a/d)}{\cosh(\sqrt{2}\pi a/d) - \cos(\sqrt{2}\pi a/d)} \right. \\ & \quad \left. - 1 - \frac{\sin(\sqrt{2}\pi a/d)}{\cosh(\sqrt{2}\pi a/d) - \cos(\sqrt{2}\pi a/d)} \right\}. \end{aligned}$$

Hence, using also the integral evaluation for $r = 0$, we deduce that

$$\sum_{n=1}^{\infty} \frac{a(n; S)n^2}{n^4 + a^4} = \frac{\pi\sqrt{2}}{4a} \sum_{\substack{d=1 \\ d \in S}}^{\infty} \frac{b(d)}{d} \left\{ \frac{\sinh(\sqrt{2}\pi a/d) - \sin(\sqrt{2}\pi a/d)}{\cosh(\sqrt{2}\pi a/d) - \cos(\sqrt{2}\pi a/d)} \right\}.$$

In particular, if we let $a(n) = 1, n = 1$, and $a(n) = 0, n > 1$, then $b(n) = \mu(n)$, and so

$$\frac{1}{1 + a^4} = \frac{\pi\sqrt{2}}{4a} \sum_{d=1}^{\infty} \frac{\mu(d)}{d} \left\{ \frac{\sinh(\sqrt{2}\pi a/d) - \sin(\sqrt{2}\pi a/d)}{\cosh(\sqrt{2}\pi a/d) - \cos(\sqrt{2}\pi a/d)} \right\}.$$

EXAMPLE 3. Let $f(x) = \operatorname{sech}(\pi x)$. Then for each integer r [4, p. 503],

$$\int_{-\infty}^{\infty} \frac{\cos(2\pi r x/d)}{\cosh(\pi x)} dx = \operatorname{sech}(\pi r/d).$$

Hence,

$$\sum_{n=1}^{\infty} a(n; S) \operatorname{sech}(\pi n) = \frac{1}{2} \sum_{\substack{d=1 \\ d \in S}}^{\infty} \frac{b(d)}{d} \left\{ 2 \sum_{r=1}^{\infty} \operatorname{sech}(\pi r/d) + 1 - d \right\}.$$

As an example, let $b(n)$ be Ramanujan's trigonometric sum $c_n(m)$, the sum of the m th powers of the primitive n th roots of unity. Then $a(n) = n$ or 0 according as $n \mid m$ or $n \nmid m$. Then the above formula yields

$$\sum_{n \mid m} n \operatorname{sech}(\pi n) = \frac{1}{2} \sum_{d=1}^{\infty} \frac{c_d(m)}{d} \left\{ 2 \sum_{r=1}^{\infty} \operatorname{sech}(\pi r/d) - d \right\},$$

since $\sum_{d=1}^{\infty} c_d(m)/d = 0$.

EXAMPLE 4. Let $f(x) = x \operatorname{csch}(\pi x)$. Then if r is any integer [4, p. 511],

$$\int_0^{\infty} \frac{x \cos(2\pi r x/d)}{\sinh(\pi x)} dx = \frac{1}{4} \operatorname{sech}^2(\pi r/d).$$

Hence, our theorem gives

$$\sum_{n=1}^{\infty} a(n; S) n \operatorname{csch}(\pi n) = \sum_{\substack{d=1 \\ d \in S}}^{\infty} \frac{b(d)}{d} \left\{ \frac{1}{2} \sum_{r=1}^{\infty} \operatorname{sech}^2(\pi r/d) + \frac{1}{4} - \frac{d}{2\pi} \right\}.$$

In particular, if we let $a(n) = \sigma_{-1}(n) = \sum_{d \mid n} 1/d$, the above formula reduces to

$$\sum_{n=1}^{\infty} \sigma_1(n) \operatorname{csch}(\pi n) = \frac{\pi^2}{24} + \frac{1}{2} \sum_{d=1}^{\infty} \frac{1}{d^2} \left\{ \sum_{r=1}^{\infty} \operatorname{sech}^2(\pi r/d) - \frac{d}{\pi} \right\}.$$

EXAMPLE 5. Let $f(t) = (x/|t|)^{1/2} J_1(2\pi\sqrt{|t|x})$, $x > 0$, where J_k denotes the ordinary Bessel function of order k . From the definition of J_1 it is easily seen that $f(0) = \pi x$. Since $J_0'(u) = -J_1(u)$, we find that

$$\int_0^{\infty} (x/t)^{1/2} J_1(2\pi\sqrt{tx}) dt = \frac{1}{\pi} \int_0^{\infty} J_1(u) du = \frac{1}{\pi}.$$

Next, for each nonzero integer r , [4, p. 742],

$$\begin{aligned} \int_0^{\infty} (x/t)^{1/2} J_1(2\pi\sqrt{tx}) \cos(2\pi r t/d) dt \\ = \frac{1}{\pi} \int_0^{\infty} J_1(u) \cos\left(\frac{ru^2}{2\pi xd}\right) du = \frac{2}{\pi} \sin^2\left(\frac{\pi xd}{4r}\right). \end{aligned}$$

Put $a(n) = r(n)$, the number of representations of n as the sum of two squares. Then $r(n) = 4 \sum_{d \mid n} \chi(d)$, where χ denotes the primitive character of modulus 4. Thus, the theorem yields

$$\begin{aligned} & \sum_{n=1}^{\infty} r(n)(x/n)^{1/2} J_1(2\pi\sqrt{nx}) \\ &= 4 \sum_{d=1}^{\infty} \frac{\chi(d)}{d} \left\{ \frac{4}{\pi} \sum_{r=1}^{\infty} \sin^2 \left(\frac{\pi xd}{4r} \right) + \frac{1}{\pi} - \frac{\pi xd}{2} \right\}. \end{aligned}$$

Now Voronoï [6] has shown that

$$\sum'_{n \leq x} r(n) = \pi x - 1 + \sum_{n=1}^{\infty} r(n)(x/n)^{1/2} J_1(2\pi\sqrt{nx}),$$

where the dash ' on the summation sign on the left side indicates that if x is an integer, only $r(x)/2$ is counted. Combining the last two equalities and using the fact that

$$\sum_{d=1}^{\infty} \chi(d)/d = \pi/4,$$

we deduce that

$$\sum'_{n \leq x} r(n) = \pi x + 4 \sum_{d=1}^{\infty} \frac{\chi(d)}{d} \left\{ \frac{4}{\pi} \sum_{r=1}^{\infty} \sin^2 \left(\frac{\pi xd}{4r} \right) - \frac{\pi xd}{2} \right\}.$$

Unfortunately, this does not appear to be of any use in the "circle problem." For related material, see [3, §8] and the references contained therein.

For additional examples, see [2] and, especially, [5].

Mathematical papers intended for publication in the *Pacific Journal of Mathematics* should be in typed form or offset-reproduced, (not dittoed), double spaced with large margins. Please do not use built up fractions in the text of the manuscript. However, you may use them in the displayed equations. Underline Greek letters in red, German in green, and script in blue. The first paragraph or two must be capable of being used separately as a synopsis of the entire paper. Please propose a heading for the odd numbered pages of less than 35 characters. Manuscripts, in triplicate, may be sent to any one of the editors. Please classify according to the scheme of Math. Reviews, Index to Vol. 39. Supply name and address of author to whom proofs should be sent. All other communications should be addressed to the managing editor, or Elaine Barth, University of California, Los Angeles, California, 90024.

50 reprints to each author are provided free for each article, only if page charges have been substantially paid. Additional copies may be obtained at cost in multiples of 50.

The *Pacific Journal of Mathematics* is issued monthly as of January 1966, Regular subscription rate: \$114.00 a year (6 Vol., 12 issues). Special rate: \$57.00 a year to individual members of supporting institution.

Subscriptions, orders for numbers issued in the last three calendar years, and changes of address should be sent to Pacific Journal of Mathematics, P.O. Box 969, Carmel Valley, CA 93924, U.S.A. Old back numbers obtainable from Kraus Periodicals Co., Route 100, Millwood, NY 10546.
