**ON THE ORDER OF  $\zeta(\frac{1}{2} + it)$  AND  $\Delta(R)$**

GRIGORI ABRAMOVICH KOLESNIK

# ON THE ORDER OF $\zeta(1/2 + it)$ AND $\mathcal{A}(R)$

G. KOLESNIK

In this paper we obtain new estimates of  $\zeta(1/2 + it)$ , the value of the Riemann zeta-function on the critical line, and  $\mathcal{A}(R)$ , the remainder in the Dirichlet divisor problem.

The estimates are

$$\zeta\left(\frac{1}{2} + it\right) \ll t^{35/216+\varepsilon} \quad \text{for any } \varepsilon > 0$$

and

$$\mathcal{A}(R) \ll R^{35/108+\varepsilon} \quad \text{for any } \varepsilon > 0,$$

which improve previously known best results.

Our results are obtained by van der Corput's method to the estimation of trigonometric sums of several variables. The method can be applied to other problems which involve such trigonometric sums. The article consists of three sections. Section 1 contains lemmas, in § 2 we prove the theorem, in § 3 we obtain the consequences of the theorem—the new estimates of  $\zeta(1/2 + it)$  and  $\mathcal{A}(R)$ .

The author expresses his gratitude to Professor E. G. Straus for improving the original manuscript.

## 1. Notations.

$\mathcal{A}(R)$ —the remainder in the Dirichlet divisor problem.

$C$  is any absolute constant,  $\varepsilon$  is any sufficiently small positive constant.

$\mathcal{A}_l(f) = \mathcal{A}_l(f(x_1, \dots, x_n))$  is the principal minor of order  $l$  of the Hessian of  $f(x_1, \dots, x_n)$ .

$R(f_1(\theta), f_2(\theta))$ —the resultant of two polynomials  $f_1(\theta)$  and  $f_2(\theta)$ .

$\sigma_{jn} = \sigma_{jn}(\alpha_1, \dots, \alpha_n)$ —the  $j$ th elementary symmetric function of  $\alpha_1, \dots, \alpha_n$ .

$f(x) \ll g(x)$  (or  $f(x) \gg g(x)$ ) means that  $|f(x)| \leq cg(x)$  (or  $f(x) \geq cg(x)$ ) for some  $c$ .

$$e(f(x)) = \exp(2\pi i f(x)).$$

For a domain  $\mathcal{D} \in R^2$  and real numbers  $A_1, A_2, A_3, A_4$ ,

$$\mathcal{D}(A_1, A_2, A_3, A_4) = \mathcal{D} \cap \{(x_1, x_2) | A_1 \leq x_1 \leq A_2; A_3 \leq x_2 \leq A_4\}.$$

If  $f(x_1, x_2)$  is a continuously differentiable function, then

$$\mathcal{D}(f) = \{(y_1, y_2) | y_1 = f_{x_1}(x_1, x_2), y_2 = f_{x_2}(x_1, x_2), (x_1, x_2) \in \mathcal{D}\}.$$

All functions are assumed to be sufficiently many times differentiable.

All domains  $\mathcal{D}, \mathcal{D}_1, \dots$  considered will be domains bounded by  $O(1)$  algebraic curves of order  $O(1)$  so that every straight line intersects  $\mathcal{D}$  in  $O(1)$  line segments.

Wherever a variable occurs as a summation variable the reference is to integer values of the variable.

**LEMMA 1.** *Let  $f(x)$  be a real function such that*

$$|f^{(l)}(x)| \leq F_l^{-1} > 0 \quad \text{on } [X, X_1], \quad l \geq 1.$$

*Then*

$$\int_X^{X_1} e(f(x)) dx \ll (F_l)^{1/l}.$$

This lemma can be proved by induction similarly to Lemma 4.5, p. 62, [2].

**LEMMA 2.** *Let  $1 < X \leq X_1 \leq 2X$  and  $K \geq 3$ . Let  $f(x)$  be a real-valued function, analytic in  $\mathcal{D} = \{z \mid |z - x| \leq \sqrt{cF_2 \log x}, X \leq x \leq X_1\}$  where  $c$  is some sufficiently large constant and  $F_2^{-1} \leq f''(x) \ll F_2^{-1}$  for  $x \in [X, X_1]$ . Let  $|f^{(l)}(z)| \ll F_l^{-1}$  ( $l = 2, \dots, K$ ) for  $z \in \mathcal{D}$ , and let  $x_n$  be the solution of the equation  $f'(x_n) = n$ . Then*

$$\begin{aligned} S &= \sum_{X \leq x \leq X_1} e(f(x)) \\ &= \sum_{f'(X) \leq n \leq f'(X_1)} (f''(x_n))^{-1/2} e\left(\frac{1}{8} + f(x_n) - nx_n\right) + O(\sqrt{F_2 \log^3 X}) \end{aligned}$$

*and*

$$S \ll \frac{X}{\sqrt{F_2}} + \min_{2 \leq l \leq K} (F_l)^{1/l}.$$

The proof is similar to the proof of the Theorem 4.9, p. 65, [2] with the use of Lemma 1 (see also Lemma 1 of [1]).

**LEMMA 3.** *Let  $a(x_1, x_2)$  be real twice continuously differentiable function and let  $b(x_1, x_2)$  be a function on  $\mathcal{D} \in R^2$  such that  $a_{x_1}, a_{x_2}, a_{x_1 x_2}$  do not change sign and  $|a(x_1, x_2)| \leq A$  in  $\mathcal{D}$ . Then for some  $A_1, A_2, B_1, B_2$  and  $\mathcal{D}_1 = \mathcal{D}(A_1, A_2, B_1, B_2)$  we have*

$$\left| \sum_{(x_1, x_2) \in \mathcal{D}} a(x_1, x_2) b(x_1, x_2) \right| \ll A \left| \sum_{(x_1, x_2) \in \mathcal{D}_1} b(x_1, x_2) \right|.$$

This lemma is a simple corollary of Lemma 1 in [3].

**LEMMA 4.** *Let  $\mathcal{D}$  be a domain, contained in the rectangle  $\{(x_1, x_2) \mid X_1 \leq x_1 \leq 2X_1, X_2 \leq x_2 \leq 2X_2\}$ , and let  $f(x_1, x_2)$  be three times continuously differentiable functions such that:*

(i) for all integers  $a_{i_l, j_l} \in [-c, c]$  the functions  $\sum_{i,j} \prod_{l=1}^6 a_{i_l, j_l} f_{x_1^{i_l} x_2^{j_l}}$  do not change sign in  $\mathcal{D}$ , where  $i = (i_1, \dots, i_c)$ ,  $j = (j_1, \dots, j_c)$ , and the sum is over all possible distinct  $(i, j)$  such that  $i_l + j_l \leq 4$  ( $l = 1, \dots, 6$ );

$$(ii) |f_{x_1^i x_2^j}| \leq cF/x_1^i x_2^j, 1/M_1 \leq f_{x_1^2} \leq c/M_1, 1/M_2 \leq f_{x_1^2} f_{x_2^2} - (f_{x_1 x_2})^2 \leq c/M_2;$$

(iii)  $f(x_1, x_2)$  satisfies the conditions of Lemma 2 as a function of  $x_1$  with  $M = M_1$ ;

(iv)  $g(y_1, x_2) = f(x_1(y_1, x_2), x_2) - y_1 x_1(y_1, x_2)$  satisfies the conditions of Lemma 1 as a function of  $x_2$  with  $M = M_2/M_1$ , where  $x_1(y_1, x_2)$  is the function satisfying  $f_{x_1}(x_1(y_1, x_2), x_2) = y_1$ . Let  $\varphi_1 = \varphi_1(y_1, y_2)$ ,  $\varphi_2 = \varphi_2(y_1, y_2)$  be the solution of the system

$$f_{x_1}(\varphi_1, \varphi_2) = y_1, \quad f_{x_2}(\varphi_1, \varphi_2) = y_2.$$

Then there exist some numbers  $A_1, A_2, A_3, A_4, B_1, B_2, B_3, B_4$  such that for  $\mathcal{D}_1 = \mathcal{D}'(A_1, A_2, A_3, A_4)$ ,  $\mathcal{D}' = \mathcal{D}''(f)$ ,  $\mathcal{D}'' = \mathcal{D}(B_1, B_2, B_3, B_4)$  we have

$$\begin{aligned} S &= \left| \sum_{(x_1, x_2) \in \mathcal{D}} e(f(x_1, x_2)) \right| \\ &\ll \sqrt{M_2} \left| \sum_{(y_1, y_2) \in \mathcal{D}_1} e(f(\varphi_1, \varphi_2) - y_1 \varphi_1 - y_2 \varphi_2) \right| \\ &\quad + X_2 \sqrt{M_1 \log^3 X_1} + \sqrt{M_2 \log^3 X_2} + \frac{F}{X_1} \sqrt{M_2 \log^3 X_2} \\ &\ll M_2^{-1/2} \sum_{(x_1, x_2) \in \mathcal{D}} 1 + X_2 \sqrt{M_1 \log^3 X_1} + \sqrt{M_2 \log^3 X_2} \\ &\quad + F \sqrt{M_2 \log^3 X_2} / X_1. \end{aligned}$$

Also, if

$$|f_{x_2^8}(f_{x_1^2})^3 - 3f_{x_2^2 x_1} f_{x_1 x_2} (f_{x_1^2})^2 + 3f_{x_1^2 x_2} (f_{x_1 x_2})^2 f_{x_1^2} + f_{x_1^8} (f_{x_1 x_2})^3| \geq M_3^{-1},$$

then

$$S \ll M_2^{-1/2} \sum_{(x_1, x_2) \in \mathcal{D}} 1 + X_2 \sqrt{M_1 \log^3 X_1} + (F/X_1 + 1) \cdot \sqrt{M_3/M_2^3}.$$

*Proof.* Taking the derivatives, we get

$$\frac{\partial x_1(y_1, x_2)}{\partial y_1} = \frac{1}{f_{x_1^2}}, \quad \frac{\partial x_1(y_1, x_2)}{\partial x_2} = -\frac{f_{x_1 x_2}}{f_{x_1^2}},$$

$$g_{x_2} = f_{x_2}, \quad g_{x_2^2} = [f_{x_1^2} f_{x_2^2} - (f_{x_1 x_2})^2] / f_{x_1^2},$$

$$g_{x_2^3} = [f_{x_2^3} (f_{x_1^2})^3 - 3f_{x_2^2 x_1} f_{x_1 x_2} (f_{x_1^2})^2 + 3f_{x_1^2 x_2} (f_{x_1 x_2})^2 f_{x_1^2} + f_{x_1^8} (f_{x_1 x_2})^3] / (f_{x_1^2})^3.$$

Now we apply successively Lemmas 2 and 3:

$$\begin{aligned} S &= \left| \sum_{x_2} \sum_{x_1} e(f(x_1, x_2)) \right| \\ &= \left| \sum_{x_2} \left( \sum_{y_1} (f_{x_1^2})^{-1/2} e(g(y_1, x_2)) + O(\sqrt{M_1 \log^3 X_1}) \right) \right| \\ &\ll \sqrt{M_1} \left| \sum_{(y_1, x_2) \in \mathcal{D}} e(g(y_1, x_2)) \right| + O(X_2 \sqrt{M_1 \log^3 X_1}) \end{aligned}$$

where

$$\begin{aligned}\mathcal{D}_2 &= \mathcal{D}_3(a_1, a_2, b_1, b_2), \\ \mathcal{D}_3 &= \{(y_1, x_2) | y_1 = f_{x_1}(x_1, x_2), (x_1, x_2) \in \mathcal{D}\},\end{aligned}$$

because  $(f_{x_1}^2)^{-1/2} = (f_{x_1}^2(x_1(y_1, x_2), x_2))^{-1/2}$  satisfies the conditions of Lemma 3 on function  $a(x_1, x_2)$  with  $A = CM_1^{1/2}$ .

Using (i) we can verify that the function

$$f_{x_2}^2(\varphi_1, \varphi_2) - (f_{x_1 x_2}(\varphi_1, \varphi_2))^2/f_{x_1}^2(\varphi_1, \varphi_2)$$

also satisfies the same conditions with  $A = C\sqrt{M_2/M_1}$ , and we can apply again Lemma 2 first, then Lemma 3 to get

$$\begin{aligned}S &\ll \sqrt{M_1} \cdot \left| \sum_{y_1} \left[ \sum_{y_2} (g_{x_2}(y_1, x_2(y_1, y_2))^{-1/2} e(g(y_1, x_2(y_1, y_2)) - y_2 x_2(y_1, y_2))) \right. \right. \\ &\quad \left. \left. + O\left(\sqrt{\frac{M_2}{M_1}} \log^3 X_2\right)\right] \right| + X_2 \sqrt{M_1 \log^3 X_1} \\ &\ll \sqrt{M_1} \cdot \sqrt{M_2/M_1} \cdot \left| \sum_{(y_1, y_2) \in \mathcal{D}_1} e(g(y_1, x_2(y_1, y_2)) - y_1 x_2(y_1, y_2)) \right| \\ &\quad + \sqrt{M_2 \log^3 X_2} \sum_{y_1} 1 + X_2 \sqrt{M_1 \log^3 X_1},\end{aligned}$$

where

$$\begin{aligned}\mathcal{D}_1 &= \mathcal{D}_4(c_1, c_2, d_1, d_2), \\ \mathcal{D}_4 &= \{(y_1, y_2) | y_2 = g_{x_2}(y_1, x_2), (y_1, x_2) \in \mathcal{D}_2\},\end{aligned}$$

$x_2(y_1, y_2)$  is the function satisfying  $g_{x_2}(y_1, x_2) = y_2$ . Here

$$g_{x_2} = f_{x_2}(x_1(y_1, x_2), x_2)$$

and  $x_2(y_1, y_2)$  satisfies the system

$$\begin{aligned}f_{x_1} &= y_1, \quad f_{x_2} = y_2, \quad \text{i.e.,} \\ x_2(y_1, y_2) &= \varphi_2(y_1, y_2);\end{aligned}$$

also,  $x_1(y_1, x_2(y_1, y_2))$  satisfies the same system, i.e.,  $x_1(y_1, y_2) = \varphi_1(y_1, y_2)$ ;

$$\sum_{y_1} 1 \leq 1 + (\max_{y_1} f_{x_1}(x_1, x_2) - \min_{y_1} f_{x_1}(x_1, x_2)) \ll 1 + \frac{F}{X_1}.$$

Putting this into the last inequality for  $S$ , we prove the lemma.

LEMMA 5. Let  $f(x_1, \dots, x_n)$  be a real function, and let  $D$  be some subdomain of the rectangular parallelepiped  $X_i \leq x_i \leq 2X_i$ ;  $f_1(x_1, \dots, x_n, h_1, \dots, h_n) = \int_0^1 (\partial/\partial t)(f(x_1 + h_1 t, \dots, x_n + h_n t) dt)$ ;  $q_1, \dots, q_n$  are positive numbers such that

$$\frac{q_1}{X_1} = \frac{q_2}{X_2} = \dots = \frac{q_n}{X_n} = \sqrt[n]{\frac{Q}{N}} \ll 1; \quad q_1 \cdots q_n = Q; \quad X_1 \cdots X_n = N;$$

$$D_1 = \{(x, h) | h \neq 0, |h_i| < q_i, x \in D, x + h \in D\},$$

$$h = (h_1, \dots, h_n); \quad x = (x_1, \dots, x_n); \quad S = \frac{1}{N} \sum_x e(f(x))$$

$$S_1 = \frac{1}{NQ} \sum_{(x, h) \in \mathcal{D}_1} e(f_1(x, h)).$$

Then

$$S \ll \frac{1}{\sqrt{Q}} + \sqrt{S_1 \cdot \frac{1}{N} \sum_x 1}.$$

The proof is similar to the proof of Lemma 5.10, p. 91, [2].

## 2. Theorem.

### 1. Notation for the theorem.

$$\varphi_{k,l}(\theta) = C_{k+3,l} \cdot \theta^3 + C_{k+2,l+1} \sigma_{13} \theta^2 + C_{k+1,l+2} \sigma_{23} \theta + C_{k,l+3} \sigma_{33}$$

$$\varphi_1(\theta) = \varphi_{20}(\theta) \cdot \varphi_{02}(\theta) - (\varphi_{11}(\theta))^2$$

$$\varphi_2(\theta) = \varphi_{30}(\theta) \cdot (\varphi_{02}(\theta))^3 - 3\varphi_{21}(\theta)\varphi_{11}(\theta) \cdot (\varphi_{02}(\theta))^2$$

$$+ 3\varphi_{12}(\theta) \cdot (\varphi_{11}(\theta))^2 \varphi_{02}(\theta) - \varphi_{03}(\theta) \cdot (\varphi_{11}(\theta))^3;$$

$$R_1(\sigma_1, \sigma_2, \sigma_3) = R\varphi_{20}(\theta), \quad \varphi_{02}(\theta);$$

$$\Delta \equiv \Delta(f(x, y)) = f_{x^2}(x, y) \cdot f_{y^2}(x, y) - (f_{xy}(x, y))^2;$$

$$\Phi_{2,0}(f(x, y)) = -f_{y^2}(x, y);$$

$$\Phi_{1,1}(f(x, y)) = f_{xy}(x, y);$$

$$\Phi_{0,2}(f(x, y)) = -f_{x^2}(x, y);$$

$$\begin{aligned} \Phi_{i,j+1}(f(x, y)) = & \left( -f_{xy}(x, y) \frac{\partial}{\partial x} \left( \frac{\Phi_{i,j}(f(x, y))}{\Delta^{2i+2j-3}} \right) \right. \\ & \left. + f_{x^2}(x, y) \frac{\partial}{\partial y} \left( \frac{\Phi_{i,j}(f(x, y))}{\Delta^{2i+2j-3}} \right) \right) \Delta^{2i+2j-1}; \end{aligned}$$

$$\begin{aligned} \Phi_{i+1,j}(f(x, y)) = & f_{y^2}(x, y) \frac{\partial}{\partial x} \left( \frac{\Phi_{i,j}(f(x, y))}{\Delta^{2i+2j-3}} \right) \\ & - \frac{\partial}{\partial y} \left( \frac{\Phi_{i,j}(f(x, y))}{\Delta^{2i+2j-3}} \right) f_{xy}(x, y) \Delta^{2i+2j-1}; \end{aligned}$$

$\varphi_{i+3}(\theta)$  ( $i=0, 1, 2, 3$ ) are the polynomials of  $\theta$ , obtained respectively from  $\Phi_{3,2}(f(x, y))$ ,  $\Phi_{2,3}(f(x, y))$ ,  $\Phi_{1,4}(f(x, y))$  and  $\Phi_{0,5}(f(x, y))$  by the substitution of  $\varphi_{k,l}(\theta)$  for  $f_{x^k y^l}(x, y)$ ;  $\varphi_7(\theta) = \varphi_3(\theta) \varphi_5(\theta) - (\varphi_4(\theta))^2$ ;  $\varphi_8(\theta) = \varphi_4(\theta) \cdot \varphi_6(\theta) - (\varphi_5(\theta))^2$ .

$$\psi_{k,l}(\theta) = C_{k+3,l} \theta^3 + C_{k+2,l+1} \sigma_{12} \theta^2 + C_{k+1,l+2} \sigma_{22}$$

$$\psi_1(\theta) = \psi_{2,0}(\theta) \psi_{0,2}(\theta) - (\psi_{1,1}(\theta))^2.$$

$\psi_2(\theta)$  is the polynomial obtained from  $\Phi_{0,4}(f(x, y))$  by substitution of  $\psi_{k,l}(\theta)$  for  $f_{x^k y^l}(x, y)$ .

2. THEOREM. Let  $f(x, y)$  be a real function;  $|f(x, y)| \leq F$ ;  $f_{x^k y^l}(x, y) = C_{k,l}(f(x, y))/x^k y^l + O(\delta F/X^k Y^l)$ ,  $(x, y) \in D$ ;  $\delta \ll N^{-1/3}$ ;  $D$  is the domain of Lemma 4;  $X \geq Y$ ;  $C_{k,l}$  are numbers such that each of the following systems of equations as functions of  $\sigma_{13}(\alpha_1, \alpha_2, \alpha_3)$ ,  $\sigma_{23}(\alpha_1, \alpha_2, \alpha_3)$ ,  $\sigma_{33}(\alpha_1, \alpha_2, \alpha_3)$  doesn't have any solution:

$$(1) \quad \varphi_{20}(1) = \varphi_{02}(1) = \frac{\partial \varphi_{20}(1)}{\partial \theta} = \frac{\partial \varphi_{02}(1)}{\partial \theta} = 0$$

$$(2) \quad \varphi_{20}(1) = \varphi_{02}(1) = \varphi_{11}(1) = \frac{\partial \varphi_{20}(1)}{\partial \theta} = 0$$

$$(3) \quad \varphi_{20}(1) = \varphi_{02}(1) = \varphi_{11}(1) = \frac{\partial \varphi_{02}(1)}{\partial \theta} = 0$$

$$(4) \quad \varphi_{20}(1) = \frac{\partial \varphi_{20}(1)}{\partial \theta} = \frac{\partial^2 \varphi_{20}(1)}{\partial \theta^2} = \varphi_{11}(1) = 0$$

$$(5) \quad \varphi_{02}(1) = \frac{\partial \varphi_{02}(1)}{\partial \theta} = \frac{\partial^2 \varphi_{02}(1)}{\partial \theta^2} = \varphi_{11}(1) = 0$$

$$(6) \quad \varphi_{20}(1) = \varphi_{02}(1) = \varphi_{11}(1) = \frac{\partial_{20} \varphi(1)}{\partial \theta} \cdot \frac{\partial \varphi_{02}(1)}{\partial \theta} - \left( \frac{\partial \varphi_{11}(1)}{\partial \theta} \right)^2 = 0$$

$$(7) \quad \varphi_{20}(1) = \varphi_{11}(1) = \frac{\partial \varphi_{20}(1)}{\partial \theta} = \varphi_{02}(1) \cdot \frac{\partial^2 \varphi_{20}(1)}{\partial \theta^2} - 2 \left( \frac{\partial \varphi_{11}(1)}{\partial \theta} \right)^2 = 0$$

$$(8) \quad \varphi_{02}(1) = \varphi_{11}(1) = \frac{\partial \varphi_{02}(1)}{\partial \theta} = \varphi_{20}(1) \cdot \frac{\partial^2 \varphi_{02}(1)}{\partial \theta^2} - 2 \left( \frac{\partial \varphi_{11}(1)}{\partial \theta} \right)^2 = 0$$

$$(9) \quad \varphi_1(1) = \varphi_2(1) = \frac{\partial \varphi_1(1)}{\partial \theta} = \frac{\partial^2 \varphi_1(1)}{\partial \theta^2} = 0$$

$$(10) \quad \varphi_{20}(1) = \varphi_{02}(1) = \frac{\partial \varphi_{20}(1)}{\partial \theta} = \frac{\partial^2 \varphi_{20}(1)}{\partial \theta^2} = 0$$

$$(11) \quad \varphi_{20}(1) = \varphi_{02}(1) = \frac{\partial \varphi_{02}(1)}{\partial \theta} = \frac{\partial^2 \varphi_{02}(1)}{\partial \theta^2} = 0$$

$$(12) \quad \varphi_{20}(1) = \varphi_{02}(1) = \varphi_{11}(1) = \frac{\partial \varphi_{11}(1)}{\partial \theta} = 0$$

$$(13) \quad \begin{aligned} \frac{1}{\sigma_{33}} R_1(\sigma_{13}, \sigma_{23}, \sigma_{33}) &= \frac{\partial}{\partial \alpha_3} \left( \frac{1}{\sigma_{33}} R_1(\sigma_{13}, \sigma_{23}, \sigma_{33}) \right) \\ &= \frac{\partial^2}{\partial \alpha_3^2} \left( \frac{1}{\sigma_{33}} R_1(\sigma_{13}, \sigma_{23}, \sigma_{33}) \right) = 0 \end{aligned}$$

$$(14) \quad \varphi_{20}(1) = \varphi_{02}(1) = \frac{\partial \varphi_{20}(1)}{\partial \theta} = \frac{\partial}{\partial \alpha_3} R_1(\sigma_{13}, \sigma_{23}, \sigma_{33}) = 0$$

$$(15) \quad \varphi_{20}(1) = \varphi_{02}(1) = \frac{\partial \varphi_{02}(1)}{\partial \theta} = \frac{\partial}{\partial \alpha_3} R_1(\sigma_{13}, \sigma_{23}, \sigma_{33}) = 0$$

$$(16) \quad \frac{\partial^k \varphi_j(1)}{\partial \theta^k} = 0 \quad (k = 0, 1, \dots, 6; j = j_1, j_2, j_3), \quad \text{where } \{j_1, j_2, j_3\}$$

is any three element subset of  $\{3, 4, 5, 6\}$ .

$$(17) \quad \frac{\partial^k \varphi_7(1)}{\partial \theta^k} = \frac{\partial^j \varphi_8(1)}{\partial \theta^j} = 0 \quad (k, j = 1, \dots, 22)$$

$$(18) \quad \psi_{20}(1) = \psi_{02}(1) = \frac{\partial \psi_{20}(1)}{\partial \theta} = 0$$

$$(19) \quad \psi_{20}(1) = \psi_{02}(1) = \frac{\partial \psi_{02}(1)}{\partial \theta} = 0$$

$$(20) \quad \psi_{20}(1) = \frac{\partial \psi_{20}(1)}{\partial \theta} = \psi_{11}(1) = 0$$

$$(21) \quad \psi_{02}(1) = \frac{\partial \psi_{02}(1)}{\partial \theta} = \psi_{11}(1) = 0$$

$$(22) \quad \psi_{02}(1) = \psi_{11}(1) = \psi_{20}(1) = 0$$

$$(23) \quad \psi_1(1) = \frac{\partial \psi_1(1)}{\partial \theta} = \frac{\partial^2 \psi_1(1)}{\partial \theta^2} = \frac{\partial^3 \psi_1(1)}{\partial \theta^3} = 0$$

$$(24) \quad \psi_2(1) = \frac{\partial \psi_2(1)}{\partial \theta} = \dots = \frac{\partial^6 \psi_2(1)}{\partial \theta^6} = 0$$

$$(25) \quad R_1(3, 3, 1) \neq 0, \quad \frac{\partial^6}{\partial \alpha_1^4 \partial \alpha_2^2} \left( \frac{1}{\sigma_{33}} R_1(\sigma_{13}, \sigma_{23}, \sigma_{33}) \right) \neq 0$$

$$(26) \quad c_{05}c_{41} \neq c_{23}^2; \quad c_{50}c_{23} \neq c_{32}c_{41}; \quad c_{50}c_{14} \neq c_{32}^2; \quad c_{14}c_{41} \neq c_{23}c_{32}; \\ c_{05}c_{50} \neq c_{14}c_{41}; \quad c_{05}c_{50} \neq c_{23}c_{32}; \quad c_{32}c_{05} \neq c_{23}c_{14}.$$

Then

$$\sum_{x, y \in D} e(f(x, y)) \ll N^{1+\varepsilon} \sqrt{\frac{N^{61/38}}{F} + \frac{F}{N^{85/38}}}.$$

*Proof.* I. Let  $X \leq N^{41/76}$ . Applying Lemma 5 three times, we obtain:

$$S \ll \frac{1}{\sqrt{Q}} + \sqrt[8]{S_1}, \quad \text{where } S_1 = \frac{1}{NQ^7} \sum_h \sum_{(x, y) \in D_1} e(f_1(x, y, h)) \\ h = (h_1, \dots, h_6) \neq 0, \quad |h_i| < q_i;$$

$$D_1 = D_1(h)$$

$$= \{(x, y) | (x + h_1 t_1 + h_3 t_2 + h_5 t_3, y + h_2 t_1 + h_4 t_2 + h_6 t_3) \in D, 0 \leq t_i \leq 1\}$$

$$f_1(x, y, h) = \int_0^1 \int_0^1 \int_0^1 \frac{\partial^3}{\partial t_1 \partial t_2 \partial t_3} f(x + h_1 t_1 + h_3 t_2 + h_5 t_3, \\ y + h_2 t_1 + h_4 t_2 + h_6 t_3) dt_1 dt_2 dt_3;$$

$$q_1 q_2 = Q = \min \{F^{-1/4} N^{61/152}; F^{1/4} N^{-85/152}\}; \quad q_3 q_4 = Q^2; \quad q_5 q_6 = Q^4; \\ q_1/q_2 = q_3/q_4 = q_5/q_6 = X/Y; \quad XY = N; \quad \delta \ll \sqrt{Q^4/N}.$$

Denoting  $\theta = y/x$ , we obtain:

$$\frac{\partial^{k+l} f_1(x, y, h)}{\partial x^k \partial y^l} = \frac{f(x, y) h_1 h_3 h_5}{x^k y^{l+3}} \varphi_{k,l}(\theta) + O\left(\frac{F}{X^k Y^l} \sqrt{\frac{Q^{11}}{N^4}}\right),$$

$$\begin{aligned}
\Delta_2(f_1(x, y)) &= \frac{f^2(x, y)(h_1 h_3 h_5)^2}{x^2 y^8} \varphi_1(\theta) + O\left(\frac{F^2 Q^7}{N^5} \sqrt{\frac{Q^4}{N}}\right) \\
\left(\frac{\partial^2 f_1(x, y)}{\partial x^2}\right)^3 &\times \frac{\partial}{\partial y} \left( \frac{\Delta_2(f_1(x, y))}{\partial^2 f_1(x, y)/\partial y^2} \right) \\
&- \left( \frac{\partial^2 f_1(x, y)}{\partial x^2} \right)^2 \times \frac{\partial^2 f_1(x, y)}{\partial x \partial y} \times \frac{\partial}{\partial x} \left( \frac{\Delta_2(f_1(x, y))}{(\partial^2 f_1(x, y)/\partial y^2)} \right) \\
&= \frac{(f(x, y) h_1 h_3 h_5)^4}{x^8 y^{18}} \varphi_2(\theta) + O\left(\frac{F^4 Q^{14}}{X^7 N^7} \sqrt{\frac{Q^4}{N}}\right).
\end{aligned}$$

Let  $\varphi_{ij}(\theta_{ijk}) = 0$  ( $k = 1, 2, 3$ ),  $\varphi_i(\theta_{ik}) = 0$  ( $k = 1, \dots, 6$ ),  $\varphi_2(\theta_{2k}) = 0$  ( $k = 1, 2, \dots, 12$ ),  $\varphi_i(\theta_{ik}) = 0$  ( $i = 3, 4, 5$ ,  $k = 1, 2, \dots, 30$ ). For all  $i, j, k$  such that  $1/2 \leq \theta_{ijk} \leq 2$  and  $1/2 \leq \theta_{ik} \leq 2$  we divide the domain  $D_1$  into  $O(N^\epsilon)$  subdomains of the type  $H_i \leq h_i \leq 2H_i$ ,  $(y/x)\alpha_{ijk} \leq |\theta - \theta_{ijk}| \leq 2(y/x)\alpha_{ijk}$  and  $(y/x)\alpha_{ijk} \leq |\theta - \theta_{jk}| \leq 2(y/x)\alpha_{ik}$ , where  $1/Q^4 \leq \alpha_{i,j,k} \leq \alpha_{i,j,k+1} \leq \varepsilon_0$  and  $1/Q^4 \leq \alpha_{i,k} \leq \alpha_{i,k+1} \leq \varepsilon_0$  and a subdomain, which contains all the points of  $D_1$  such that  $|\theta - \theta_{i_0, k_0}| \leq \delta_1/Q^4 \equiv q_1 q_3 q_5 / h_1 h_3 h_5 Q^4$ . The number of integer points in the last subdomain  $D_2$  for each  $h$  is  $O(N\delta_1/Q^4)$  and  $(1/NQ^7) \sum_h \sum_{(x,y) \in D_2} e(f_1(x, y, h)) \ll \log^3 N/Q^4$ . We get the same estimate if  $\delta_1 \gg Q^4$ . We take one of the other subdomains,  $D_3$  such that  $\sum_{(x,y) \in D_3} e(f(x, y))$  is the largest, and consider all possible cases:

(1)  $\prod_{i=1}^3 \alpha_{20i} \ll \delta_1/Q^4$  and  $\prod_{i=1}^3 \alpha_{02i} \ll \delta_1/Q^4$ . If the domain is non-empty, then  $\alpha_{202} \geq \varepsilon_0$  or  $\alpha_{022} \geq \varepsilon_0$ , otherwise  $\varphi_{02}(\theta_0) = (\partial/\partial\theta)(\varphi_{20}(\theta_0 + \varepsilon_1(y/x))) = \varphi_{02}(\theta_0 + \varepsilon_2(y/x)) = (\partial/\partial\theta)(\varphi_{02}(\theta_0 + \varepsilon_0(y/x))) = 0$ , which contradicts (1). So,  $\alpha_{201} \ll \delta_1/Q^4$  or  $\alpha_{021} \ll \delta_1/Q^4$  and

$$S_2 = \frac{1}{NQ^7} \sum_h \sum_{(x,y) \in D_3} e(f_1(x, y, h)) \ll \frac{\log^3 N}{Q^4}.$$

(2) (a)  $\prod_{i=1}^3 \alpha_{20i} \ll \delta_1/Q^4$ ,  $\alpha_{11} \leq \varepsilon_0$  and  $\alpha_{021} \leq \varepsilon_0$

(b)  $\prod_{i=1}^3 \alpha_{02i} \ll \delta_1/Q^4$ ,  $\alpha_{11} \leq \varepsilon_0$ ,  $\alpha_{201} \leq \varepsilon_0$ .

In both cases it follows from (2) or (3) that  $\alpha_{202} \geq \varepsilon_0$  or  $\alpha_{022} \geq \varepsilon_0$  and  $S_2 \ll \log^3 N/Q^4$ .

(3) (a)  $\prod_{i=1}^3 \alpha_{20} \ll \delta_1/Q^4$ ,  $\alpha_{11} \leq \varepsilon_0$ ,  $\alpha_{021} \geq \varepsilon_0$ .

From (4) it follows that  $\alpha_{13} \geq \varepsilon_0$ ,  $\alpha_{203} \geq \varepsilon_0$  and  $\alpha_{201} \times \alpha_{202} \leq \delta_1/Q^4$ ;  $\alpha_{201} \leq \sqrt{\delta_1}/Q^2$ . If  $\alpha = \max \{\alpha_{202}, \alpha_{11}\}$  then  $\theta\sigma_{13} = c_1 + O(\alpha)$ ,  $\theta^2\sigma_{23} = c_2 + O(\alpha)$ ,  $\theta^3\sigma_{33} = c_2 + O(\alpha)$ ,  $Y/X \ll h_2/h_1, h_4/h_3, h_6/h_5 \ll Y/X$  and, from (27),  $h_4 = c_4(h_3 h_2/h_1) + O(\sqrt{\alpha} q_4)$ ,  $h_6 = c_5(h_5 h_2/h_1) + O(\sqrt{\alpha} q_6)$ ;  $S_2 \ll (1/NQ^7) \sum_h \sum_{x,y} \alpha_{201} \ll \alpha_{201} \cdot (\sqrt{\alpha} + 1/Q^2)(\sqrt{\alpha} + 1/Q) \ll \log^3 N/Q^4$ . If  $\alpha_{11} \gg \alpha$ , then from Lemma 4 it follows:

$$\begin{aligned}
S_2 &\ll \frac{1}{NQ^7} \sum_h \left( \sqrt{\frac{F^2 Q^7}{N^5}} \sum_{x,y} 1 + N \log N \sqrt{\frac{X^3}{F h_1 h_3 h_5}} \right. \\
&\quad \left. + \sqrt{\frac{F^2 Q^7}{N^3}} \frac{\log N}{Y} \sqrt{\frac{N^5 q_1^2 q_3^2 q_5^2}{F^2 h_1^2 h_3^2 h_5^2 Q^7 \alpha_{11}}} + X \log N + \log N \frac{F^2 Q^7}{N^3} \left( \frac{X^3}{F h_1 h_3 h_5} \right)^{3/2} \right)
\end{aligned}$$

$$\begin{aligned} &\ll \frac{1}{Q^2} \sqrt{\frac{F^2 Q^7}{N^5}} + \log N \sqrt{\frac{N^3}{F^2 Q^7}} + \frac{\log N}{Y} + \frac{\log N}{N} \sqrt{\frac{F^2 Q^7}{N^3}} \\ &\quad + \frac{\log N}{Y \alpha_{11}} \left( \sqrt{\alpha} + \frac{1}{Q^2} \right) \left( \sqrt{\alpha} + \frac{1}{Q} \right) \\ &\ll \sqrt{\frac{Q^3 F^2}{N^5}} + N \sqrt{\frac{N^3}{F^2 Q^7}} + \frac{\log N}{Y} \ll Q^{-4} \log N. \end{aligned}$$

(b)  $\prod_{i=1}^3 \alpha_{02i} \ll \delta_1/Q^4$ ,  $\alpha_{11} \geq \varepsilon_0$ ,  $\alpha_{201} \leq \varepsilon_0$ . Similarly to (a), it follows from (5) and (8) that

$$S_2 \ll Q^{-4} \log N.$$

(4)  $\prod_{i=1}^3 \alpha_{20i} \ll \delta_1 Q^{-4}$ ,  $\alpha_{021} \geq \varepsilon_0$ ,  $\alpha_{11} \geq \varepsilon_0$  (or  $\prod_{i=1}^3 \alpha_{02i} \ll \delta_1/Q^4$ ,  $\alpha_{201} \geq \varepsilon_0$ ,  $\alpha_{11} \geq \varepsilon_0$ ). Here  $\alpha_{201} \ll Q^{-4/3}$  (or  $\alpha_{021} \ll Q^{-4/3}$ ), and we can apply Lemma 4:

$$\begin{aligned} S_2 &\ll \frac{1}{NQ^7} \sum_{h,x,y} \sqrt{\frac{F^2 Q^7}{N^5}} + \log N \sqrt{\frac{N^3}{F^2 Q^7}} + \frac{\log^4 N}{NY} \sqrt{\frac{F^2 Q^7}{N^3}} \cdot \sqrt{\frac{N^5}{F^3 Q^7}} \\ &\quad + \frac{\log N}{NQ^7} \sqrt{\frac{F^2 Q^7}{N^3}} \sum_h \left( \frac{q_1 q_3 q_5}{h_1 h_3 h_5} \right)^{3/2} \\ &\ll \sqrt{\frac{F^2 Q^7}{N^5}} \cdot Q^{-4/3} + \sqrt[4]{\frac{N^3}{F^2 Q^7}} \log N + \frac{\log^4 N}{Y} + \frac{\log N}{N} \sqrt{\frac{F^2 Q^7}{Y^3}} \\ &\ll Q^{-4} \log^4 N. \end{aligned}$$

(5) (a)  $\prod_{i=1}^3 \alpha_{20i} \ll \delta_1/Q^4$ ,  $\alpha_{11} \geq \varepsilon_0$ ,  $\alpha_{021} \leq \varepsilon_0$ ,  $\prod_{i=1}^3 \alpha_{02i} \gg \delta_1 Q^{-4}$ . From (10) it follows that  $\alpha_{203} \geq \varepsilon_0$ . If  $\alpha_{202} \geq \varepsilon_0$ , then  $S_2 \ll Q^{-4} \log^3 N$ . If  $\alpha_{202} \leq \varepsilon_0$ , then  $\alpha_{201} \ll Q^{-2} \sqrt{\delta_1}$  and, from (1),  $\alpha_{022} \geq \varepsilon_0$ ; If  $\alpha = \max\{\alpha_{202}, \alpha_{021}\}$ , then, like in (3),  $h_6 = c_1(h_5 h_2/h_1) + O(\sqrt{\alpha} q_6)$ ,  $h_4 = c_2 h_3 h_2/h_1 + O(\sqrt{\alpha} q_4)$  and, if  $\alpha_{202} \leq \alpha_{201}$ , then from Lemma 4 it follows:

$$\begin{aligned} S_2 &\ll \gamma_1 + \frac{\log N}{Q^7} \sqrt{\frac{N^3}{F^2 Q^7 \alpha_{201}^2}} \sum_h 1 \\ &\ll \gamma_1 + \sqrt[4]{\frac{N^3}{F^2 Q^7 \alpha_{201}^2}} \times \left( \sqrt{\alpha_{201}} + \frac{1}{Q^2} \right) \times \left( \sqrt{\alpha_{201}} + \frac{1}{Q} \right) \\ &\ll Q^{-4} \log N \end{aligned}$$

if  $\alpha_{202} > \alpha_{201}$ , then

$$S_2 \ll \frac{1}{Q^7} \sum_h 1 \ll \alpha_{201} (\sqrt{\alpha_{202}} + Q^{-2}) (\sqrt{\alpha_{202}} + Q^{-1}) \ll Q^{-4} \log^3 N.$$

(b)  $\prod_{i=1}^3 \alpha_{02i} \ll \delta_1 Q^{-4}$ ,  $\alpha_{11} \geq \varepsilon_0$ ,  $\alpha_{201} \leq \varepsilon_0$ ,  $\prod_{i=1}^3 \alpha_{20i} \gg Q^{-4} \delta_1$ . Similarly to (a), from (11), (1) and (26) it follows that  $S_2 \ll Q^{-4} \log N$ .

(6)  $\prod_{i=1}^6 \alpha_{1i} \ll \delta_1 Q^{-4}$ ,  $\alpha_{201} \leq \varepsilon_0$ ,  $\alpha_{021} \leq \varepsilon_0$ . From (2), (3) and (6) it follows that  $\alpha_{202} \geq \varepsilon_0$ ,  $\alpha_{022} \geq \varepsilon_0$  and  $\alpha_{13} \geq \varepsilon_0$ ;  $\alpha \ll \sqrt{\delta_1}/Q^2$ . If to denote  $\alpha = \max\{\alpha_{11}, \alpha_{201}, \alpha_{021}\}$ , then, like in (3),  $1/Q^7 \sum_{h_1} \ll \alpha_{11} + 1/Q^2$  and, if  $\max\{\alpha_{201}, \alpha_{021}\} \ll \alpha$ , or if  $\alpha_{12} \gg \alpha$ , or if  $\alpha \ll Q^{-2}$ , then  $S_2 \ll Q^{-4} \log^3 N$ ;

if  $\alpha_{201} \gg \alpha$  or  $\alpha_{021} \gg \alpha$ , then from Lemma 4 with the use of (9) we obtain:

$$\begin{aligned} S_2 &\ll \sqrt{\frac{F^2 Q^7}{N^5}} \cdot \frac{1}{Q^2} + \sum_h \sqrt[4]{\frac{N^3 \log N}{F^2 Q^7 \alpha^2}} \log N + \sqrt{\frac{F^2 Q^7}{N^5}} \\ &\quad \times \min \left\{ \frac{1}{Y} \sqrt{\frac{N^5}{F^2 Q^7 \prod_{i=1}^6 \alpha_{1i}}}; \sqrt[4]{\frac{N^3}{F^2 Q^7}} \sqrt[3]{X^3 \sqrt{\frac{N^3}{F^2 Q^7}}} \right\} \\ &\ll Q^{-4} \log^2 N + \frac{1}{Y} \sqrt[12]{\frac{F^2 Q^7}{N^3}} \ll Q^{-4} \log^2 N. \end{aligned}$$

(7) (a)  $\prod_{i=1}^6 \alpha_{1i} \ll \delta_1/Q^4$ ,  $\alpha_{201} \leq \varepsilon_0$ ,  $\alpha_{021} \geq \varepsilon_0$ . From (7) it follows that  $\alpha_{13} \geq \varepsilon_0$ ,  $\alpha_{11} \ll \sqrt{\delta_1}/Q^2$  and like in (6) we can show that  $S_2 \ll Q^{-4} \log N$ .

(b)  $\prod_{i=1}^6 \alpha_{1i} \ll \delta_1/Q^4$ ,  $\alpha_{021} \leq \varepsilon_0$ ,  $\alpha_{201} \geq \varepsilon_0$ . Similarly to (a) with the use of (8) we get the estimate.

(8)  $\prod_{i=1}^6 \alpha_{1i} \ll \delta_1/Q^4$ ,  $\alpha_{021} \geq \varepsilon_0$ ,  $\alpha_{201} \geq \varepsilon_0$ . If  $\alpha_{13} \leq \varepsilon_0$ , then from (9) it follows that  $\alpha_{21} \geq \varepsilon_0$ ,  $\alpha_{11} \leq Q^{-2/3} \delta_1^{1/6}$  and, like in (6),  $S_2 \ll \gamma_1 + \sqrt{F^2 Q^7 / N^5 Q^{-2/3}} \ll \gamma_1$ . If  $\alpha_{13} \geq \varepsilon_0$ ,  $\alpha_{11} \gg \sqrt{Q^8/N}$ , then  $\prod_{i=1}^6 \alpha_{1i} \gg Q^8/N$  and, like in (6),

$$S_2 \ll Q^{-4} \log N + \frac{1}{X} \sqrt{\frac{F^2 Q^7}{N^5}} \sqrt{\frac{N^5}{F^2 Q^7 \prod_{i=1}^6 \alpha_{1i}}} \ll Q^{-4} \log N.$$

If  $\alpha_{13} \geq \varepsilon_0$ ,  $\alpha_{11} \ll \sqrt{Q^8/N}$ , then we apply Lemma 3:

$$\begin{aligned} S_2 &\ll \frac{1}{N Q^7} \sum_h \sum_y \left( \frac{1}{X} \sqrt[4]{\frac{F^2 Q^7}{N^3}} \sum_x 1 + X \sqrt[4]{\frac{N^3}{F^2 Q^7}} \right) \\ &\ll \sqrt{\frac{N^3}{F^2 Q^7}} + \frac{1}{X} \sqrt[4]{\frac{F^2 Q^7}{N^3}} \times \sqrt{\frac{Q^8}{N}} \ll Q^{-4} \log N. \end{aligned}$$

(9)  $\delta_1 Q^{-4} \ll \prod_{i=1}^3 \alpha_{20i} \ll \sqrt{N^3 Q^9 F^{-2}}$ ,  $\delta_1 Q^{-4} \ll \prod_{i=1}^3 \alpha_{02i} \ll \sqrt{N^3 Q^9 F^{-2}}$ ,  $\prod_{i=1}^6 \alpha_{1i} \gg \delta_1 Q^{-4}$ . Like in (1),  $\alpha_{202} \geq \varepsilon_0$  or  $\alpha_{022} \geq \varepsilon_0$ . Consider two cases:

(a)  $\alpha_{202} \geq \varepsilon_0$  and  $\alpha_{022} \geq \varepsilon_0$ . For each point  $(x, y) \in D_3$ ,  $\varphi_{20}(\theta) = 0$  and  $\varphi_{02}(\theta + \alpha\theta_0) = 0$ , where  $\alpha = \alpha_{201} + \alpha_{021}$ ,  $|\theta_0| \leq \theta$ .  $0 = R\varphi_{20}(\theta)$ ,  $\varphi_{02}(\theta + \alpha\theta_0) = \alpha_1 \alpha_2 \alpha_3 [\alpha_3^4 (a\alpha_1^2 + b\alpha_1 \alpha_2 + a\alpha_2^2) + \dots] = \alpha_1 \alpha_2 (a\alpha_1^2 + b\alpha_1 \alpha_2 + a\alpha_2^2) \alpha_3 \prod_{i=1}^4 (\alpha_3 - \alpha_i^2(\alpha_1, \alpha_2))$  where  $a = a_1 + O(\alpha)$ ,  $b = b_1 + O(\alpha)$ ,  $b_1 = b_1(c_{ij})$ ,  $a_1 = a_1(c_{ij})$ ,  $a_1 \neq 0$  (see (26)). If  $\beta \ll a\alpha_2^2 + b\alpha_1 \alpha_2 + a\alpha_2^2 \ll \beta$ , then  $\alpha_2 = c_1 \alpha_1 + O(\sqrt{\beta})$  and from (13) it follows that  $|\alpha_3 - \alpha_3^0(\alpha_1, \alpha_2)| \ll \sqrt{\alpha/\beta}$ . From  $\varphi_{20}(\theta) = \varphi_{02}(\theta + \alpha\theta_0) = 0$  it follows also that  $\alpha_2 = c_2 \theta + O(\sqrt{\beta} \theta)$ ,  $\alpha_3 = c_3 \theta + O(\sqrt{\beta} \theta)$  and  $\alpha_3 = c_4 \alpha_2 + O(\sqrt{\beta} \theta)$ . So,

$$\frac{1}{Q^7} \sum_h \sqrt{\frac{q_1 q_3 q_5}{h_1 h_3 h_5}} \ll \left( \sqrt{\beta} + \frac{1}{Q} \right) \left( \min \{ \sqrt{\beta}; \sqrt{\alpha/\beta} \} + \frac{1}{Q^2} \right) \ll \frac{1}{Q^2} + \sqrt{\alpha}.$$

Applying Lemma 4, we obtain:

$$\begin{aligned} S_2 &\ll \frac{1}{NQ^7} \sum_h \left( \sqrt{\frac{F^2 Q^7}{N^5}} \sum_{x,y} 1 + \sqrt[4]{\frac{N^3 q_1^2 q_3^2 q_5^2}{F^2 Q^7 h_1^2 h_3^2 h_5^2 \alpha^2}} + \frac{\log^4 N}{Y} + \frac{\log N}{N} \sqrt{\frac{FQ^7}{Y^3}} \right) \\ &\ll \frac{Q^4}{N} + \log N \sqrt{\frac{N^3}{F^2 Q^7}} + \frac{\log^4 N}{Y} + \frac{\log N}{N} \sqrt{\frac{FQ^7}{Y^3}} + \frac{1}{Q^4} \ll Q^{-4} \log N. \end{aligned}$$

(b)  $\alpha_{202} \leq \varepsilon_0$  or  $\alpha_{022} \leq \varepsilon_0$ . If  $\varepsilon_1 = \min \{\alpha_{202}, \alpha_{022}\}$ ,  $\varepsilon_2 = \max \{\alpha_{201}, \alpha_{021}, \varepsilon_1\}$ ,  $\varepsilon_3 = \max \{\alpha_{201}, \alpha_{021}\}$ , then, like before,

$$\frac{1}{Q^7} \sum_h \sqrt{\frac{q_1 q_3 q_5}{h_1 h_3 h_5}} \ll \left( \sqrt{\beta} + \frac{1}{Q} \right) \left( \min \{ \sqrt{\beta}; \sqrt{\varepsilon_3 / \beta} \} + \frac{1}{Q^2} \right) \ll \frac{1}{Q^2} + \varepsilon_2^{1/2}.$$

From (14) and (15), it follows also that  $\alpha_1 = c_1 \theta + O(\varepsilon_2 \theta)$ ,  $\alpha_2 = c_2 \theta + O(\varepsilon_3 \theta)$ ,  $\alpha_3 = c_3 \theta + O(\varepsilon_2 \theta)$  and

$$\frac{1}{Q} \sum_h \sqrt{\frac{q_1 q_3 q_5}{h_1 h_3 h_5}} \ll \left( \varepsilon_2 + \frac{1}{Q} \right) \left( \varepsilon_2 + \frac{1}{Q^2} \right) \ll \frac{1}{Q^2} + \varepsilon_2^2.$$

Applying Lemma 4, like in (a) we have:

$$\begin{aligned} S_2 &\ll Q^{-4} \log N + \frac{1}{NQ^7} \sum_h \sqrt[4]{\frac{N^3 q_1^2 q_3^2 q_5^2}{F^2 Q^7 h_1^2 h_3^2 h_5^2}} \cdot \frac{1}{\sqrt{\varepsilon_2 \varepsilon_3}} \\ &\ll Q^{-4} \log N + \sqrt[4]{\frac{N^3}{F^2 Q^7}} \cdot \frac{1}{\sqrt{\varepsilon_2 \varepsilon_3}} \cdot \min \{ \varepsilon_2^2; \varepsilon_3^{1/2} \} \\ &\ll Q^{-4} \log N + \sqrt[4]{N^3 / (F^2 Q^7)} \cdot Q^{2/5} \ll Q^{-4} \log N. \end{aligned}$$

(10)  $\prod_{i=1}^3 \alpha_{20i} \gg \sqrt{N^3 Q^9 / F^2}$  (or  $\prod_{i=1}^3 \alpha_{02i} \gg \sqrt{N^3 Q^9 / F^2}$ ),  $\prod_{j=1}^6 \alpha_{1j} \gg 1/Q^4$  and for some  $i, j, k$   $\alpha_{ijk} \ll \sqrt{N^3 / F^2 Q^{15}}$  or  $\alpha_{ij} \ll \sqrt{N^6 / F^2 Q^{15}}$ , or  $\prod_{j=1}^6 \alpha_{1j} \ll N^5 / F^2 Q^{15}$ , or  $|h_1 h_2 \cdots h_6| \ll Q^7 \cdot \sqrt{N^5 / F^2 Q^{15}}$ .

Applying Lemma 4, we obtain:

$$S_2 \ll Q^{-4} \log N + (NQ^7)^{-1} \sum_h F \sqrt{Q^7 / N^3} \cdot \left( \prod_{j=1}^6 \alpha_{1j} \right)^{-1/2} \sum_{x,y} 1 \ll Q^{-4} \log N,$$

because  $\sum_{x,y} 1 \ll N$  and  $\sum_{x,y} 1 \ll \sqrt{N^5 / F^2 Q^{15}}$  if, say,  $\alpha_{ijk} \ll \sqrt{N^5 / F^2 Q^{15}}$ .

(11)  $\prod_{i=1}^3 \alpha_{20i} \gg \sqrt{N^3 Q^9 / F^2}$  (or  $\prod_{i=1}^3 \alpha_{02i} \gg \sqrt{N^3 Q^9 / F^2}$ ),  $\prod_{j=1}^6 \alpha_{1j} \gg N^5 / F^2 Q^{15} = \delta_0$ ,  $\alpha_{ij} \gg \sqrt{\delta_0}$ ,  $\alpha_{i,j,k} \gg \sqrt{\delta_0}$ ,  $|h_1 \cdots h_6| \gg Q^7 \sqrt{\delta_0}$ .

Applying Lemma 4, we obtain:

$$\begin{aligned} S_2 &\ll Q^{-4} \log N + (NQ^7)^{-1} \sum_h q_1 q_3 q_5 \left( h_1 h_3 h_5 \cdot F \cdot \sqrt{Q^7 N^{-3}} \cdot \sqrt{\prod_{i=1}^6 \alpha_{1i}} \right)^{-1} \\ &\quad \times \left| \sum_{y_1, y_2 \in \mathcal{D}_1} e(g(y_1, y_2)) \right|, \end{aligned}$$

where  $g(y_1, y_2) = f(\varphi_1, \varphi_2) - y_1 \varphi_1 - y_2 \varphi_2$ ,  $\mathcal{D}_1$ ,  $\varphi_1$ ,  $\varphi_2$  are defined as in Lemma 4,

$$\sum_{(y_1, y_2) \in \mathcal{D}_1} 1 \ll (F h_1 h_3 h_5)^2 (q_1 q_5)^{-2} Q^7 N^{-3} \prod_{i=1}^6 \alpha_{1i} \sum_{(x, y) \in \mathcal{D}} 1.$$

One can verify, that for  $k + l \geq 2$

$$(27) \quad \frac{\partial^{k+l} g(y_1, y_2)}{\partial y_1^k \partial y_2^l} = \Phi_{k,l}(f(\varphi_1, \varphi_2)) \cdot (\mathcal{A}(f(\varphi_1, \varphi_2)))^{3-2k-2l}$$

where  $\Phi_{k,l}$  and  $\mathcal{A}$  are defined as in the notation for the theorem. From (18) we get that either  $\alpha_{7,23} \geq \varepsilon_0$  or  $\alpha_{8,23} \geq \varepsilon_0$ . We consider three cases.

(a)  $|\alpha_{7,23}| \leq \varepsilon_0$ . Then  $\alpha_{8,23} \geq \varepsilon_0$  and  $\prod_{j=1}^{30} \alpha_{8,j} \gg \delta_0^{11}$ . Also, from (17) we obtain that either  $\alpha_{6,6} \geq \varepsilon_0$  (and  $\prod_{i=1}^{30} \alpha_{6,i} \gg \delta_0^3$ ) or  $\alpha_{4,6} \geq \varepsilon_0$  (and  $\prod_{i=1}^{30} \alpha_{4,i} \gg \delta_0^3$ ). Applying three times Lemma 5 with  $n = 1$  to the sum over  $y_2$ , we obtain:

$$(28) \quad \begin{aligned} |S_3|^8 &= \left| \sum_{(y_1, y_2) \in \mathcal{D}} e(g(y_1, y_2)) \right|^8 \\ &\ll Q_1^{-4} \cdot \left( \sum_{(y_1, y_2)} 1 \right)^8 + \left( \sum_{(y_1, y_2)} 1 \right)^7 \cdot Q_1^{-7} \sum_{l_1=1}^{Q_1} \sum_{l_2=1}^{Q_1^2} \sum_{l_3=1}^{Q_1^4} \left| \sum_{y_1, y_2} e(g_1(y_1, y_2)) \right| \end{aligned}$$

where  $Q_1 = [\delta_0^{-1}]$ ,  $g_1(y_1, y_2) = \int_0^1 \int_0^1 \int_0^1 g(y_1, y_2 + l_1 t_1 + l_2 t_2 + l_3 t_3) dt_1 dt_2 dt_3$ , and the last sum is over  $y_1, y_2$  such that  $(y_1, y_2) \in \mathcal{D}_1$ ,  $(y_1, y_2 + h_1 + h_2 + h_3) \in \mathcal{D}_1$ . Using (27), we get that either

$$\left| \frac{\partial^2 g_1(y_1, y_2)}{\partial y_1^2} \right| \gg \delta_0^3 l_1 l_2 l_3 \cdot \left( \prod_{i=1}^6 \alpha_{1i} \right)^{-7} \cdot (q_1 q_3 q_5 / h_1 h_3 h_5)^4 \cdot N^8 y F^{-4} Q^{-14}$$

or

$$\left| \frac{\partial^2 g_1(y_1, y_2)}{\partial y_2^2} \right| \gg \delta_0^3 l_1 l_2 l_3 \cdot \left( \prod_{i=1}^6 \alpha_{1i} \right)^{-7} \cdot (q_1 q_3 q_5 / h_1 h_3 h_5)^4 \cdot y^5 N^6 F^{-4} Q^{-14}.$$

Also, from  $\prod_{j=1}^{30} \alpha_{8,j} \gg \delta_0^{11}$  we obtain

$$|\mathcal{A}(g_1(y_1, y_2))| \gg \delta_0^{11} l_1^2 l_2^2 l_3^2 \cdot \left( \prod_{i=1}^6 \alpha_{1i} \right)^{-14} \cdot (q_1 q_3 q_5 / h_1 h_3 h_5)^8 \cdot N^{14} y^6 F^{-8} Q^{-28};$$

trivially,

$$|\mathcal{A}(g_1(y_1, y_2))| \ll l_1^2 l_2^2 l_3^2 \cdot \left( \prod_{i=1}^6 \alpha_{1i} \right)^{-14} \cdot N^{14} y^6 F^{-8} Q^{-28}.$$

Applying Lemma 4, we get

$$\begin{aligned} |S_3|^8 &\ll \left( \sum_{y_1, y_2} 1 \right)^8 \cdot \left[ Q_1^{-4} + Q_1^{-7} \sum_{l_1, l_2, l_3} l_1 l_2 l_3 \cdot \left( \prod_{i=1}^6 \alpha_{1i} \right)^{-7} N^7 y^3 F^{-4} Q^{-14} \right] \\ &\quad + \left( \sum_{y_1, y_2} 1 \right)^7 Q_1^{-7} \sum_{l_1, l_2, l_3} \left\{ F \sqrt{Q^7 / N^3} \cdot X^{-1} \right. \\ &\quad \times \left[ \delta_0^3 l_1 l_2 l_3 \cdot \left( \prod_{i=1}^6 \alpha_{1i} \right)^{-7} \cdot (q_1 q_3 q_5 / h_1 h_3 h_5)^4 \cdot y N^8 F^{-4} Q^{-14} \right]^{-1/2} \log^2 N \\ &\quad + \left[ l_1 l_2 l_3 \cdot \left( \prod_{i=1}^6 \alpha_{1i} \right)^{-5} \cdot (q_1 q_3 q_5 / h_1 h_3 h_5)^8 \cdot F^{-3} N y^2 \cdot (Q^7 / N^3)^{-3/2} + 1 \right] \\ &\quad \times \left[ \delta_0^{11} l_1^2 l_2^2 l_3^2 \cdot \left( \prod_{i=1}^6 \alpha_{1i} \right)^{-14} \cdot (q_1 q_3 q_5 / h_1 h_3 h_5)^8 \cdot N^{14} y^6 F^{-8} Q^{-28} \right]^{-1/2} \log^2 N \Big\} \\ &\ll Q_1^{-4} \left( \sum_{y_1, y_2} 1 \right)^8 \log^2 N \end{aligned}$$

and

$$S_2 \ll Q^{-4} \log^2 N.$$

(b)  $\alpha_{7,23} \geq \varepsilon_0$ . Then  $\alpha_{7,23} \geq \varepsilon_0$  and  $\prod_{j=1}^{60} \alpha_{7,j} \gg \delta_0^{11}$ . Also, from (17) we get that either  $\alpha_{8,6} \geq \varepsilon_0$  (and  $\prod_{i=1}^{30} \alpha_{8,i} \gg \delta_0^3$ ) or  $\alpha_{5,6} \geq \varepsilon_0$  (and  $\prod_{i=1}^{30} \alpha_{5,i} \gg \delta_0^3$ ). Applying three times Lemma 5 with  $n = 1$  (twice to the sum over  $y_2$  and once to the sum over  $y_1$ ) we obtain the inequality similar to (28) with  $g_1(y_1, y_2) = \int_0^1 \int_0^1 \int_0^1 g(y_1 + l_1 t_1, y_2 + l_2 t_2 + l_3 t_3) dt_1 dt_2 dt_3$ . Arguing similarly to (a) we can show that  $S_2 \ll Q^{-4} \log^2 N$ .

(c)  $\alpha_{7,23} \geq \varepsilon_0$ ,  $\alpha_{8,23} \geq \varepsilon_0$ . Using (17), we get that for some  $j \in [3, 6]$   $\alpha_{j,6} \geq \varepsilon_0$ , and similar reasonings as in (a) (if  $j = 4$  or  $j = 6$ ) or in (b) (if  $j = 3$  or  $j = 5$ ) will show that

$$S_2 \ll Q^{-4} \log^2 N.$$

II. If  $N^{15/33} \leq Y \leq N^{35/78}$ , then we apply Lemma 5 one time with  $n = 1$  and two times with  $n = 2$

$$S \ll \frac{1}{\sqrt[8]{Q}} + \sqrt[8]{\frac{1}{NQ^7} \left( \sum_{h_0=1}^{q_1-1} \sum_{|h_i|=1}^{q_2-1} \sum_{x,y \in D_1}^{q_3-1} e(f_1(x, y, h)) + \Sigma' \right)}.$$

Where  $Q^2 = q_1 q_2 = \sqrt{q_3 q_4}$ ,  $q_1/X = q_2/Y$ ,  $q_3/X = q_4/Y$ ;  $Q \ll N^{-1/12}$ ;  $\delta \ll \sqrt[8]{Q^4/N}$ ,  $Q$  is as in I,

$$f_1(x, y, h) = \int_0^1 \int_0^1 \int_0^1 \frac{\partial^3}{\partial t_1 \partial t_2 \partial t_3} f(x + h_0 t_1 + h_1 t_2 + h_3 t_3, y + h_2 t_2 + h_4 t_3) dt_1 dt_2 dt_3$$

$$D_1 \equiv D_1(h) = \{x, y; (x + h_0 t_1 + h_1 t_2 + h_3 t_3, y + h_2 t_2 + h_4 t_3) \in D, 0 \leq t_i \leq 1\}.$$

$\Sigma'$  is the sum over  $h_i$  such that  $\sum_{i=0}^4 |h_i| > 0$ ,  $h_j = 0$ . It will be seen later that  $\Sigma'$  can be estimated like the sum

$$S_1 = (NQ^7)^{-1} \sum_h \sum_{(x,y) \in D_1} e(f_1(x, y, h))$$

and the estimate is smaller.

$$\begin{aligned} \frac{\partial^{k+l} f_1(x, y, h)}{\partial x^k \partial y^l} &= h_0 [h_1 h_3 f_{x^{k+3} y^l}(x, y) + (h_1 h_4 + h_2 h_3) f_{x^{k+2} y^{l+1}}(x, y) \\ &\quad + h_2 h_4 f_{x^{k+1} y^{l+2}}(x, y)] \\ &= \frac{f(x, y) h_1 h_3 h_0}{x^{k+1} y^{l+2}} \psi_{k,l}(\theta) + O\left(\frac{FQ^4}{X^{k+1} Y^l N} \sqrt{\frac{Q^4}{N}}\right). \end{aligned}$$

Let  $\psi_{k,l}(\theta_{k,l,i}) = 0$ ,  $\psi_1(\theta_{1i}) = 0$ ,  $\varphi_2^1(\theta_{2i}) = 0$ . For  $1/3 \leq \theta_{kli} \leq 3$ ,  $1/3 \leq \theta_{ij} \leq 3$  and each  $h$  we divide the domain  $D_1$  on  $O(N^\epsilon)$  subdomains of the type  $\alpha_{kli} \leq \theta - \theta_{kli} \leq 2\alpha_{kli}$  ( $k, l = 0, 1, 2$ ;  $i = 1, 2$ ),  $\alpha_{ki} \leq \theta - \theta_{ki} \leq 2\alpha_{ki}$  ( $k = 1, 2$ ;  $i = 1, 2, \dots, 8$ ) and subdomain where  $|\theta - \theta_{ki}| \ll \delta_2/Q^4 \equiv (q_1 q_3 / h_1 h_3) Q^{-4}$  or  $|\theta - \theta_{kli}| \ll \delta_2/Q^4$ . The sum over  $h$  and  $(x, y)$  from the last subdomain is  $\ll Q^{-4} \ln^3 N$ . If  $\delta_2 \gg Q^4$ , then we get the same estimate.

We take one of the remaining subdomains,  $D_2$ , such that  $|\sum_{(x,y) \in \mathcal{D}_2} e(f_1(x, y))|$  is the largest, and like in I, we consider all possible cases:

(1)  $\alpha_{201}\alpha_{202} \ll \delta_2 Q^{-4}$  and  $\alpha_{021} \leq \varepsilon_0$  (or  $\alpha_{201} \leq \varepsilon_0$  and  $\alpha_{021}\alpha_{022} \ll \delta_2 Q^{-4}$ ). From (18)–(19) it follows that  $\alpha_{202} \geq \varepsilon_0$  (or  $\alpha_{022} \geq \varepsilon_0$ ) and  $S_1 = (1/NQ^7) \sum_h \sum_{x,y \in D_2} e(f_1(x, y)) \ll \log^3 N/Q^4$ .

(2)  $\alpha_{201}\alpha_{202} \ll \delta^2 Q^{-4}$  (or  $\alpha_{021}\alpha_{022} \ll \delta_2 Q^{-4}$ ) and  $\alpha_{11} \leq \varepsilon_0$ . With the use of (20)–(21) we get  $S_1 \ll Q^{-4} \log^3 N$ .

(3)  $\alpha_{201}\alpha_{202} \ll \delta_2 Q^{-4}$  (or  $\alpha_{021}\alpha_{022} \ll \delta_2 Q^{-4}$ ),  $\alpha_{11} \geq \varepsilon_0$  and  $\alpha_{021} \geq \varepsilon_0$  (or  $\alpha_{201} \geq \varepsilon_0$ ). From Lemma 4 we obtain:

$$S_1 \ll \left( \frac{FQ^2}{N^2 X} + \sqrt{\frac{NX}{FQ^4}} + \frac{1}{Y} + \frac{1}{Q^4} + \sqrt{\frac{FQ^4}{N^4 X}} \right) \log^7 N \ll Q^{-4} \log^7 N.$$

(4)  $\prod_{i=1}^4 \alpha_{1i} \ll \delta_2 Q^{-4}$ ,  $\alpha_{201} \leq \varepsilon_0$  (or  $\alpha_{021} \leq \varepsilon_0$ ). From (20)–(21) it follows that  $\alpha_{12} \geq \varepsilon_0$  and  $S_1 \ll Q^{-4} \log^3 N$ .

(5)  $\delta_2/Q^4 \ll \alpha_{201}\alpha_{202} \ll NXQ^4/F$  and  $\delta_2 Q^{-4} \ll \alpha_{021}\alpha_{022} \ll NXQ^4 F^{-1}$ . If  $\alpha = \max\{\alpha_{201}, \alpha_{021}\}$ , then  $\alpha_{11} \geq \varepsilon_0$ ,  $\sigma_{12} = c_1 \theta + O(\alpha \theta)$ ,  $\sigma_{22} = c_2 \theta + O(\alpha \theta)$  (because of (29) and (15)),  $\alpha_2 = c_3 \alpha_1 + O(\sqrt{\alpha} \theta)$ ,

$$\frac{1}{Q^7} \sum_h (h_1 h_3)^{-1/2} \ll (\sqrt{\alpha} + Q^{-2}) (q_1 q_3)^{-1/2} \ll \sqrt{\alpha} (q_1 q_3)^{-1/2}$$

and from Lemma 4 it follows that

$$S_1 \ll \left( \alpha^{3/2} \frac{FQ^4}{N^2 X} + \sqrt{\frac{NX}{FQ^4}} + \frac{1}{Y} + \frac{1}{Q^4} \right) \log^7 N \ll Q^{-4} \log^7 N.$$

(6)  $\delta_2 Q^{-4} \ll \prod_{i=1}^4 \alpha_{1i} \ll Q^{-1/2}$ ,  $\alpha_{201} \geq \varepsilon_0$ ,  $\alpha_{021} \geq \varepsilon_0$ . From (23) it follows that  $\alpha_{14} \geq \varepsilon_0$ ,  $\alpha_{11} \ll Q^{-1/6}$ , and, applying Lemma 4, we obtain:

$$S_1 \ll \left( \frac{FQ^{28/6}}{N^2 X} + \sqrt{\frac{NX}{FQ^4}} + \frac{Q^2}{X} + Q^{-4} \right) \log^7 N \ll Q^{-4} \log^7 N.$$

(7)  $\prod_{i=1}^4 \alpha_{1i} \gg Q^{-1/2}$ ,  $\alpha_{201}\alpha_{202} \gg NXQ^4 F^{-1}$ ,  $\alpha_{021}\alpha_{022} \gg NNQ^4 F^{-1}$ . Using Lemma 4, we obtain

$$(29) \quad S_1 \ll Q^{-4} \log^2 N + (NQ^7)^{-1} \sum_h \left[ \left( \prod_{i=1}^4 \alpha_{1i} \right) \cdot (h_0 h_1 h_3)^2 \cdot (q_1 q_3)^{-2} \times F^2 Q^6 X^{-2} N^{-4} \right]^{-1/2} \left| \sum_{y_1, y_2} e(g(y_1, y_2)) \right|,$$

where  $g(y_1, y_2) = f(\varphi_1, \varphi_2) - y_1 \varphi_1 - y_2 \varphi_2$ ,  $\varphi_1 = \varphi_1(y_1, y_2)$ ,  $\varphi_2 = \varphi_2(y_1, y_2)$  are defined as in Lemma 4,  $\sum_{y_1, y_2} 1 \ll (\prod_{i=1}^4 \alpha_{1i}) \cdot (h_0 h_1 h_3)^2 (q_1 q_3)^{-2} \times F^2 Q^6 X^{-2} N^{-4} \sum_{(x,y) \in \mathcal{D}_2} 1$  and  $\sum_{y_1} 1 \ll FQ^3 X^{-2} N^{-1}$ . If  $\prod_{i=1}^4 \alpha_{2i} \ll \delta_2 Q^{-5/6}$ , then, using (24), we get  $\alpha_{26} \geq \varepsilon_0$ ,  $\alpha_{21} \ll \delta_2 Q^{-1/6}$ ,  $\sum_{(x,y) \in \mathcal{D}_2} 1 \ll N \delta_2 Q^{-1/6}$  and, estimating  $S_2 = |\sum_{y_1, y_2} e(g(y_1, y_2))|$  trivially, we obtain:  $S_1 \ll Q^{-4} \log^2 N$ .

We obtain a similar result if  $\delta_2 \ll Q^{-1/6}$ . If  $\prod_{i=1}^{14} \alpha_{2i} \gg \delta_2^5 Q^{-5/6}$  and  $\delta_2 \gg Q^{-1/6}$ , then we apply van der Corput's theorem (see, for example, Lemma 5.13, page 93, [2]): if  $M_4^{-1} \leq f^{(4)}(x) \leq A M_4^{-1}$ , then

$$\left| \sum_{a \leq x \leq b} e(f(x)) \right| \ll (b-a) M_4^{-1/14} A^{1/14} + (b-a)^{3/4} M_4^{1/14}$$

(which can be obtained by applying Lemma 5 twice with the appropriate choice of  $q$ , and after that Lemma 2). We obtain:

$$\begin{aligned} \left| \sum_{y_1, y_2} e(g(y_1, y_2)) \right| &\leq \sum_{y_1} \left| \sum_{y_2} e(g(y_1, y_2)) \right| \\ &\ll A^{1/14} M_4^{-1/14} \sum_{y_1, y_2} 1 + M_4^{1/14} \sum_{y_1} \left( \sum_{y_2} 1 \right)^{3/4} \\ &\ll A^{1/14} M_4^{-1/14} \sum_{y_1, y_2} 1 + M_4^{1/14} \left( \sum_{y_1} 1 \right)^{1/4} \left( \sum_{y_1, y_2} 1 \right)^{3/4}, \end{aligned}$$

where

$$A M_4^{-1} = \sup_{y_1, y_2} \left| \frac{\partial^4 g(y_1, y_2)}{\partial y_2^4} \right| \ll \left( \prod_{i=1}^4 \alpha_{1i} \right)^{-5} \cdot (Q q_1 q_3 / h_0 h_1 h_3)^{-5} \cdot y (F Q^4)^{-3} N^6$$

and

$$M_4^{-1} = \inf_{y_1, y_2} \left| \frac{\partial^4 g(y_1, y_2)}{\partial y_2^4} \right| \gg \left( \prod_{i=1}^4 \alpha_{1i} \right)^{-5} \left( \prod_{i=1}^{14} \alpha_{2i} \right) \cdot (Q q_1 q_3 / h_0 h_1 h_3)^{-2} y N^6 Q^{-12}.$$

Putting the estimates into (29), we obtain  $S_1 \ll Q^{-4} \log^2 N$ .

III. If  $Y \ll N^{15/38}$ , we apply Lemma 5 three times with  $n = 1$ :

$$S \ll \frac{1}{\sqrt[8]{Q}} + \sqrt[8]{\frac{1}{N Q^7} \left| \sum_{h_1=1}^{Q-1} \sum_{h_2=1}^{Q^2-1} \sum_{h_3=1}^{Q^4-1} \sum_{x,y} e(f(x, y)) \right|},$$

where

$$f_1(x, y) = \int_0^1 \int_0^1 \int_0^1 \frac{\partial^3}{\partial t_1 \partial t_2 \partial t_3} f(x + h_1 t_1 + h_2 t_2 + h_3 t_3, y) dt_1 dt_2 dt_3.$$

Applying Lemma 4, we obtain:

$$S_1 \ll \frac{1}{Q^4} + \frac{F Q^7}{X^3 N} + \sqrt{\frac{X^8}{F Q^7}},$$

we can choose  $Q$  such that

$$S_1 \ll \left[ \left( \frac{F}{N^{107/38}} \right)^{4/11} + N^{-1/3} + \sqrt[8]{\frac{N^5}{F^4}} \right] \ln^7 N.$$

This completes the proof of the theorem:

$$S_1 \ll \left( \frac{N^{61/38}}{F} + \frac{F}{N^{85/38}} \right) \ln^7 N.$$

### 3. Consequences of the theorem.

COROLLARY 1.  $A(R) \ll R^{(35/108)+\epsilon}$ .

*Proof.* Like in [1], from the theorem it follows:

$$\mathcal{A}(R) \ll \frac{R}{V} + \frac{R^{1+\varepsilon}}{V^{3/2}} \frac{V^2}{R} \left( \frac{V^{42/19}}{R^{61/38}} + \frac{R^{85/38}}{V^{68/19}} \right)^{1/8} \ll R^{(35/108)+\varepsilon}$$

if  $V = R^{73/108}$ .

**COROLLARY 2.**  $\zeta(1/2 + it) \ll t^{(35/216)+\varepsilon}$ .

*Proof.* Like in [1];

$$\zeta\left(\frac{1}{2} + it\right) \ll \frac{t^\varepsilon}{\sqrt{X}} \sum_{X \leq x \leq X_1} |x^{-it}| + 1,$$

where  $X_1 \leq 2X \leq \sqrt{t}$ . If  $X \ll t^{137/324}$ , then

$$\zeta\left(\frac{1}{2} + it\right) \ll \sqrt{X} \cdot \sqrt[14]{\frac{t}{X^4}} + X^{1/4} \sqrt[14]{\frac{t}{X^4}} t^\varepsilon \ll t^{(35/216)+\varepsilon};$$

if  $X \gg t^{137/324}$ , then with the use of theorem we get that

$$\begin{aligned} \zeta\left(\frac{1}{2} + it\right) &\ll \frac{t^\varepsilon}{\sqrt{X}} \left( \frac{X}{\sqrt{q}} + \sqrt[4]{\frac{X^5}{qt}} + \sqrt{X} \right. \\ &\quad \left. + \sqrt[4]{\frac{X^5}{tq^3}} \sqrt{\frac{tq^2}{X^2} \sqrt[8]{t^{-61/38} \frac{tq^{42/19}}{X}} + t^{85/38} \frac{tq^{-68/19}}{X}} \right) \end{aligned}$$

and if we choose  $q = t^{19/108}$ ,

$$\zeta\left(\frac{1}{2} + it\right) \ll t^{(35/216)+\varepsilon}.$$

---

Mathematical papers intended for publication in the *Pacific Journal of Mathematics* should be in typed form or offset-reproduced, (not dittoed), double spaced with large margins. Please do not use built up fractions in the text of the manuscript. However, you may use them in the displayed equations. Underline Greek letters in red, German in green, and script in blue. The first paragraph or two must be capable of being used separately as a synopsis of the entire paper. Please propose a heading for the odd numbered pages of less than 35 characters. Manuscripts, in triplicate, may be sent to any one of the editors. Please classify according to the scheme of Math. Reviews, Index to Vol. 39. Supply name and address of author to whom proofs should be sent. All other communications should be addressed to the managing editor, or Elaine Barth, University of California, Los Angeles, California, 90024.

50 reprints to each author are provided free for each article, only if page charges have been substantially paid. Additional copies may be obtained at cost in multiples of 50.

---

The *Pacific Journal of Mathematics* is issued monthly as of January 1966. Regular subscription rate: \$102.00 a year (6 Vols., 12 issues). Special rate: \$51.00 a year to individual members of supporting institutions.

Subscriptions, orders for numbers issued in the last three calendar years, and changes of address should be sent to Pacific Journal of Mathematics, P.O. Box 969, Carmel Valley, CA 93924, U.S.A. Old back numbers obtainable from Kraus Periodicals Co., Route 100, Millwood, NY 10546.
