SUP-CHARACTERIZATION OF STRATIFIABLE SPACES

Carlos R. Borges and Gary Fred Gruenhage
SUP-CHARACTERIZATION OF
STRATIFIABLE SPACES
C. R. BORGES AND G. GRUENHAGE

We prove that a $T_1$-space $(X, \tau)$ is stratifiable if and only if, for each $U \in \tau$, one can find a continuous function $f_U : X \to I$ such that $f_U^{-1}(0) = X - U$ and, for each $\mathcal{U} \subset \tau$, $\sup_{U \in \mathcal{U}} f_U$ is continuous. This result is closely related to characterizations of metrizable and paracompact spaces, by J. Nagata, and J. Guthrie and M. Henry.

1. Introduction. J. Nagata [4, Theorem 5] and J. Guthrie and M. Henry [2, Theorem 2] have characterized metrizable spaces in terms of collections of real-valued functions with continuous “sups” and “infs”. Nagata’s theorem can be reformulated as follows:

**Theorem (Nagata).** A $T_1$-space $X$ is metrizable if and only if there is a family $\mathcal{F}$ of functions from $X$ into $[0, 1]$ such that

(a) for each $\mathcal{F}' \subset \mathcal{F}$, $\sup \mathcal{F}'$ and $\inf \mathcal{F}'$ are continuous;

(b) $\{ f^{-1}([\epsilon, 1]) : \epsilon > 0, f \in \mathcal{F} \}$ is a base for $X$.

In the paper of Guthrie and Henry, it is shown that the Sorgenfrey line admits a collection $\mathcal{F}$ of functions satisfying (b) such that “infs” from $\mathcal{F}$ are continuous. One might, therefore, expect that nothing interesting happens if just sups are required to be continuous. In this paper we show instead that a characterization of stratifiable spaces is obtained. Our main result is the following:

**Theorem 1.** The following are equivalent for a $T_1$-space $(X, \tau)$:

(a) $X$ is stratifiable;

(b) There exists a family $\mathcal{F} = \{ f_U : U \in \tau \}$ of functions from $X$ into $[0, 1]$ such that

(i) for each $\mathcal{U} \subset \tau$, $\sup_{U \in \mathcal{U}} f_U$ is continuous;

(ii) for each open set $U$, $f_U^{-1}(0) = X - U$.

(c) There exists a collection $\mathcal{G} = \bigcup_{n \in \omega} \mathcal{G}_n$ such that

(i) for each $n \in \omega$ and $\mathcal{F}' \subset \mathcal{G}_n$, $\sup \mathcal{F}'$ is continuous;

(ii) $f^{-1}([\epsilon, 1]) : \epsilon > 0, f \in \mathcal{F}$ is a base for $X$.

Observe that the property that one obtains by just requiring sups to be continuous in Nagata’s theorem is formally weaker than (b) and stronger than (c). However, by this theorem all these properties are equivalent.

279
2. Preliminaries. It turns out not to be difficult to prove that a space satisfying (c) is stratifiable. Proving (a) \(\Rightarrow\) (b) is the hard part. It involves building a very strong type of "stratification", which is done in Lemma 2.3, the proof of which is the purpose of this section.

If \((X, \tau)\) is a stratifiable space, then for each \(U \in \tau\) and \(x \in U\), one can assign an open neighborhood \(U_x\) of \(x\) satisfying

\[ U_x \cap V_y \neq \emptyset \Rightarrow x \in V \quad \text{or} \quad y \in U. \]

(cf. Lemma 4.2 of [1]). Let \(U_x^1 = U_x\) and \(U_x^n = (U_x^{n-1})_x\), for \(n = 2, 3, \ldots\).

A neiborget \(R\) of a space \(X\) is a binary relation on \(X\) such that \(R[x] = \{y: x R y\}\) is a neighborhood of \(x\) for each \(x \in X\). If \(\mathcal{G}\) is a collection of subsets of \(X\), let \(\mathcal{G}_x = \{A \in \mathcal{G} | x \in A\}\). If \(\mathcal{V}\) is a cover of \(X\), let \(\mathcal{V}(x) = \bigcap \mathcal{V}_x\). For any point finite open cover \(\mathcal{V}\) of \(X\) and \(k = 2, 3, \ldots\), let \(N^k(\mathcal{V})\) be the neiborget defined by \(N^k(\mathcal{V})[x] = (\mathcal{V}(x))_{x}^k\). Let \(N(\mathcal{V})\) be the neiborget defined by \(N(\mathcal{V})[x] = \mathcal{V}(x)\). By Corollary 4.7 of [3], there exists a point-finite open cover \(\mathcal{V}'\) of \(X\) such that \(N(\mathcal{V}') \subseteq (N^3(\mathcal{V}))^3\) (recall that, for relations \(R \subseteq X \times X\), \(R^\prime = R^{-1} \circ R\)).

**Lemma 1.1.** \((N^3(\mathcal{V}))^3\) and \(N(\mathcal{V}')\) satisfy the following:

(a) \(y \in N(\mathcal{V}')[x] \Rightarrow N(\mathcal{V})[y] \subseteq N(\mathcal{V}')[x]\),

(b) each \(N(\mathcal{V}')[x] \subseteq \mathcal{V}(x)\),

(c) for each \(0 \in \tau\) and \(y \in 0\), \(O_{y,3} \cap N(\mathcal{V}')[x] \neq \emptyset \Rightarrow x \in 0\) or \(y \in \mathcal{V}(x)\).

**Proof.** Part (a). \(y \in N(\mathcal{V}')[x] = \mathcal{V}'(x)\) implies that \(N(\mathcal{V})[y] = \mathcal{V}'(y) \subseteq \mathcal{V}'(x) = N(\mathcal{V}')[x]\).

Part (b). Note that each \(N(\mathcal{V}')[x] \subseteq (N^3(\mathcal{V}))^3[x]\). So it suffices to show that \((N^3(\mathcal{V}))^3[x] \subseteq \mathcal{V}(x)\). Clearly \(N^3(\mathcal{V})[x] = (\mathcal{V}(x))_{x}^3 \subseteq \mathcal{V}(x)\). Therefore \(y \in N^3(\mathcal{V})[x] \Rightarrow y \in \mathcal{V}(x) \Rightarrow \mathcal{V}'(y) \subseteq \mathcal{V}(x) \Rightarrow N^3(\mathcal{V})[y] \subseteq \mathcal{V}(x) \subseteq \mathcal{V}(y) \in \mathcal{V}(x)\). Consequently, \((N^3(\mathcal{V}))^3[x] \subseteq \mathcal{V}(x)\). Similarly, \(z \in (N^3(\mathcal{V}))^2 \Rightarrow \mathcal{V}(z) \subseteq \mathcal{V}(x) \Rightarrow (N^3(\mathcal{V}))[z] \subseteq \mathcal{V}(z) \subseteq \mathcal{V}(x)\). Consequently, \((N^3(\mathcal{V}))^3[x] \subseteq \mathcal{V}(x)\), as desired.

Part (c). \(O_{y,3} \cap N(\mathcal{V}')[x] \neq \emptyset \Rightarrow O_{y,3} \cap (N^3(\mathcal{V}))^3[x] \neq \emptyset\). Thus there exists \(p, w \in X\) such that \(O_{y,3} \cap \mathcal{V}'(p)_{p} \neq \emptyset\), with \(p \in (\mathcal{V}(w))_w^3\), \(w \in (\mathcal{V}(x))_x^3\); hence, \(y \in (\mathcal{V}(p))_{p}^2\) or \(p \in O_{y,2}\). If \(y \in (\mathcal{V}(p))_{p}^2\) then \(y \in \mathcal{V}(p) \subseteq \mathcal{V}(w) \subseteq \mathcal{V}(x)\). If \(p \in O_{y,2}\) then \(O_{y,2} \cap (\mathcal{V}(w))_{w}^3 \neq \emptyset\); hence, \(y \in \mathcal{V}(w)_{w}^2 \subseteq \mathcal{V}(w) \subseteq \mathcal{V}(x)\) or \(w \in O_{y}\). But \(w \in O_{y}\) implies that \(O_{x} \cap (\mathcal{V}(x))_{x}^3 \neq \emptyset\) which implies that \(y \in (\mathcal{V}(x))_{x}^2 \subseteq \mathcal{V}(x)\) or \(x \in 0\). This completes the proof.
**Lemma 1.2.** To each \( x \in (X, \tau) \) one can assign a sequence \( \{h_n(x)\} \) of open neighborhoods of \( x \) such that

(i) \( h_0(x) \supset h_1(x) \supset \ldots \),
(ii) \( y \in h_n(x) \Rightarrow h_n(y) \subset h_n(x) \),
(iii) \( y \in U \in \tau \Rightarrow \) there exists \( n \) such that \( y \notin (\bigcup \{h_n(x) \mid x \notin U\})^- \),
(iv) For \( n > 0 \) and \( y \in U \in \tau \), \( U \cap h_n(x) \neq \emptyset \Rightarrow x \in U \) or \( y \in h_{n-1}(x) \).

**Proof.** From Lemma 4.2 and Theorem 4.17 of [3], we can find a sequence \( \mathcal{U}_0 \subset \mathcal{U}_1 \subset \mathcal{U}_2 \subset \ldots \) of point finite open covers of \( X \) which satisfy the following condition:

(*) For each \( y \in U \in \tau \), there exists \( n \) such that

\[ y \notin \left( \bigcup \{\mathcal{U}_n(x) \mid x \notin U\} \right)^- . \]

Let \( \mathcal{U}_0 = \mathcal{V}_1 \) and \( \mathcal{U}_n = (\mathcal{U}_{n-1} \cup \mathcal{V}_n)' \) for \( n = 1, 2, \ldots \) (Recall that \( N(\mathcal{U}_n) \subset (N^3(\mathcal{U}_{n-1} \cup \mathcal{V}_n))^3 \)). For each \( x \in X \) and \( n = 0, 1, 2, \ldots \), let \( h_n(x) = N(\mathcal{U}_n)[x] = \mathcal{U}_n(x) \). Let us check that the \( h_n(x) \) satisfy conditions (i)–(iv) above.

(i) \( h_n(x) = N(\mathcal{U}_n)[x] \subset (\mathcal{U}_{n-1} \cup \mathcal{V}_n)(x) \subset \mathcal{U}_{n-1}(x) = h_{n-1}(x) \), where the first containment follows from Lemma 1.1(b).

(ii) \( y \in h_n(x) \Rightarrow h_n(y) = \mathcal{U}_n(y) \subset \mathcal{U}_n(x) = h_n(x) \).

(iii) From (i) we get that \( h_n(x) \subset (\mathcal{U}_{n-1} \cup \mathcal{V}_n)(x) \subset \mathcal{V}_n(x) \). Since the \( \mathcal{V}_n(x) \) satisfy (*) then so do the \( h_n(x) \).

(iv) \( U \cap h_n(x) \neq \emptyset \Leftrightarrow U \cap N((\mathcal{U}_{n-1} \cup \mathcal{V}_n))[x] \neq \emptyset \Rightarrow x \in U \) or \( y \in (\mathcal{U}_{n-1} \cup \mathcal{V}_n)(x) \subset \mathcal{U}_{n-1}(x) = h_{n-1}(x) \). This completes the proof.

Let \( Q_0 \) denote the set of rational numbers in \([0, 1]\).

**Lemma 1.3.** To each \( U \in \tau \) and \( r \in Q_0 \), one can assign a closed \( U_r \subset X \) such that

(1) \( s < r \Rightarrow U_r \subset U_s^0 \),
(2) \( U = \bigcup \{U_r \mid r \in Q_0\} \),
(3) for each \( r \in Q_0 \), \( \{U_r \mid U \in \tau\} \) is closure-preserving.

**Proof.** Let \( \{0 = r_0, r_1, \ldots \} \) be an enumeration of the rationals in \([0, 1]\). Let \( U_0 = U \). Suppose \( U_n \) has been defined for \( k < n \). Define \( U_n \) as follows: Choose \( k(n) \leq n \) such that \( r_{k(n)} < r_n \) and \( r_{k(n)} = \max\{r_j \mid j < n \text{ and } r_j < r_n\} \). Let \( U_n = X - \bigcup \{h_n(x) \mid x \notin U_0^k\} \) and let us verify that the \( U_r \) satisfy all requirements.

(3) From Lemma 2.2(ii) we get that, for each \( n \), \( \{h_n(x) \mid x \in X\} \) is an interior-preserving open cover of \( X \). Therefore \( \{\bigcup_{x \in A} h_n(x) \mid A \subset X\} \) is
also interior-preserving or, equivalently, \( \{X - \bigcup_{x \in A} h_n(x) \mid A \subset X \} \) is closure-preserving. This shows that, for each \( r \), \( \{U_r \mid U \in \tau \} \) is closure-preserving.

(2) Let \( y \in U \in \tau \). From Lemma 1.2(iii), there exists \( n \) such that \( y \notin (\bigcup \{h_n(x) \mid x \notin U\})^- \). From Lemma 1.2(i),

\[
y \nabla \left( \bigcup \left\{ h_j(x) \mid x \notin U \right\} \right)^-, \n\]

for \( j \geq n \). Find \( r_m \) with \( m \geq n \) such that \( r_m < r_k \) for each \( 0 < k < m \) (if no such \( r_m \) exists, then \( r_m \geq \min\{r_1, \ldots, r_n\} \neq 0 \), for \( m \geq n \), a contradiction). Then \( y \in U_{r_m} = X - \bigcup \{h_m(x) \mid x \notin U\} \).

(1) Suppose \( r_m < r_n \) and let us show that \( U_{r_m} \subset U_{r_m}^0 \). We consider two cases.

**Case 1.** \( m < n \). Then

\[
U_{r_m} = X - \bigcup \{h_n(x) \mid x \notin U_{r_k(n)}^0 \} \subset X - \bigcup \{h_n(x) \mid x \notin U_{r_m}^0 \},
\]

because \( r_m \leq r_{k(n)} \). So \( y \notin U_{r_m}^0 \) implies that \( h_n(y) \cap U_{r_m} = \emptyset \) which implies that \( y \notin U_{r_m} \). Hence \( U_{r_m} \subset U_{r_m}^0 \).

**Case 2.** \( m > n \). By induction, let us assume that \( U_r \subset U_r^0 \) for \( r_k < r_j \) and \( k + j < m + n \). Let \( r_t = \min\{r_j \mid r_j > r_m \text{ and } j < m\} \). Then \( r_m < r_t \leq r_n \) and it suffices to show that \( U_{r_t} \subset U_{r_t}^0 \): Suppose not. Then there exists \( y \in U_{r_t} - U_{r_m}^0 \). Let \( k^0(m) = m \) and \( k^j(m) = k(k^{j-1}(m)) \) for \( j = 1, 2, \ldots \). We will prove that \( y \in U_{r_t} - U_{r_m}^0 \) implies the following:

(\ **) For each \( j \geq 0 \), \( k^j(m) > t \) and \( y \in h_{k^j(m)}(x_j) \) for some \( x_j \in U_{r_{k^j+l(m)}} - U_{r_{k^j+l(m)}}^0 \).

(Proof by induction.) Since \( y \in U_{r_t} \) and \( r_{k(m)} < r_t \), we get that \( y \in U_{r_{k(m)}}^0 \) (note that \( k(m) + t < m + n \); so \( U_{r_t} \subset U_{r_{k(m)}}^0 \)). Letting \( x_0 = y \) we get that (\ **) is valid for \( j = 0 \).

Suppose (\ **) is valid for \( j \leq i \) and let us show its validity for \( i + 1 \). Since

\[
x_i \in U_{r_{k^i+l(m)}}^0 - U_{r_{k^i+l(m)}}^0 \quad \text{and} \quad U_{r_{k^i+l(m)}}^0 = X - \left( \bigcup \left\{ h_{k^i(m)}(x) \mid x \notin U_{r_{k^i+l(m)}}^0 \right\} \right)^- \,
\]

then \((U_{r_k+l(m)})_x \cap h_k(m)(x_{i+1}) \neq \emptyset\), for some \(x_{i+1} \in U_{r_k+l(m)}^0\). Therefore, by Lemma 1.2(iv), \(x_i \in h_k(m)-1(x_{i+1}) \subset h_{k+1}(m)(x_{i+1})\) which implies that \(y \in h_k(m)(x_i) \subset h_{k+1}(m)(x_i) \subset h_k(m)(x_{i+1})\), because of Lemma 1.2(ii).

Also \(x_{i+1} \in U_{r_k+l(m)}^0\): Suppose not. Since

\[
U_{r_k+l(m)}^0 = X - \bigcup \{ h_{k+1}(m)(x) \mid x \notin U_{r_k+l(m)}^0 \},
\]

we get that \(h_{k+1}(m)(x_{i+1}) \cap U_{r_k+l(m)} = \emptyset\). So \(y \notin U_{r_k+l(m)}^0\) (because \(y \in h_{k+1}(m)(x_{i+1})\)) which contradicts \(y \in U_{r_k+l(m)}\) (note that \(k^1+1(m) + t < m + n\)).

Finally \(k^{i+1}(m) > t\): Suppose \(k^{i+1}(m) \leq t\). Then \(r_{k+1}(m) \leq r_{k(t)}\). Since \(x_{i+1} \notin U_{r_k+l(m)}^0\) then \(x_{i+1} \notin U_{r_k(t)}^0\) (again \(k^{i+1}(m) + k(t) < m + n\)). Since \(x_i \in h_k(m)-1(x_{i+1})\) and \(y \in h_k(m)(x_i)\), by Lemma 1.2 (ii; i), we get that \(y \notin U_{r_k+l(m)}\) (because \(k^i(m) > t\), by induction hypothesis). Since \(h_k(x_{i+1}) \cap U_{r_k} = \emptyset\) (because \(x_{i+1} \notin U_{r_k(t)}^0\)) and \(y \notin U_{r_k}\), we get a contradiction. This completes the proof of (**).

Since \(m > k(m) > k^2(m) > \cdots\), (** yields a contradiction (a strictly decreasing sequence of positive integers!). Consequently, \(U_{r_k} \subset U_{r_m}^0\), which completes the proof.

3. Proof of main result. That (b) ⇒ (c) is clear. To get (c) ⇒ (a), we prove that any space satisfying (c) has a σ-cushioned pair-base. To this end, let \(\{(q_n, r_n) : n \in \omega\}\) enumerate all pairs \((q, r)\) of rationals in \([0, 1]\) such that \(q < r\). Let \(\mathcal{U}_{n,m} = \{f^{-1}([r_n, 1]), f^{-1}([q_n, 1]) : f \in \overline{\mathcal{F}}_m\}\), where \(\mathcal{F} = \bigcup_{m \in \omega} \mathcal{F}_m\) satisfies (c). Then \(\mathcal{U} = \bigcup_{n,m \in \omega} \mathcal{U}_{n,m}\) is easily seen to be a pair-base. To see that \(\mathcal{U}_{n,m}\) is cushioned, first note that any subset of \(\mathcal{U}_{n,m}\) has the form

\[
\{ f^{-1}([r_n, 1]), f^{-1}([q_n, 1]) : f \in \overline{\mathcal{F}}_m' \} \quad \text{where} \quad \overline{\mathcal{F}}_m' \subset \overline{\mathcal{F}}_m.
\]

Then

\[
\bigcup_{f \in \overline{\mathcal{F}}_m} f^{-1}([r_n, 1]) \subset (\sup \overline{\mathcal{F}}_m')^{-1}([r_n, 1])
\]

\[
\subset (\sup \overline{\mathcal{F}}_m')^{-1}[r_n, 1] \subset \bigcup_{f \in \overline{\mathcal{F}}_m} f^{-1}([q_n, 1]).
\]

It remains to prove (a) ⇒ (b). By Lemma 2.3, for each \(U \in \tau\), define \(f_U : X \to I\) by

\[
f_U(x) = \begin{cases} 1, & \text{if } x \in U, \\ \inf \{ r \in D \mid x \notin U_r \}, & \text{otherwise.} \end{cases}
\]
Clearly \( f_U^{-1}(0) = X - U \). Also each \( f_U \) is continuous (note that
\[ \left( f_U^{-1}([t, 1]) \right) = \cap \left\{ U_s \mid s < t, s \in D \right\} \) and \( f_U^{-1}(\{t, 1\}) = \cup \left\{ U_s \mid s > t, s \in D \right\} = \cup \left\{ U_s^0 \mid s > t, s \in D \right\} \) for each \( t \in D \), and \( \{t, 1\} \mid t \in D \} \cup \{[0, t[ \mid t \in D \} \) is a subbasis for \( I \).

Now let \( \mathcal{U} \subset \tau \) and let us show that \( \sup_{U \in \mathcal{U}} f_U \) is continuous: First, note that, for each \( r \in D \),
\[ \left( \sup_{U \in \mathcal{U}} f_U \right)^{-1}([r, 1]) = \bigcup_{U \in \mathcal{U}} f_U^{-1}(r, 1]. \]

To complete the proof, we need to show that \( \left( \sup_{U \in \mathcal{U}} f_U \right)^{-1}([r, 1]) \) is closed. Suppose there exists
\[ p \in \left( \left( \sup_{U \in \mathcal{U}} f_U \right)^{-1}([r, 1]) \right)^c. \]
Then, for \( \delta < s < t < r, s, t \in D \),
\[ p \notin \bigcup_{U \in \mathcal{U}} f_U^{-1}([s, 1]) \cup \bigcup_{U \in \mathcal{U}} U_s = \left( \bigcup_{U \in \mathcal{U}} U_s \right)^c \supset \left( \bigcup_{U \in \mathcal{U}} f_U^{-1}([t, 1]) \right)^c, \]
by Lemma 1.3(3). So there exists a neighborhood \( 0 \) of \( p \) such that
\[ 0 \cap \left( \bigcup_{U \in \mathcal{U}} f_U^{-1}([t, 1]) \right) = \emptyset, \]
which implies that \( f_U(0) \subset [0, t[ \) for each \( U \in \mathcal{U} \); therefore, \( \left( \sup_{U \in \mathcal{U}} f_U \right)^{-1}([r, 1]) \cap 0 = \emptyset \), a contradiction.

From the proof of the "if part of Theorem 1 and Proposition 2 of [4], one easily glans the following result.

**Theorem 2.** A \( T_1 \)-space \( Y \) is paracompact if and only if, for each open cover \( \mathcal{V} \) of \( Y \), there exists a family \( \{ f_\alpha \mid f_\alpha : Y \rightarrow I \} \) of continuous functions such that

(i) \( \sup_{\alpha \in \Lambda} f_\alpha \) is continuous, for each \( \Gamma \subset \Lambda \),
(ii) \( \{ f_\alpha^{-1}(0, 1) \} \) refines \( \mathcal{V} \).
