MAXIMAL SUBALGEBRAS OF $C^*$-CROSSED PRODUCTS

COSTEL PELIGRAD AND S. RUBINSTEIN
MAXIMAL SUBALGEBRAS OF C*-CROSSED PRODUCTS

C. PELIGRAD AND S. RUBINSTEIN

Let \((A, G, \alpha)\) be a \(C^*\)-dynamical system. Suppose \(G\) is discrete, archimedean-linearly ordered, and \(A\) is simple with unit. In this paper we prove that the subalgebra of analytic elements \(A(G, \hat{\alpha}) \subseteq C^*(A, G, \alpha)\) is a maximal subalgebra of the crossed product \(C^*(A, G, \alpha)\).

The same question is solved for a \(C^*\)-dynamical system associated with a von Neumann algebra with a homogeneous periodic state. Finally, if \(G = \mathbb{Z}\) we prove the converse of this result.

1. Introduction. In [12] Wermer proved that the algebra of all continuous functions on the unit circle \(|z| = 1\) which can be extended to the unit disk \(|z| \leq 1\), so as to be analytic in the interior, is a maximal subalgebra of the Banach algebra \(C(\mathbb{T})\) of all continuous, complex-valued functions on the unit circle.

In [1] Arens and Singer presented a generalisation of part of the theory of analytic functions in the unit disc, established by observing the role played in the classical theory by the group of integers, then replacing this group by a locally compact abelian group \(G\) possessing a suitably distinguished semigroup \(G_+\).

Further, in [6] Hoffman and Singer extended to this context the maximality theorem of Wermer. In this paper we extend the same theorem to the context of \(C^*\)-crossed products. We mention that the analogous study for \(W^*\)-crossed products was successfully made in [8] for the case \(G = \mathbb{Z}\). In §4 we solve the same question for a \(C^*\)-dynamical system associated with a von Neumann algebra with a homogeneous periodic state.

2. Preliminaries and notations.

2A. Dynamical systems and spectra. Let \((A, G, \alpha)\) be a \(C^*\)-dynamical system with \(G\) abelian, i.e. a \(C^*\)-algebra and an abelian locally compact group \(G\) of \(*\)-automorphisms of \(A\) with the property that for each \(g \in G\), the function \(g \mapsto \alpha_g(a)\) is continuous.

We define a representation \(\alpha(\cdot)\) of \(L^1(G)\) into the bounded operators on \(A\) by \(\alpha(f)a = \int f(g)\alpha_g(a)\,dg\, (a \in A)\), where \(f \in L^1(G)\). For \(f \in L^1(G)\) we put \(Z(f) = \{p \in \hat{G} | \hat{f}(p) = 0\}\), where \(\hat{G}\) is the dual of \(G\) and \(\hat{f}\) is the Fourier transform of \(f\).
Let $\text{Sp} \alpha$ be defined as $\cap \{Z(f) | f \in L^1(G), \alpha(f) = 0\}$. If $a \in A$ let $\text{Sp}_a(a) = \cap \{Z(f) | f \in L^1(G), \alpha(f)a = 0\}$.

We refer the reader to [3] for the elementary properties of spectra and spectral subspaces.

Throughout this paper we suppose $G$ discrete and, hence, $\hat{G}$ compact. Suppose there exists a subsemigroup $G_+ \subset G$ with the following properties:

$$G_+ \cup (-G_+) = G,$$

$$G_+ \cap (-G_+) = \{0\}.$$ 

Let $(B, \hat{G}, \beta)$ be a $C^*$-dynamical system. Denote \(\mathcal{O}(G, \beta) = \{b \in B | \text{Sp}_\beta(b) \subset G_+\}\). By [3], \(\mathcal{O}(G, \beta)\) is a norm-closed non-selfadjoint subalgebra of $B$.

Now, for each $g \in G$, we consider the weak integration

$$\epsilon_g(b) = \int_{\hat{G}} \langle g, p \rangle \beta_p(b) \, dp,$$

where $dp$ is the normalised Haar measure on $b$. Then $\epsilon_g$ is a bounded linear mapping from $B$ onto $B_g = \{b \in B | \beta_p(b) = \langle g, p \rangle b, p \in \hat{G}\}$. We also have the following properties:

$$\epsilon_{g_1} \circ \epsilon_{g_2} = \delta_{g_1g_2} \epsilon_{g_1}, \quad g_1, g_2 \in G,$$

(here $\delta_{g_1g_2}$ is the Kronecker symbol)

$$\epsilon_g(a_1ba_2) = a_1\epsilon_g(b)a_2, \quad a_1, a_2 \in B_0, b \in B.$$

Clearly $B_0 = \mathcal{O}(G, \beta) \cap \mathcal{O}(G, \beta)^*$ is the algebra of all fixed points with respect to $\beta$, and $\epsilon_0$ is a faithful, $\beta$-invariant projection of norm one from $B$ onto $B_0$.

The following lemma is a slight generalisation of [9, Lemma 1].

2.1. LEMMA (i) For any $g_1, g_2, g_1 \cdot g_2 = g_1 + g_2$ and $B_0^* = B_{-g_1}$.
(ii) Let $b_1, b_2 \in B$. If $\epsilon_g(b_1) = \epsilon_g(b_2)$ for all $g \in G$ then $b_1 = b_2$.
(iii) For $b \in B$, we have $\text{Sp}_\beta(b) = \{g \in G | \epsilon_g(b) \neq 0\}$.
(iv) For $g \in G$, $B_g = \{b \in B | \text{Sp}_\beta(b) = \{g\}\}$.

The following lemma is well known and easy to prove:

2.2. LEMMA. $B$ is linearly spanned by $\bigcup_{g \in G} B_g$ in the norm topology.
2.3. Remark. If \( b \in B \) is such that \( \varepsilon_{g_0}(b) = 0 \) for some \( g_0 \in G \), then there exists a sequence \( b_n = \sum_g b^n(g) \), \( b^n(g) \in B_g \), which converges to \( b \) (in norm) such that \( b^n(g_0) = 0 \) for all \( n \). Indeed, by Lemma 2.2 there exists a sequence \( c_n = \sum_g c^n(g) \), \( c^n(g) \in B_g \), which converges to \( b \). Since \( \varepsilon(g_n) = c^n(g) \) (by Lemma 1.1(iii)) and \( \varepsilon_g \) is bounded for all \( g \in G \), we have that \( \varepsilon_{g_0}(c_n) \) converges to \( \varepsilon_{g_0}(b) = 0 \). Therefore \( b_n = c_n - \varepsilon_{g_0}(c_n) \) satisfies the desired property.

2B. \( C^* \)-crossed products. Let \( (A, G, \alpha) \) be a \( C^* \)-dynamical system with \( G \) discrete, abelian. Assume \( A \subset B(H) \) for some Hilbert space \( H \). Let \( \mathcal{P}(G, A) \) denote the set of “trigonometric polynomials”:

\[
\mathcal{P}(G, A) = \{ f : G \to A \mid f(g) = 0 \text{ for all but finitely many } g \in G \}.
\]

Define a faithful representation of \( \mathcal{P}(G, A) \) on \( l^2(G, H) \) by

\[
(\cdot \xi)(g) = \sum_{s \in G} \alpha_{-g}(\cdot(s))\xi(g - s), \quad \gamma \in \mathcal{P}(G, A), \xi \in l^2(G, H).
\]

We identify \( \mathcal{P}(G, A) \) with its image in \( B(l^2(G, H)) \) and denote by \( C^*(G, \alpha, A) \) the \( C^* \)-algebra generated by \( \mathcal{P}(G, A) \). It can be shown that \( C^*(G, \alpha, A) \) does not depend no the representation of \( A \) on \( H \). We say that \( C^*(G, \alpha, A) \) is the crossed product of \( G \) with \( A \).

The following element of \( \mathcal{P}(G, A) \):

\[
y(g) = 1, \quad y(s) = 0 \quad \text{for all } s \neq g
\]

will be denoted by \( \lambda_G \).

Also, the element \( y \in \mathcal{P}(G, A) \):

\[
y(0) = a \quad \text{for some } a \in A,
\]

\[
y(g) = 0 \quad \text{for all } g \neq 0,
\]

will be denoted by \( a \).

We denote by \( (C^*(G, \alpha, A), \hat{G}, \hat{\alpha}) \) the dual system of \( (A, G, \alpha) \) [10].

If \( G \) is ordered by a subsemigroup \( G_+ \) as in 2A, then we may apply the results of 2A to \( (C^*(G, \alpha, A), \hat{G}, \hat{\alpha}) \).

3. The main results. We say that a \( C^* \)-algebra \( A \) is simple if it has no nontrivial closed two-sided ideals. We say that \( A \) is \( G \)-simple if it has no nontrivial, closed, \( G \)-invariant two-sided ideals. If \( G \) is ordered by the subsemigroup \( G_+ \), we say that \( G \) is archimedean ordered if for any \( g_1, g_2 \in G_+ \setminus \{0\} \) there exists \( n \in \mathbb{N} \) such that \( ng_1 > g_2 \). Then it is well known that \( G \) is isomorphic with a subgroup of \( \mathbb{R} \).
Let $B$ be a $C^*$-algebra with unit. We say that a closed subalgebra $\mathcal{A} \subset B$ with the unit of $B$ is a Dirichlet subalgebra if $\mathcal{A} + \mathcal{A}^*$ is norm dense in $B$. Let $\varepsilon$ be a faithful projection of norm one in $B$. A Dirichlet subalgebra $\mathcal{A} \subset B$ is said to be $C^*$-subdiagonal if the pair $(\mathcal{A}, \varepsilon)$ satisfies the following conditions:

(i) $\varepsilon$ is multiplicative on $\mathcal{A}$.

(ii) $\varepsilon(\mathcal{A}) = \mathcal{A} \cap \mathcal{A}^*$.

We call the $C^*$-subalgebra $\mathcal{A} \cap \mathcal{A}^*$ the diagonal of $\mathcal{A}$. Then using [7, Theorem 3.1], the proof of [7, Theorem 2.4] can be adapted to prove:

3.1. THEOREM. Let $A$ be a $C^*$-algebra with unit, and $G$ a discrete, commutative group of automorphisms of $A$.

Suppose $G$ is archimedean-linearly ordered. The $\mathcal{R}(G, \hat{\alpha})$ is a maximal $C^*$-subdiagonal subalgebra of $C^*(G, \alpha, A)$ with respect to the projection $\varepsilon_0$ (§1).

The following theorem gives a sufficient condition for $\mathcal{R}(G, \hat{\alpha})$ to be a maximal subalgebra of $C^*(G, \alpha, A)$.

3.2. THEOREM. Let $A$ be a simple $C^*$-algebra with unit and $G$ an automorphism group of $A$. Suppose $G$ is discrete and archimedean-linearly ordered. Then $\mathcal{R}(G, \hat{\alpha})$ is a maximal subalgebra of $C^*(G, \alpha, A)$.

Proof. The proof is inspired from Cohen's proof in the classical case ([5]). Let $\mathcal{R} \subset C^*(G, \alpha, A)$ be a subalgebra which contains $\mathcal{R}(G, \hat{\alpha})$. Then there exist $b \in \mathcal{R}$ and $t_0 \in G_+ \setminus \{0\}$ such that $\varepsilon_{-t_0}(b) \neq 0$. It is easy to see that the set $J = \{a \in A \mid (\exists) b \in \mathcal{R}, \lambda_{t_0} \varepsilon_{-t_0}(b) = a\}$ is a non-zero two-sided ideal in $A$. Since $A$ is simple, it follows that $J = A$. Therefore, there exists $b_0 \in \mathcal{R}$ such that $\lambda_{t_0} \varepsilon_{-t_0}(b_0) = 1$.

By definition of the crossed product and Remark 2.3, there exist two "trigonometric polynomials" $p, q \in \mathcal{R}(G, \hat{\alpha})$ and $h \in C^*(G, \alpha, A)$ such that

$$\lambda_{t_0} b_0 = 1 + \lambda_{t_1} p + \lambda_{-t_2} q^* + h, \quad ||h|| < \frac{1}{2},$$

for some $t_1, t_2 \in G_+ \setminus \{0\}$.

Let $s_0 \in G_+$ be $s_0 = \min\{t_0, t_1, t_2\}$. We also set $b_1 = \lambda_{t_0-s_0} b_0 \in \mathcal{R}$, $p_1 = \lambda_{t_1-s_0} p \in \mathcal{R}(G, \hat{\alpha})$, and $q_1 = q \lambda_{t_2-s_0} \in \mathcal{R}(G, \hat{\alpha})$. Then

$$\lambda_{s_0} b_1 = 1 + \lambda_{s_0} p_1 + \lambda_{-s_0} q_1^* + h, \quad ||h|| < \frac{1}{2}.$$
Let \( M = \|q_1 \lambda_{s_0} - \lambda_{-s_0} q_1^* \|. \) Since \( q_1 \lambda_{s_0} - \lambda_{-s_0} q_1^* = i \cdot h, \) where \( h \) is selfadjoint, we have, for every \( \delta > 0, \)
\[
\|1 + \delta(q_1 \lambda_{s_0} - \lambda_{-s_0} q_1^*)\| \leq 1 + \delta^2 M^2.
\]
Further, we have
\[
\delta \cdot \lambda_{-s_0} q_1^* = \delta(\lambda_{s_0} b_1 - 1 - \lambda_{s_0} p_1) - \delta h \\
= \lambda_{s_0}(\delta b_1 - p_1) - \delta h - \delta \\
= \lambda_{s_0} g - \delta h - \delta,
\]
where \( g = \delta b_1 - p_1 \in \mathcal{B}. \)

Let \( q_1' \in \mathcal{B}(G, \alpha) \) be such that \( q_1 \lambda_{s_0} = \lambda_{s_0} q_1'. \) From (1), (2) and the fact that \( \|h\| < \frac{1}{2}, \) it follows that
\[
\|1 + \delta + \lambda_{s_0}(-g + \delta q_1')\| \leq 1 + \delta^2 \cdot M^2 + \delta/2.
\]
If \( \delta < 1/2 M^2, \) then from (3) we obtain
\[
\|1 + \delta + \lambda_{s_0}(-g + \delta q_1')\| < 1 + \delta.
\]

Since, obviously, \( \lambda_{s_0}(-g + \delta q_1') \in \mathcal{B}, \) from (4) it follows that this element has an inverse \( k \) in \( \mathcal{B}. \) So \( \lambda_{s_0} (g + \delta q_1')k = 1. \) From this it follows that \( \lambda_{-s_0} = (g + \delta q_1')k \in \mathcal{B}. \)

Let \( s \in G_+ \) be arbitrary. Since \( G \) is archimedean ordered, there exists \( n \in \mathbb{N} \) such that \( ns_0 > s. \) Then
\[
\lambda_{-s} = \lambda_{ns_0-s} \cdot \lambda_{-s_0} \in \mathcal{B}.
\]
It follows that \( \mathcal{B} = C^*(G, \alpha, A). \)

In what follows we discuss some partial converses of the preceding theorem.

3.3. **Proposition.** Let \( A \) be a unital \( C^* \)-algebra, and \( \alpha \) a \(*\)-automorphism of \( A. \) If \( \mathcal{B}(\mathbb{Z}, \hat{\alpha}) \) is a maximal subalgebra of \( C^*(\mathbb{Z}, \alpha, A), \) then \( A \) is simple.

**Proof.** Suppose \( A \) is not simple and let \( J \subset A \) be a non-trivial two-sided ideal. We show that \( \mathcal{B}(\mathbb{Z}, \hat{\alpha}) \) is not maximal by producing a subspace \( \mathfrak{M} \subset C^*(\mathbb{Z}, \alpha, A) \) with the following properties:

(i) \( b \mathfrak{M} \subset \mathfrak{M} \) for every \( b \in \mathcal{B}(\mathbb{Z}, \hat{\alpha}). \)

(ii) There exists \( g \in C^*(\mathbb{Z}, \alpha, A) \setminus \mathcal{B}(\mathbb{Z}, \hat{\alpha}) \) such that \( g \mathfrak{M} \subset \mathfrak{M}. \)

(iii) \( \mathfrak{M} \) is not a left ideal of \( C^*(\mathbb{Z}, \alpha, A). \)
Let \( \mathcal{M} \) be the closure of the set of polynomials \( b: \mathbb{Z} \to A \) with the property that \( b(n) \in \alpha^n(J) \) for all \( n < 0 \).

Let \( p \in \mathbb{N} \) and \( f \in \mathcal{M} \) a polynomial. Then \( (\lambda_p \cdot f)(n) = \alpha_p f(n - p) \). Hence, if \( n < 0 \) we have \( (\lambda_p f)(n) \in \alpha^n(J) \). Also, if \( a \in A \), we have \( (a \cdot f)(n) = a \cdot f(n) \in \alpha^n(J) \). Hence \( b\mathcal{M} \subseteq \mathcal{M} \) for all \( b \in \mathcal{A}(\mathbb{Z}, \alpha) \) and \( (i) \) is proved.

To prove \( (ii) \) let \( x \in \alpha^{-1}(J) \). Then the element \( x \cdot \lambda_{-1} \) satisfies \( (ii) \). Obviously \( \lambda_{-1} \mathcal{M} \not\subseteq \mathcal{M} \), whence \( (iii) \).

Therefore \( \mathcal{A}(\mathbb{Z}, \alpha) \) is not maximal. It follows that \( A \) is simple.

3.4. PROPOSITION. Let \( A \) be a unital C*-algebra and \( G \) a discrete, commutative, linearly ordered group of \* -automorphisms of \( A \). If \( \mathcal{A}(G, \alpha) \) is a maximal subalgebra of \( C^*(G, \alpha, A) \), then:

(i) The order on \( G \) is archimedean.

(ii) \( A \) is \( G \)-simple.

Proof. Suppose the order on \( G \) is not archimedean. Then there exist \( t_1, t_2 \in G_+ \setminus \{0\} \) such that \( nt_1 < t_2 \) for every \( n \in \mathbb{N} \). Then the algebra \( \mathfrak{B} \) generated by \( \mathcal{A}(G, \alpha) \) and \( \lambda_{-t_1} \) satisfies \( \mathcal{A}(G, \alpha) \subseteq \mathfrak{B} \subseteq C^*(G, \alpha, A) \). Hence \( \mathcal{A}(G, \alpha) \) is not maximal, and \( (i) \) is proved.

Now we show that \( A \) is \( G \)-simple. Suppose \( A \) is not \( G \)-simple. Then there exists a non-trivial \( G \)-invariant two-sided ideal \( J \subset A \). Set \( \mathfrak{B} = \{ b \in C^*(G, \alpha, A) | \epsilon_t(b) \in J, \ t < 0 \} \). Then \( \mathfrak{B} \) is an algebra and \( \mathcal{A}(G, \alpha) \not\subseteq \mathfrak{B} \subseteq C^*(G, \alpha, A) \). Therefore \( A \) is \( G \)-simple.

3.5. PROPOSITION. Let \( A \) be a unital C*-algebra and \( G \) a discrete, commutative, linearly ordered group of \* -automorphisms of \( A \). Suppose:

(i) \( A \) is primitive and postliminar.

(ii) \( \mathcal{A}(G, \alpha) \) is a maximal subalgebra of \( C^*(G, \alpha, A) \).

Then we have:

(iii) \( G \) is archimedean ordered.

(iv) \( A \) is a finite-dimensional factor.

Proof. \( (iii) \) follows from Proposition 3.4. Let us prove \( (iv) \). Let \( \hat{\mathcal{A}} \) be the space of irreducible representations of \( \hat{A} \) and \( \text{Prim}(A) \) the space of primitive ideals of \( A \) with the Jacobson topology. Then by [4, Théorème 4.3.7] the mapping \( \pi \mapsto \ker \pi \) is a bijection between \( \hat{\mathcal{A}} \) and \( \text{Prim}(A) \). By [4, Théorème 4.4.5] there exists a maximal open set \( U \subset \text{Prim}(A) \) which is separated. Since \( A \) is primitive, it follows that \( (0) \in \text{Prim}(A) \). Obviously,
(0) is dense in Prim(A). Therefore, (0) ∈ U. Since every open set \( V \subseteq \) Prim(A) contains (0), it follows that (0) = U. Therefore \( C(0) = \{ J \in \) Prim(A) \( \mid J \neq (0) \} \) is closed in Prim(A). Thus \( \cap C(0) = J_0 \neq 0 \). Now it is easy to see that \( J_0 \) is \( G \)-invariant. Since by Proposition 3.4, \( A \) is \( G \)-simple, it follows that \( J_0 = (0) \). This contradiction shows that \( A \) is simple. Since \( A \) is unital, primitive and postliminar, it follows that \( A \) is a finite-dimensional factor.

4. Subalgebras of a von Neumann algebra with a homogeneous periodic state. Let \( M \) be a von Neumann algebra. Suppose \( M \) has a homogeneous periodic state \( \varphi \) in the sense that \( G(\varphi) = \{ \sigma \in \text{Aut}(M) \mid \varphi \circ \sigma = \varphi \} \) acts ergodically on \( M \) and the modular automorphism group \( \sigma_t^\varphi \) of \( M \) associated with \( \varphi \) is a periodic flow. A penetrating study of such algebras was made by Takesaki [11]. Let \( T > 0 \) be the period of \( \sigma_t^\varphi \). Put \( \rho = e^{-2\pi/T} \), \( 0 < \rho < 1 \). Set \( M_n = \{ x \in M \mid \sigma_t^\varphi(x) = \rho^{int}x \} \), \( n \in \mathbb{Z} \). For each \( n \in \mathbb{Z} \), we consider the integration

\[ \varepsilon_n(x) = \frac{1}{T} \int_0^T \rho^{-int} \sigma_t^\varphi(x) \, dt, \quad x \in M. \]

Then

\[ \varepsilon_n(M) = M_n, \quad n \in \mathbb{Z}, \]

\[ \varepsilon_n \circ \varepsilon_m = \delta_{nm} \varepsilon_n, \quad m, n \in \mathbb{Z}, \]

\[ \varepsilon_n(axb) = a \varepsilon_n(x)b, \quad a, b \in M_0, x \in M. \]

\[ M_nM_m = M_{n+m}, \quad n, m \in \mathbb{Z}. \]

\[ M_n^* = M_{-n}, \quad n \in \mathbb{Z}. \]

We collect some results from [11] in the following

4.1. Theorem. (i) The subspace \( M_1 \) of \( M \) contains an isometry \( u \) such that for \( n \geq 1 \), \( M_n = M_0u^n \) and \( M_{-n} = u^*M_0 \).

(ii) In the pre-Hilbert space structure induced by the state \( \varphi \), \( M \) is decomposed into an orthogonal direct sum as follows:

\[ M = \cdots \oplus u^*M_0 \oplus \cdots \oplus u^*M_0 \oplus M_0 \oplus M_0u \oplus \cdots \oplus M_0u^n \oplus \cdots. \]

(iii) \( M_0 \) is of type \( \text{II}_1 \).

(iv) \( M \) is of type \( \text{III} \).

Let \( B \) denote the \( C^* \)-subalgebra of \( M \) generated by \( M_0 \) and \( u \). Obviously \( B \) is \( \sigma_t^\varphi \)-invariant, \( t \in \mathbb{R} \).
Moreover since the mapping \( t \mapsto \sigma^y_t(x) \) is norm-continuous for every \( x \in M_n \), \( n \in \mathbb{Z} \), it follows that it is norm-continuous for every \( x \in B \). Therefore, we can consider the \( C^* \)-dynamical system \((B, \sigma^y, R)\). By Lemma 2.1 and Theorem 4.1(i) it follows that \( \text{Sp}(\sigma^y) \) is isomorphic with \( \mathbb{Z} \).

As in §2 let \( \mathcal{A}(Z, \sigma^y) \) denote the algebra of all elements of \( B \) with non-negative spectrum.

4.2. Proposition. \( \mathcal{A}(Z, \sigma^y) \) is a maximal subalgebra of \( B \) if and only if \( M_0 \) is a factor.

Proof. Suppose \( M_0 \) is a factor. We follow the proof of Theorem 3.2. Let \( \mathfrak{B} \subset B \) be such that \( \mathcal{A}(Z, \sigma^y) \subset \mathfrak{B} \). Then there exist \( b_0 \in \mathfrak{B} \) and \( n \in \mathbb{N} \) such that \( \varepsilon_{-n}(b_0) \neq 0 \). We may assume \( n = 1 \). Let \( K = \{ x \in M_0 | (\exists) b \in \mathfrak{B}, \varepsilon_{-1}(b) = u^*x \} \). \( K \) is a linear subspace of \( M_0 \). If we put \( e = uu^* \), it can be easily shown that the mapping \( \text{Ad}(u)(x) = uxu^* \) is an isomorphism of \( M_0 \) onto \( eM_0e \).

We claim that \( eKe \) is a two-sided ideal of \( eM_0e \). Indeed, if \( b \in \mathfrak{B} \) is such that \( \varepsilon_{-1}(b) = x \in eKe \) and \( a \in eM_0e \), then

\[
(u^*au)u^*x = u^*a \in x = u^* \in a \in x = u^*ax.
\]

Therefore, since \( u^*au \in M_0 \subset \mathcal{A}(Z, \sigma^y) \subset \mathfrak{B} \), we have

\[
\varepsilon_{-1}(u^*au \cdot b) = u^*ax, \quad \text{so} \quad ax \in eKe.
\]

Similarly

\[
\varepsilon_{-1}(ba) = u^*xa, \quad \text{so} \quad xa \in eKe.
\]

Since \( M_0 \) is a finite factor it follows that \( eM_0e \) is a finite factor. Therefore \( eM_0e \) is simple. Hence \( eKe = eM_0e \). Then there exists \( b_0 \in \mathfrak{B} \) such that \( \varepsilon_{-1}(b_0) = u^*e = u^* \).

By definition of \( B \), there exist two "polynomials" \( p, q \in \mathcal{A}(Z, \sigma^y) \) and \( h \in B \) such that

\[
b_0u = 1 + pu + u^*q^* + h, \quad \|h\| < 1/2.
\]

The rest of the proof of the "if" part is the same as that of Theorem 3.2. Now suppose \( \mathcal{A}(Z, \sigma^y) \) is maximal in \( B \).

If \( M_0 \) is not a factor, let \( \tilde{\theta} \) be the automorphisms of the center \( Z_0 \) of \( M_0 \) defined as follows:

\[
uzu^* = \tilde{\theta}(z)e \quad \text{(see [11, Lemma 1.20])}.
\]

There are the following possibilities:

I. \( \tilde{\theta} \) is not ergodic.
In this case there exists a projection \( q \in Z_0 \) such that \( \tilde{\theta}(q) = q \). Then \( q \) belongs to the center \( Z \) of \( M \). Therefore, the algebra \( B \) generated by \( \mathfrak{B}(Z, \sigma^\phi) \) and \( qB \) is such that \( \mathfrak{B}(Z, \sigma^\phi) \subset B \subset \mathfrak{B} \), a contradiction. Hence \( M_0 \) is a factor.

II. \( \tilde{\theta} \) is ergodic.

In this case there exists \( q \in Z_0 \) such that \( q\tilde{\theta}(q) = 0 \). Then it can easily be verified that the algebra \( B \) generated by \( \mathfrak{B}(Z, \sigma^\phi) \) and the set \( \{ U^*\tilde{\theta}(q)y \mid y \in M_0 \} \) is such that \( \mathfrak{B}(Z, \sigma^\phi) \subset B \subset \mathfrak{B} \). This contradiction shows that \( M_0 \) is a factor.

Mathematical papers intended for publication in the Pacific Journal of Mathematics should be in typed form or offset-reproduced (not dittoed), double spaced with large margins. Please do not use built up fractions in the text of the manuscript. However, you may use them in the displayed equations. Underline Greek letters in red, German in green, and script in blue. The first paragraph must be capable of being used separately as a synopsis of the entire paper. In particular it should contain no bibliographic references. Please propose a heading for the odd numbered pages of less than 35 characters. Manuscripts, in triplicate, may be sent to any one of the editors. Please classify according to the scheme of Math. Reviews, Index to Vol. 39. Supply name and address of author to whom proofs should be sent. All other communications should be addressed to the managing editor, or Elaine Barth, University of California, Los Angeles, California 90024.

There are page-charges associated with articles appearing in the Pacific Journal of Mathematics. These charges are expected to be paid by the author's University, Government Agency or Company. If the author or authors do not have access to such Institutional support these charges are waived. Single authors will receive 50 free reprints; joint authors will receive a total of 100 free reprints. Additional copies may be obtained at cost in multiples of 50.

The Pacific Journal of Mathematics is issued monthly as of January 1966. Regular subscription rate: $132.00 a year (6 Vol., 12 issues). Special rate: $66.00 a year to individual members of supporting institutions.

Subscriptions, orders for numbers issued in the last three calendar years, and changes of address should be sent to Pacific Journal of Mathematics, P.O. Box 969, Carmel Valley, CA 93924, U.S.A. Old back numbers obtainable from Kraus Periodicals Co., Route 100, Millwood, NY 10546.

The Pacific Journal of Mathematics ISSN 0030-8730 is published monthly by the Pacific Journal of Mathematics at P.O. Box 969, Carmel Valley, CA 93924. Application to mail at Second-class postage rates is pending at Carmel Valley, California, and additional mailing offices. Postmaster: Send address changes to Pacific Journal of Mathematics, P.O. Box 969, Carmel Valley, CA 93924.
