# WEYL TRANSFORMS ASSOCIATED WITH A SINGULAR SECOND-ORDER DIFFERENTIAL OPERATOR

CYRINE BACCAR AND LAKHDAR TANNECH RACHDI

**For a class of singular second-order differential operators  $\Delta$ , we define and study the Weyl transforms  $W_\sigma$  associated with  $\Delta$ , where  $\sigma$  is a symbol in  $S^m$ , for  $m \in \mathbb{R}$ . We give criteria in terms of  $\sigma$  for boundedness and compactness of the transform  $W_\sigma$ .**

## Introduction

Herman Weyl [1931] studied extensively the properties of pseudodifferential operators arising in quantum mechanics, regarding them as bounded linear operators on  $L^2(\mathbb{R}^n)$ , the space of square-integrable functions on  $\mathbb{R}^n$  with respect to Lebesgue measure). M. W. Wong calls these operators, which are the subject of his book [Wong 1998], Weyl transforms.

Here we consider the second-order differential operator defined on  $]0, +\infty[$  by

$$\Delta u = u'' + \frac{A'}{A}u' + \rho^2 u,$$

where  $A$  is a nonnegative function satisfying certain conditions and  $\rho$  is a nonnegative real number.

This operator plays an important role in analysis. For example, many special functions (orthogonal polynomials) are eigenfunctions of an operator of  $\Delta$  type. The radial part of the Beltrami–Laplacian in a symmetric space is also of  $\Delta$  type. Many aspects of such operators have been studied; we mention, in chronological order, [Chebli 1979; Trimèche 1981; Zeuner 1989; Xu 1994; Trimèche 1997; Nessibi et al. 1998]. In particular, the first two of these references investigate standard constructions of harmonic analysis, such as translation operators, convolution product, and Fourier transform, in connection with  $\Delta$ .

Building on these results, we define and study the Weyl transforms associated with  $\Delta$ , giving criteria for boundedness and compactness of these transforms. To obtain these results we first define the Fourier–Wigner transform associated with  $\Delta$ , and establish an inversion formula.

---

*MSC2000:* 42A38, 65R10.

*Keywords:* Weyl transform, compact operator, Fourier–Wigner transform.

More precisely, in [Section 1](#) we recall some properties of harmonic analysis for the operator  $\Delta$ . In [Section 2](#) we define the Fourier–Wigner transform associated with  $\Delta$ , study some of its properties, and prove an inversion formula.

In [Section 3](#) we introduce the Weyl transform  $W_\sigma$  associated with  $\Delta$ , with  $\sigma$  a symbol in class  $S^m$ , for  $m \in \mathbb{R}$ , and we give its connection with the Fourier–Wigner transform. We prove that, for  $\sigma$  sufficiently smooth,  $W_\sigma$  is a compact operator from  $L^2(d\nu)$  (the space of square-integrable functions with respect to the measure  $d\nu(x) = A(x) dx$ ) into itself.

In [Section 4](#) we define  $W_\sigma$  for  $\sigma$  in a certain space  $L^p(d\nu \otimes d\gamma)$ , with  $p \in [1, 2]$ , and we establish that  $W_\sigma$  is again a compact operator.

In [Section 5](#) we define  $W_\sigma$  for  $\sigma$  in another function space, and use this to prove in [Section 6](#) that for  $p > 2$  there exists a function  $\sigma$  in the  $L^p$  space corresponding to that of [Section 4](#), with the property that the Weyl transform  $W_\sigma$  is not bounded on  $L^2(d\nu)$ .

## 1. The operator $\Delta$

We consider the second-order differential operator  $\Delta$  defined on  $]0, +\infty[$  by

$$\Delta u = u'' + \frac{A'}{A}u' + \rho^2 u,$$

where  $\rho$  is a nonnegative real number and

$$(1-1) \quad A(x) = x^{2\alpha+1} B(x), \quad \alpha > -\frac{1}{2},$$

for  $B$  a positive, even, infinitely differentiable function on  $\mathbb{R}$  such that  $B(0) = 1$ . Moreover we assume that  $A$  and  $B$  satisfy the following conditions:

- (i)  $A$  is increasing and  $\lim_{x \rightarrow +\infty} A(x) = +\infty$ .
- (ii)  $\frac{A'}{A}$  is decreasing and  $\lim_{x \rightarrow +\infty} \frac{A'(x)}{A(x)} = 2\rho$ .
- (iii) There exists a constant  $\delta > 0$  such that

$$\begin{aligned} \frac{B'(x)}{B(x)} &= D(x) \exp(-\delta x) \quad \text{if } \rho = 0, \\ \frac{A'(x)}{A(x)} &= 2\rho + D(x) \exp(-\delta x) \quad \text{if } \rho > 0, \end{aligned}$$

where  $D$  is an infinitely differentiable function on  $]0, +\infty[$ , bounded and with bounded derivatives on all intervals  $[x_0, +\infty[$ , for  $x_0 > 0$ .

This operator was studied in [[Chebli 1979](#); [Nessibi et al. 1998](#); [Trimèche 1981](#)], and the following results have been established:

(I) For all  $\lambda \in \mathbb{C}$ , the equation

$$(1-2) \quad \begin{cases} \Delta u = -\lambda^2 u \\ u(0) = 1, \quad u'(0) = 0 \end{cases}$$

admits a unique solution, denoted by  $\varphi_\lambda$ , with the following properties:

- $\varphi_\lambda$  satisfies the *product formula*

$$(1-3) \quad \varphi_\lambda(x)\varphi_\lambda(y) = \int_0^\infty \varphi_\lambda(z) w(x, y, z) A(z) dz \quad \text{for } x, y \geq 0;$$

where  $w(x, y, \cdot)$  is a measurable positive function on  $[0, +\infty[$ , with support in  $[|x-y|, x+y]$ , satisfying

$$\begin{aligned} \int_0^\infty w(x, y, z) A(z) dz &= 1, \\ w(x, y, z) &= w(y, x, z) \quad \text{for } z \geq 0, \\ w(x, y, z) &= w(x, z, y) \quad \text{for } z > 0; \end{aligned}$$

- for  $x \geq 0$ , the function  $\lambda \mapsto \varphi_\lambda(x)$  is analytic on  $\mathbb{C}$ ;
- for  $\lambda \in \mathbb{C}$ , the function  $x \mapsto \varphi_\lambda(x)$  is even and infinitely differentiable on  $\mathbb{R}$ ;
- $|\varphi_\lambda(x)| \leq 1$  for all  $\lambda \in \mathbb{R}$  and  $x \in \mathbb{R}$ ;
- for  $x > 0$ , and  $\lambda > 0$  we have

$$(1-4) \quad \varphi_\lambda(x) = \frac{1}{\sqrt{B(x)}} j_\alpha(\lambda x) + A^{-1/2}(x) \theta_\lambda(x),$$

where  $j_\alpha$  is defined by  $j_\alpha(0) = 1$  and  $j_\alpha(s) = 2^\alpha \Gamma(\alpha + 1) s^{-\alpha} J_\alpha(s)$  if  $s \neq 0$  (with  $J_\alpha$  the Bessel function of first kind), and the function  $\theta_\lambda$  satisfies

$$|\theta_\lambda(x)| \leq \frac{c_1}{\lambda^{\alpha+\frac{3}{2}}} \left( \int_0^x |Q(s)| ds \right) \exp \left( \frac{c_2}{\lambda} \int_0^x |Q(s)| ds \right)$$

with  $c_1, c_2$  positive constants and  $Q$  the function defined on  $]0, +\infty[$  by

$$(1-5) \quad Q(x) = \frac{\frac{1}{4} - \alpha^2}{x^2} + \frac{1}{4} \left( \frac{A'(x)}{A(x)} \right)^2 + \frac{1}{2} \left( \frac{A'(x)}{A(x)} \right)' - \rho^2.$$

(II) For nonzero  $\lambda \in \mathbb{C}$ , the equation  $\Delta u = -\lambda^2 u$  has a solution  $\Phi_\lambda$  satisfying

$$\Phi_\lambda(x) = A^{-1/2}(x) \exp(i\lambda x) V(x, \lambda),$$

with  $\lim_{x \rightarrow +\infty} V(x, \lambda) = 1$ . Consequently there exists a function (spectral function)

$$\lambda \mapsto c(\lambda),$$

such that

$$\varphi_\lambda = c(\lambda)\Phi_\lambda + c(-\lambda)\Phi_{-\lambda} \quad \text{for nonzero } \lambda \in \mathbb{C}.$$

Moreover there exist positive constants  $k_1, k_2, k_3$  such that

$$(1-6) \quad k_1 |\lambda|^{\alpha+1/2} \leq |c(\lambda)|^{-1} \leq k_2 |\lambda|^{\alpha+1/2}$$

for all  $\lambda$  such that  $\text{Im } \lambda \leq 0$  and  $|\lambda| \geq k_3$ .

**Notation.** We denote by

- $d\nu(x)$  the measure defined on  $[0, +\infty[$  by

$$d\nu(x) = A(x) dx;$$

- $L^p(d\nu)$ , for  $1 \leq p \leq +\infty$ , the space of measurable functions on  $[0, +\infty[$  satisfying

$$\|f\|_{p,\nu} := \left( \int_0^{+\infty} |f(x)|^p d\nu(x) \right)^{1/p} < +\infty \quad \text{for } 1 \leq p < +\infty,$$

$$\|f\|_{\infty,\nu} := \text{ess sup}_{x \in [0, +\infty[} |f(x)| < +\infty;$$

- $d\gamma(\lambda)$  the measure defined on  $[0, +\infty[$  by

$$d\gamma(\lambda) = \frac{d\lambda}{2\pi |c(\lambda)|^2};$$

- $L^p(d\gamma)$ , for  $1 \leq p \leq +\infty$ , the space of measurable functions on  $[0, +\infty[$  satisfying  $\|f\|_{p,\gamma} < +\infty$ ;
- $D_*(\mathbb{R})$  the space of even, infinitely differentiable functions on  $\mathbb{R}$ , with compact support;
- $\mathbb{H}_*(\mathbb{C})$  the space of even analytic functions on  $\mathbb{C}$ , rapidly decreasing of exponential type.

**Definition 1.1.** The *translation operator* associated with  $\Delta$  is defined on  $L^1(d\nu)$  by

$$\mathcal{T}_x f(y) = \int_0^{+\infty} f(z)w(x, y, z) d\nu(z) \quad \text{for } x, y \geq 0,$$

where  $w$  is defined in (1-3). The *convolution product* associated with  $\Delta$  is defined by

$$(f * g)(x) = \int_0^{+\infty} \mathcal{T}_x f(y)g(y) d\nu(y) \quad \text{for } f, g \in L^1(d\nu).$$

**Properties of translation and convolution.**

- The translation operator satisfies

$$\mathcal{T}_x \varphi_\lambda(y) = \varphi_\lambda(x) \varphi_\lambda(y).$$

- Let  $f \in L^1(d\nu)$ . Then

$$\int_0^{+\infty} \mathcal{T}_x f(y) d\nu(y) = \int_0^{+\infty} f(y) d\nu(y) \quad \text{for } x \in [0, +\infty[$$

and

$$\|\mathcal{T}_x f\|_{1,\nu} \leq \|f\|_{1,\nu}.$$

- Let  $f \in L^p(d\nu)$  with  $1 \leq p \leq +\infty$ . For all  $x \in [0, +\infty[$ , the function  $\mathcal{T}_x f$  belongs to  $L^p(d\nu)$  and

$$\|\mathcal{T}_x f\|_{p,\nu} \leq \|f\|_{p,\nu}.$$

- For  $f, g \in L^1(d\nu)$  the function  $f * g$  also lies in  $L^1(d\nu)$ . The convolution product is commutative and associative.
- For  $f \in L^1(d\nu)$  and  $g \in L^p(d\nu)$ , with  $1 \leq p < +\infty$ , the function  $f * g$  lies in  $L^p(d\nu)$  and we have

$$\|f * g\|_{p,\nu} \leq \|f\|_{1,\nu} \|g\|_{p,\nu}.$$

- For  $f, g$  even and continuous on  $\mathbb{R}$ , with supports

$$\text{supp } f \subset [-a, a] \quad \text{and} \quad \text{supp } g \subset [-b, b],$$

the function  $f * g$  is continuous on  $\mathbb{R}$  and

$$(1-7) \quad \text{supp}(f * g) \subset [-a-b, a+b].$$

**Definition 1.2.** The *Fourier transform* associated with the operator  $\Delta$  is defined on  $L^1(d\nu)$  by

$$\mathcal{F}f(\lambda) = \int_0^{+\infty} f(x) \varphi_\lambda(x) d\nu(x) \quad \text{for } \lambda \in \mathbb{R}.$$

**Properties of the Fourier transform.**

- For  $f \in L^1(d\nu)$  such that  $\mathcal{F}f \in L^1(d\gamma)$ , we have the inversion formula

$$(1-8) \quad f(x) = \int_0^{+\infty} \mathcal{F}f(\lambda) \varphi_\lambda(x) d\gamma(\lambda) \quad \text{for a.e. } x \in [0, +\infty[.$$

- For  $f \in L^1(d\nu)$ ,

$$\mathcal{F}(\mathcal{T}_x f)(\lambda) = \varphi_\lambda(x) \mathcal{F}f(\lambda) \quad \text{for all } x \in [0, +\infty[ \text{ and } \lambda \in \mathbb{R}.$$

- For  $f, g \in L^1(d\nu)$ ,

$$\mathcal{F}(f * g)(\lambda) = \mathcal{F}f(\lambda) \mathcal{F}g(\lambda). \quad \text{for all } \lambda \in [0, +\infty[.$$

- $\mathcal{F}$  can be extended to an isometric isomorphism from  $L^2(d\nu)$  onto  $L^2(d\gamma)$ .  
This means that

$$(1-9) \quad \|\mathcal{F}f\|_{2,\gamma} = \|f\|_{2,\nu} \quad \text{for } f \in L^2(d\nu),$$

$$(1-10) \quad \|\mathcal{F}^{-1}f\|_{2,\nu} = \|f\|_{2,\gamma} \quad \text{for } f \in L^2(d\gamma).$$

**Proposition 1.3.** *Let  $f$  be in  $L^p(d\nu)$ , with  $p \in [1, 2]$ . Then  $\mathcal{F}f$  belongs to  $L^{p'}(d\gamma)$ , with  $1/p + 1/p' = 1$ , and*

$$(1-11) \quad \|\mathcal{F}f\|_{p',\gamma} \leq \|f\|_{p,\nu}.$$

*Proof.* Since  $|\varphi_\lambda(x)| \leq 1$  for  $\lambda \in \mathbb{R}$  and  $x \in \mathbb{R}$ , we get  $\|\mathcal{F}f\|_{\infty,\gamma} \leq \|f\|_{1,\nu}$ . This, together with (1-9) and the Riesz–Thorin Theorem [Stein 1956; Stein and Weiss 1971], shows that for under the conditions of the proposition  $\mathcal{F}f$  belongs to  $L^{p'}(d\gamma)$  and satisfies (1-11).  $\square$

From [Chebli 1979], the Fourier transform  $\mathcal{F}$  is a topological isomorphism from  $D_*(\mathbb{R})$  onto  $\mathbb{H}_*(\mathbb{C})$  (see page 204 for notation). The inverse mapping is given by

$$(1-12) \quad \mathcal{F}^{-1}f(x) = \int_0^{+\infty} f(\lambda) \varphi_\lambda(x) d\gamma(\lambda) \quad \text{for } x \in \mathbb{R}.$$

## 2. Fourier–Wigner transform associated with $\Delta$

**Definition 2.1.** The Fourier–Wigner transform associated with the operator  $\Delta$  is the mapping  $V$  defined on  $D_*(\mathbb{R}) \times D_*(\mathbb{R})$  by

$$V(f, g)(x, \lambda) = \int_0^{+\infty} f(y) \mathcal{T}_x g(y) \varphi_\lambda(y) d\nu(y) \quad \text{for } (x, \lambda) \in \mathbb{R} \times \mathbb{R}.$$

**Remark.** The transform  $V$  can also be written in the forms

$$(2-1) \quad V(f, g)(x, \lambda) = \mathcal{F}(f \mathcal{T}_x g)(\lambda) = \varphi_\lambda f * g(x).$$

**Notation.** We denote by

- $D_*(\mathbb{R}^2)$  the space of infinitely differentiable functions on  $\mathbb{R}^2$ , even with respect to each variable, with compact support;
- $S_*(\mathbb{R}^2)$  the space of infinitely differentiable functions on  $\mathbb{R}^2$ , even with respect to each variable, rapidly decreasing together with all their derivatives;

- $L^p(d\nu \otimes d\nu)$ , for  $1 \leq p \leq +\infty$ , the space of measurable functions on the product  $[0, +\infty[ \times [0, +\infty[$  satisfying

$$\|f\|_{p, \nu \otimes \nu} := \left( \int_0^{+\infty} \int_0^{+\infty} |f(x, y)|^p d\nu(x) d\nu(y) \right)^{1/p} < +\infty \quad \text{for } 1 \leq p < +\infty,$$

$$\|f\|_{\infty, \nu \otimes \nu} := \operatorname{ess\,sup}_{x, y \in [0, +\infty[} |f(x, y)| < +\infty;$$

- $L^p(d\nu \otimes d\gamma)$ , for  $1 \leq p \leq +\infty$ , the space similarly defined (with  $d\nu(x) d\gamma(y)$  in the integrand).

**Proposition 2.2.** (i) *The Fourier–Wigner transform  $V$  is a bilinear mapping from  $D_*(\mathbb{R}) \times D_*(\mathbb{R})$  into  $S_*(\mathbb{R}^2)$ .*

(ii) *For  $p \in ]1, 2]$  and  $p'$  such that  $1/p + 1/p' = 1$ , we have*

$$\|V(f, g)\|_{p', \nu \otimes \gamma} \leq \|f\|_{p, \nu} \|g\|_{p', \nu}.$$

*The transform  $V$  can be extended to a continuous bilinear operator, denoted also by  $V$ , from  $L^p(d\nu) \times L^{p'}(d\nu)$  into  $L^{p'}(d\nu \otimes d\gamma)$ .*

*Proof.* (i) Let  $F$  be the function defined on  $\mathbb{R}^2$  by  $F(x, y) = f(y) \mathcal{T}_x g(y)$ . It's clear that  $F \in D_*(\mathbb{R}^2)$ , and we have

$$V(f, g)(x, \lambda) = I \otimes \mathcal{F}(F)(x, \lambda),$$

where  $I$  is the identity operator. This and the fact that  $\mathcal{F}$  is a topological isomorphism from  $D_*(\mathbb{R})$  onto  $\mathbb{H}_*(\mathbb{C})$  imply (i).

(ii) This follows from the first equality in (2–1) together with [Proposition 1.3](#), Minkowski's inequality for integrals [[Folland 1984](#), p.186], and the fact that

$$\|\mathcal{T}_x g\|_{p', \nu} \leq \|g\|_{p', \nu} \quad \text{for } x \in \mathbb{R}. \quad \square$$

**Theorem 2.3.** *For  $f, g \in D_*(\mathbb{R})$ , we have*

$$\mathcal{F} \otimes \mathcal{F}^{-1} (V(f, g)) (\mu, \lambda) = \varphi_\mu(\lambda) f(\lambda) \mathcal{F}g(\mu) \quad \text{for } \mu, \lambda \in \mathbb{R}.$$

*Proof.* Using [Definition 2.1](#) and Fubini's Theorem we have, for all  $\mu, \lambda \in \mathbb{R}$ ,

$$\begin{aligned} \mathcal{F} \otimes \mathcal{F}^{-1} (V(f, g)) (\mu, \lambda) &= \int_0^{+\infty} \int_0^{+\infty} V(f, g)(x, y) \varphi_\mu(x) \varphi_y(\lambda) d\nu(x) d\gamma(y) \\ &= \int_0^{+\infty} \int_0^{+\infty} \mathcal{F}(f \mathcal{T}_x g)(y) \varphi_\mu(x) \varphi_y(\lambda) d\nu(x) d\gamma(y) \\ &= \int_0^{+\infty} \varphi_\mu(x) \left( \int_0^{+\infty} \mathcal{F}(f \mathcal{T}_x g)(y) \varphi_y(\lambda) d\gamma(y) \right) d\nu(x). \end{aligned}$$

From (1–8) we deduce

$$\begin{aligned}\mathcal{F} \otimes \mathcal{F}^{-1} (V(f, g)) (\mu, \lambda) &= \int_0^{+\infty} \varphi_\mu(x) f(\lambda) \mathcal{T}_x g(\lambda) dv(x) \\ &= f(\lambda) \mathcal{F}(\mathcal{T}_\lambda g)(\mu) = f(\lambda) \varphi_\mu(\lambda) \mathcal{F}g(\mu).\end{aligned}\quad \square$$

**Corollary 2.4.** *For all  $f, g \in D_*(\mathbb{R})$ , we have*

$$\begin{aligned}\int_0^{+\infty} \mathcal{F} \otimes \mathcal{F}^{-1} (V(f, g)) (\mu, \lambda) dv(\lambda) &= \mathcal{F}f(\mu) \mathcal{F}g(\mu) \quad \text{for } \mu \in \mathbb{R}, \\ \int_0^{+\infty} \mathcal{F} \otimes \mathcal{F}^{-1} (V(f, g)) (\mu, \lambda) d\gamma(\mu) &= f(\lambda) g(\lambda) \quad \text{for } \lambda \in \mathbb{R}.\end{aligned}$$

*Proof.* **Theorem 2.3** gives

$$\begin{aligned}\int_0^{+\infty} \mathcal{F} \otimes \mathcal{F}^{-1} (V(f, g)) (\mu, \lambda) dv(\lambda) &= \int_0^{+\infty} \varphi_\mu(\lambda) f(\lambda) \mathcal{F}g(\mu) dv(\lambda) \\ &= \mathcal{F}f(\mu) \mathcal{F}g(\mu) \quad \text{for } \mu \in \mathbb{R}, \\ \int_0^{+\infty} \mathcal{F} \otimes \mathcal{F}^{-1} (V(f, g)) (\mu, \lambda) d\gamma(\mu) &= \int_0^{+\infty} \varphi_\mu(\lambda) f(\lambda) \mathcal{F}g(\mu) d\gamma(\mu) \\ &= f(\lambda) \int_0^{+\infty} \varphi_\mu(\lambda) \mathcal{F}g(\mu) d\gamma(\mu) \\ &= f(\lambda) g(\lambda) \quad \text{for } \lambda \in \mathbb{R}.\end{aligned}\quad \square$$

**Theorem 2.5.** *Let  $f, g \in L^1(dv) \cap L^2(dv)$  be such that  $c = \int_0^{+\infty} g(x) dv(x) \neq 0$ . Then*

$$\mathcal{F}f(\lambda) = \frac{1}{c} \int_0^{+\infty} V(f, g)(x, \lambda) dv(x) \quad \text{for } \lambda \in \mathbb{R}.$$

*Proof.* From **Definition 2.1**, we have

$$\int_0^{+\infty} V(f, g)(x, \lambda) dv(x) = \int_0^{+\infty} \left( \int_0^{+\infty} f(y) \mathcal{T}_x g(y) \varphi_\lambda(y) dv(y) \right) dv(x)$$

for all  $\lambda \in \mathbb{R}$ . The result follows from Fubini's Theorem and the equality

$$\int_0^{+\infty} \mathcal{T}_x g(y) dv(y) = \int_0^{+\infty} g(x) dv(x) = c.\quad \square$$

**Corollary 2.6.** *With the hypothesis of **Theorem 2.5**, if  $\mathcal{F}f \in L^1(d\gamma)$ , we have the following inversion formula for the Fourier–Wigner transform  $V$ :*

$$f(x) = \frac{1}{c} \int_0^{+\infty} \varphi_\mu(x) \left( \int_0^{+\infty} V(f, g)(y, \mu) dv(y) \right) d\gamma(\mu) \quad \text{for a.e. } x \in \mathbb{R}.$$

### 3. The Weyl transform associated with $\Delta$

We now introduce the Weyl transform and relate it to the Fourier–Wigner transform. To do this, we must define the class of pseudodifferential operators [Wong 1998].

**Definition 3.1.** Let  $m \in \mathbb{R}$ . We define  $S^m$  to be the set of all infinitely differentiable functions  $\sigma$  on  $\mathbb{R} \times \mathbb{R}$ , even with respect to each variable, and such that for all  $p, q \in \mathbb{N}$ , there exists a positive constant  $C_{p,q,m}$  satisfying

$$\left| \left( \frac{\partial}{\partial x} \right)^p \left( \frac{\partial}{\partial y} \right)^q \sigma(x, y) \right| \leq C_{p,q,m} (1 + y^2)^{m-q}.$$

**Definition 3.2.** For  $m \in \mathbb{R}$  and  $\sigma \in S^m$ , we define the operator  $H_\sigma$  on  $D_*(\mathbb{R}) \times D_*(\mathbb{R})$  by

$$(3-1) \quad H_\sigma(f, g)(\lambda) = \int_0^{+\infty} \left( \int_0^{+\infty} \sigma(x, y) \varphi_y(\lambda) V(f, g)(x, y) dv(x) \right) d\gamma(y),$$

for all  $\lambda \in \mathbb{R}$ , and we put

$$(3-2) \quad \mathbb{H}_\sigma(f, g) = H_\sigma(f, g)(0).$$

**Proposition 3.3.** Define  $\sigma \in S^m$  by  $\sigma(x, y) = -y^2$  for  $x, y \in \mathbb{R}$ . Then, for all  $f, g \in D_*(\mathbb{R})$ , we have

$$H_\sigma(f, g)(\lambda) = c \Delta f(\lambda) \quad \text{for } \lambda \in \mathbb{R},$$

where  $c = \int_0^{+\infty} g(x) dv(x)$ .

*Proof.* From (3-1), we have

$$H_\sigma(f, g)(\lambda) = \int_0^{+\infty} \left( \int_0^{+\infty} -y^2 \varphi_y(\lambda) V(f, g)(x, y) dv(x) \right) d\gamma(y) \text{ for } \lambda \in \mathbb{R}.$$

Using Definition 2.1 we obtain

$$H_\sigma(f, g)(\lambda) = \int_0^{+\infty} \left( \int_0^{+\infty} -y^2 \varphi_y(\lambda) \left( \int_0^{+\infty} f(z) \mathcal{T}_x g(z) \varphi_y(z) dv(z) \right) dv(x) \right) d\gamma(y)$$

for  $\lambda \in \mathbb{R}$ . From Fubini's Theorem, we get

$$\begin{aligned} H_\sigma(f, g)(\lambda) &= \int_0^{+\infty} -y^2 \varphi_y(\lambda) \left( \int_0^{+\infty} f(z) \varphi_y(z) \left( \int_0^{+\infty} \mathcal{T}_z g(x) dv(x) \right) dv(z) \right) d\gamma(y) \\ &= c \int_0^{+\infty} -y^2 \varphi_y(\lambda) \left( \int_0^{+\infty} f(z) \varphi_y(z) dv(z) \right) d\gamma(y) \\ &= c \int_0^{+\infty} -y^2 \varphi_y(\lambda) \mathcal{F}f(y) d\gamma(y). \end{aligned}$$

But, for all  $y \in \mathbb{R}$ ,  $-y^2 \mathcal{F}f(y) = \mathcal{F}(\Delta f)(y)$ . We complete the proof using the inversion formula (1-8).  $\square$

**Definition 3.4.** Let  $\sigma \in S^m$ ;  $m < -\alpha - 1$ . The Weyl transform associated with  $\Delta$  is the mapping  $W_\sigma$  defined on  $D_*(\mathbb{R})$  by

$$W_\sigma(f)(\lambda) = \int_0^{+\infty} \left( \int_0^{+\infty} \varphi_y(\lambda) \sigma(x, y) \mathcal{T}_\lambda f(x) dv(x) \right) d\gamma(y) \quad \text{for } \lambda \in \mathbb{R}.$$

*Notation.* We denote by

- $S_*(\mathbb{R})$  the space of even, infinitely differentiable functions on  $\mathbb{R}$ , rapidly decreasing together with all their derivatives.
- $S_*^2(\mathbb{R}) = \varphi_0 S_*(\mathbb{R})$ , where  $\varphi_0$  is the solution of (1-2) with  $\lambda = 0$ .

For  $\rho = 0$  these two spaces coincide [Trimèche 1997]. The Fourier transform  $\mathcal{F}$  is a topological isomorphism from  $S_*^2(\mathbb{R})$  onto  $S_*(\mathbb{R})$ , whose inverse is given by (1-12).

**Lemma 3.5.** For  $\sigma \in D_*(\mathbb{R}^2)$ , the function  $k$  defined by

$$k(x, y) = \int_0^{+\infty} \varphi_\lambda(x) \mathcal{T}_x(\sigma(\cdot, \lambda))(y) d\gamma(\lambda) \quad \text{for } x, y \in \mathbb{R}$$

belongs to  $L^p(dv \otimes dv)$ , for all  $p \in [2, +\infty[$ .

*Proof.* The defining equation of  $k$  can be rewritten  $k(x, y) = \mathcal{T}_x(G(\cdot, x))(y)$ , where

$$G(x, y) = I \otimes \mathcal{F}^{-1}(\sigma)(x, y) \quad \text{for } x, y \in \mathbb{R},$$

for  $I$  the identity operator. It follows that, for all  $p \in [2, +\infty[$ ,

$$\begin{aligned} \int_0^{+\infty} \int_0^{+\infty} |k(x, y)|^p dv(x) dv(y) &= \int_0^{+\infty} \left( \int_0^{+\infty} |\mathcal{T}_x(G(\cdot, x)(y))|^p dv(y) \right) dv(x) \\ &\leq \int_0^{+\infty} \left( \int_0^{+\infty} |G(y, x)|^p dv(y) \right) dv(x) \\ &\leq \int_0^{+\infty} \left( \int_0^{+\infty} |I \otimes \mathcal{F}^{-1}(\sigma)(y, x)|^p dv(y) \right) dv(x). \end{aligned}$$

We distinguish two cases,  $p = 2$  and  $p \in ]2, +\infty[$ , the case  $p = +\infty$  being trivial.

For  $p = 2$ ,

$$\int_0^{+\infty} \int_0^{+\infty} |k(x, y)|^2 dv(x) dv(y) \leq \int_0^{+\infty} \left( \int_0^{+\infty} |\mathcal{F}^{-1}(\sigma(x, \cdot)(y))|^2 dv(x) \right) dv(y).$$

From (1-10) we deduce that

$$\int_0^{+\infty} \int_0^{+\infty} |k(x, y)|^2 dv(x) dv(y) \leq \int_0^{+\infty} \left( \int_0^{+\infty} |\sigma(y, x)|^2 d\gamma(y) \right) dv(y) < +\infty,$$

because  $\sigma$  belongs to  $D_*(\mathbb{R}^2)$ . The case  $p \in ]2, +\infty[$  is more complex. From the hypotheses on  $\Delta$ , we deduce that, as  $x \rightarrow +\infty$ ,

$$(3-3) \quad A(x) \sim \begin{cases} x^{2\alpha+1} & \text{if } \rho = 0, \\ \exp(2\rho x) & \text{if } \rho > 0. \end{cases}$$

- For  $\rho = 0$ , recall that  $\mathcal{F}$  is an isomorphism from  $S_*(\mathbb{R})$  onto itself. Thus  $I \otimes \mathcal{F}^{-1}(\sigma)$  belongs to  $S_*(\mathbb{R}^2)$ , and the asymptotics (3-3) implies

$$(3-4) \quad \int_0^{+\infty} \int_0^{+\infty} |k(x, y)|^p dv(x) dv(y) \\ \leq \int_0^{+\infty} \left( \int_0^{+\infty} |I \otimes \mathcal{F}^{-1}(\sigma)(y, x)|^p dv(x) \right) dv(y) < +\infty.$$

- For  $\rho > 0$ , we have from [Trimèche 1997, p. 99]

$$|\varphi_\lambda(x)| \leq \varphi_0(x) \leq m(1+x) \exp(-\rho x) \quad \text{for all } \lambda \in \mathbb{R} \text{ and } x \geq 0,$$

where  $m$  is a positive constant. Then

$$|I \otimes \mathcal{F}^{-1}(\sigma)(y, x)| \leq m(1+x) \exp(-\rho x) \int_0^{+\infty} |\sigma(y, z)| dv(z).$$

Since  $\sigma$  belongs to  $D_*(\mathbb{R}^2)$ , there exists a positive constant  $M$  such that

$$\int_0^{+\infty} |\sigma(y, z)| dv(z) \leq M \quad \text{for } y \geq 0,$$

which implies that

$$|I \otimes \mathcal{F}^{-1}(\sigma)(y, x)| \leq mM(1+x) \exp(-\rho x).$$

This, together with the asymptotics (3-3), implies the validity of the same bound (3-4) as in the previous case.  $\square$

**Theorem 3.6.** *Let  $\sigma \in D_*(\mathbb{R}^2)$  and  $f \in D_*(\mathbb{R})$ .*

- (i)  $W_\sigma(f)(x) = \int_0^{+\infty} k(x, y) f(y) dv(y)$  for all  $x \in \mathbb{R}$ .
- (ii)  $\|W_\sigma(f)\|_{p',v} \leq \|k\|_{p',v \otimes v} \|f\|_{p,v}$  for  $p \in [1, 2]$  and  $p'$  such that  $1/p + 1/p' = 1$ .
- (iii)  $W_\sigma$  can be extended to a bounded operator from  $L^p(dv)$  into  $L^{p'}(dv)$ . In particular,  $W_\sigma : L^2(dv) \rightarrow L^2(dv)$  is a Hilbert–Schmidt operator, hence compact.

*Proof.* (i) From [Definition 3.4](#), we have, for all  $x \in \mathbb{R}$ ;

$$\begin{aligned} W_\sigma(f)(x) &= \int_0^{+\infty} \varphi_y(x) \left( \int_0^{+\infty} \sigma(z, y) \mathcal{T}_x f(z) \, d\nu(z) \right) d\gamma(y) \\ &= \int_0^{+\infty} \varphi_y(x) \left( \int_0^{+\infty} f(z) \mathcal{T}_x[\sigma(\cdot, y)](z) \, d\nu(z) \right) d\gamma(y) \end{aligned}$$

From Fubini’s Theorem, we get, for all  $x \in \mathbb{R}$ ,

$$\begin{aligned} W_\sigma(f)(x) &= \int_0^{+\infty} f(z) \left( \int_0^{+\infty} \varphi_y(x) \mathcal{T}_x[\sigma(\cdot, y)](z) \, d\gamma(y) \right) d\nu(z) \\ &= \int_0^{+\infty} f(z) k(x, z) \, d\nu(z). \end{aligned}$$

(ii) Follows from (i), Hölder’s inequality, and [Lemma 3.5](#).

(iii) Since  $k \in L^2(d\nu \otimes d\nu)$ , the mapping

$$W_\sigma : L^2(d\nu) \longrightarrow L^2(d\nu)$$

is a Hilbert–Schmidt operator, and so compact. □

**Theorem 3.7.** *Let  $m < -\alpha - 1$  and  $\sigma \in S^m$ . For all  $f, g \in D_*(\mathbb{R})$ ,*

$$(3-5) \quad \mathbb{H}_\sigma(f, g) = \int_0^{+\infty} f(x) W_\sigma g(x) \, d\nu(x).$$

*Proof.* Using [\(3-2\)](#) and [Definition 2.1](#) we obtain

$$\begin{aligned} \mathbb{H}_\sigma(f, g) &= \int_0^{+\infty} \left( \int_0^{+\infty} \sigma(x, y) V(f, g)(x, y) \, d\nu(x) \right) d\gamma(y) \\ &= \int_0^{+\infty} \left( \int_0^{+\infty} \sigma(x, y) \left( \int_0^{+\infty} f(\lambda) \mathcal{T}_x g(\lambda) \varphi_y(\lambda) \, d\nu(\lambda) \right) d\nu(x) \right) d\gamma(y). \end{aligned}$$

From Fubini’s theorem, we get

$$\begin{aligned} \mathbb{H}_\sigma(f, g) &= \int_0^{+\infty} f(\lambda) \left( \int_0^{+\infty} \varphi_y(\lambda) \left( \int_0^{+\infty} \sigma(x, y) \mathcal{T}_x g(\lambda) \, d\nu(x) \right) d\gamma(y) \right) d\nu(\lambda) \\ &= \int_0^{+\infty} f(\lambda) W_\sigma(g)(\lambda) \, d\nu(\lambda). \end{aligned} \quad \square$$

#### 4. The Weyl transform with symbol in $L^p(d\nu \otimes d\gamma)$ , for $1 \leq p \leq 2$

In this section we show using [\(3-5\)](#) that, if  $1 \leq p \leq 2$ , the Weyl transform with symbol in  $L^p(d\nu \otimes d\gamma)$  is a compact operator.

**Notation.** We denote by  $\mathfrak{B}(L^2(d\nu))$  the  $\mathbb{C}^*$ -algebra of bounded operators  $\Psi$  from  $L^2(d\nu)$  into itself, equipped with the norm

$$\|\Psi\|_* = \sup_{\|f\|_{2,\nu}=1} \|\Psi(f)\|_{2,\nu}.$$

**Theorem 4.1.** Let  $\langle \cdot / \cdot \rangle$  denote the inner product in  $L^2(d\nu)$ . There exists a unique operator  $Q : L^2(d\nu \otimes d\gamma) \rightarrow \mathfrak{B}(L^2(d\nu))$ , whose action we denote by  $\sigma \mapsto Q_\sigma$ , such that

$$\langle Q_\sigma(g)/\bar{f} \rangle = \int_0^{+\infty} \left( \int_0^{+\infty} \sigma(x, y) V(f, g)(x, y) d\nu(x) \right) d\gamma(y) \quad \text{for } f, g \in L^2(d\nu).$$

Furthermore,  $\|Q_\sigma\|_* \leq \|\sigma\|_{2,\nu \otimes \gamma}$ .

*Proof.* Let  $\sigma \in D_*(\mathbb{R}^2)$ . For  $g \in D_*(\mathbb{R})$ , put  $Q_\sigma(g) = W_\sigma(g)$ . From Theorems 3.6 and 3.7, we obtain

$$\begin{aligned} \langle Q_\sigma(g)/\bar{f} \rangle &= \langle W_\sigma(g)/\bar{f} \rangle = \mathbb{H}_\sigma(f, g) \\ &= \int_0^{+\infty} \left( \int_0^{+\infty} \sigma(x, y) V(f, g)(x, y) d\nu(x) \right) d\gamma(y). \end{aligned}$$

On the other hand, from Proposition 2.2(ii), we have

$$|\langle Q_\sigma(g)/\bar{f} \rangle| \leq \|\sigma\|_{2,\nu \otimes \gamma} \|f\|_{2,\nu} \|g\|_{2,\nu}.$$

Thus  $Q_\sigma \in \mathfrak{B}(L^2(d\nu))$  and

$$(4-1) \quad \|Q_\sigma\|_* \leq \|\sigma\|_{2,\nu \otimes \gamma}.$$

Now consider  $\sigma \in L^2(d\nu \otimes d\gamma)$ . Let  $(\sigma_k)_{k \in \mathbb{N}}$  be a sequence in  $D_*(\mathbb{R}^2)$  such that  $\|\sigma_k - \sigma\|_{2,\nu \otimes \gamma}$  approaches 0 as  $k \rightarrow +\infty$ . From (4-1) we have, for all  $k, l \in \mathbb{N}$ ,

$$\|Q_{\sigma_k} - Q_{\sigma_l}\|_* \leq \|\sigma_k - \sigma_l\|_{2,\nu \otimes \gamma} \leq \|\sigma_k - \sigma\|_{2,\nu \otimes \gamma} + \|\sigma_l - \sigma\|_{2,\nu \otimes \gamma}.$$

Thus  $(Q_{\sigma_k})_{k \in \mathbb{N}}$  is a Cauchy sequence in  $\mathfrak{B}(L^2(d\nu))$ . Let it converge to  $Q_\sigma$ . Clearly  $Q_\sigma$  is independent from the choice of  $(\sigma_k)_{k \in \mathbb{N}}$ , and we have

$$\|Q_\sigma\|_* = \lim_{k \rightarrow +\infty} \|Q_{\sigma_k}\|_* \leq \lim_{k \rightarrow +\infty} \|\sigma_k\|_{2,\nu \otimes \gamma} = \|\sigma\|_{2,\nu \otimes \gamma}.$$

We consider first  $f, g \in D_*(\mathbb{R})$ . Then

$$\begin{aligned} \langle Q_\sigma(g)/\bar{f} \rangle &= \lim_{k \rightarrow +\infty} \langle Q_{\sigma_k}(g)/\bar{f} \rangle \\ &= \lim_{k \rightarrow +\infty} \int_0^{+\infty} \left( \int_0^{+\infty} \sigma_k(x, y) V(f, g)(x, y) d\nu(x) \right) d\gamma(y) \\ &= \int_0^{+\infty} \left( \int_0^{+\infty} \sigma(x, y) V(f, g)(x, y) d\nu(x) \right) d\gamma(y). \end{aligned}$$

Now let  $f, g$  be in  $L^2(d\nu)$ . Pick sequences  $(f_k)_{k \in \mathbb{N}}$ , and  $(g_k)_{k \in \mathbb{N}}$  in  $D_*(\mathbb{R})$  converging to  $f$  and  $g$ , respectively, in the  $\|\cdot\|_{2,\nu}$ -norm. Then

$$\begin{aligned} \langle Q_\sigma(g)/\bar{f} \rangle &= \lim_{k \rightarrow +\infty} \langle Q_\sigma(g_k)/\bar{f}_k \rangle \\ &= \lim_{k \rightarrow +\infty} \int_0^{+\infty} \left( \int_0^{+\infty} \sigma(x, y) V(f_k, g_k)(x, y) d\nu(x) \right) d\gamma(y) \\ &= \int_0^{+\infty} \left( \int_0^{+\infty} \sigma(x, y) V(f, g)(x, y) d\nu(x) \right) d\gamma(y). \quad \square \end{aligned}$$

We now give an extension of [Theorem 4.1](#) that will allow us to prove that for  $1 \leq p \leq 2$  the Weyl transform with symbol in  $L^p(d\nu \otimes d\gamma)$ , is a compact operator.

**Theorem 4.2.** *Let  $p \in [1, 2]$ . There exists a unique bounded operator*

$$Q : L^p(d\nu \otimes d\gamma) \rightarrow \mathfrak{B}(L^2(d\nu)),$$

whose action is denoted by  $\sigma \rightarrow Q_\sigma$ , such that

$$\langle Q_\sigma(g)/\bar{f} \rangle = \int_0^{+\infty} \left( \int_0^{+\infty} \sigma(x, y) V(f, g)(x, y) d\nu(x) \right) d\gamma(y) \quad \text{for } f, g \in D_*(\mathbb{R}).$$

Moreover,  $\|Q_\sigma\|_* \leq \|\sigma\|_{p,\nu \otimes \gamma}$ .

*Proof.* The case  $p = 2$  is given by [Theorem 4.1](#). We turn to the case  $p = 1$ . For  $\sigma \in D_*(\mathbb{R}^2)$ , we define  $Q_\sigma$  by

$$Q_\sigma(g) = W_\sigma(g) \quad \text{for } g \in D_*(\mathbb{R}).$$

From [Theorems 3.6](#) and [3.7](#), we have, for  $f \in D_*(\mathbb{R})$ ,

$$\langle Q_\sigma(g)/\bar{f} \rangle = \mathbb{H}_\sigma(f, g) = \int_0^{+\infty} \left( \int_0^{+\infty} \sigma(x, y) V(f, g)(x, y) d\nu(x) \right) d\gamma(y).$$

From Hölder’s inequality we then obtain

$$|\langle Q_\sigma(g)/\bar{f} \rangle| \leq \|\sigma\|_{1,\nu \otimes \gamma} \|V(f, g)\|_{\infty,\nu \otimes \gamma} \leq \|\sigma\|_{1,\nu \otimes \gamma} \|f\|_{2,\nu} \|g\|_{2,\nu}.$$

This shows that  $Q_\sigma \in \mathfrak{B}(L^2(d\nu))$  and  $\|Q_\sigma\|_* \leq \|\sigma\|_{1,\nu \otimes \gamma}$ .

We extend the definition of  $Q_\sigma$  and the two facts just proved to the case of  $\sigma \in L^1(d\nu \otimes d\gamma)$ , working as in the proof of [Theorem 4.1](#).

Finally, the Riesz–Thorin Theorem [[Stein 1956](#); [Stein and Weiss 1971](#)], allows us to generalize the same results from the cases  $p = 1$  and  $p = 2$  to all  $p \in [1, 2]$ .  $\square$

**Theorem 4.3.** *Let  $p \in [1, 2]$ . For  $\sigma \in L^p(d\nu \otimes d\gamma)$ , the operator  $Q_\sigma$  from  $L^2(d\nu)$  into itself is compact.*

*Proof.* Given  $\sigma \in L^p(d\nu \otimes d\gamma)$ , choose a sequence  $(\sigma_k)_{k \in \mathbb{N}}$  in  $D_*(\mathbb{R}^2)$  approximating  $\sigma$  in the  $\|\cdot\|_{p, \nu \otimes \gamma}$ -norm. The last assertion of [Theorem 4.2](#) says that

$$\|Q_{\sigma_k} - Q_\sigma\|_* \leq \|\sigma_k - \sigma\|_{p, \nu \otimes \gamma},$$

so  $Q_{\sigma_k}$  approaches  $Q_\sigma$  in  $\mathcal{B}(L^2(d\nu))$ . From [Theorem 3.6](#) we know that  $W_{\sigma_k} = Q_{\sigma_k}$  is compact for all  $k \in \mathbb{N}$ . The theorem then follows from the fact that the subspace  $\mathcal{K}(L^2(d\nu))$  of  $\mathcal{B}(L^2(d\nu))$  consisting of compact operators is a closed ideal of  $\mathcal{B}(L^2(d\nu))$ .  $\square$

## 5. The Weyl transform with symbol in $S'_{*,0}(\mathbb{R}^2)$

*Notation.* We denote by

- $S_{*,0}(\mathbb{R}^2)$  the subspace of  $S_*(\mathbb{R}^2)$  consisting of functions with compact support with respect to the first variable;
- $S'_{*,0}(\mathbb{R}^2)$  the topological dual of  $S_{*,0}(\mathbb{R}^2)$ ;
- $D'_*(\mathbb{R})$  the space of even distribution on  $\mathbb{R}$ . It is the topological dual of  $D_*(\mathbb{R})$ .

**Definition 5.1.** For  $\sigma \in S'_{*,0}(\mathbb{R}^2)$  and  $g \in D_*(\mathbb{R})$ , we define the operator  $W_\sigma(g)$  on  $D_*(\mathbb{R})$  by

$$(5-1) \quad (W_\sigma(g))(f) = \sigma(V(f, g)) \quad \text{for } f \in D_*(\mathbb{R}),$$

where  $V$  is the mapping from [Definition 2.1](#). Clearly  $W_\sigma(g)$  belongs to  $D'_*(\mathbb{R})$ .

**Proposition 5.2.** Consider the distribution  $\sigma$  of  $S'_{*,0}(\mathbb{R}^2)$  given by the constant function 1. For all  $g \in D_*(\mathbb{R})$ , we have

$$W_\sigma(g) = c\delta,$$

where  $c = \int_0^{+\infty} g(x) d\nu(x)$  and  $\delta$  is the Dirac distribution at 0.

*Proof.* For  $f, g \in D_*(\mathbb{R})$ , we get

$$(W_\sigma(g))(f) = \sigma(V(f, g)) = \int_0^{+\infty} \left( \int_0^{+\infty} V(f, g)(x, y) d\nu(x) \right) d\gamma(y).$$

But from the proof of [Theorem 2.5](#), we have

$$\int_0^{+\infty} V(f, g)(x, y) d\nu(x) = c\mathcal{F}f(y) \quad \text{for } y \in \mathbb{R}.$$

Integrating both sides over  $[0, +\infty[$  with respect to the measure  $d\gamma$  and using [\(1-8\)](#), we obtain

$$\sigma(V(f, g)) = (W_\sigma(g))(f) = c \int_0^{+\infty} \mathcal{F}f(y) d\gamma(y) = cf(0) = (c\delta, f). \quad \square$$

Note that by [Proposition 5.2](#), there exists  $\sigma \in S'_{*,0}(\mathbb{R}^2)$ , given by a function in  $L^\infty(d\nu \otimes d\gamma)$ , such that for all  $g \in D_*(\mathbb{R})$  satisfying  $c = \int_0^{+\infty} g(x) d\nu(x) \neq 0$ , the distribution  $W_\sigma(g)$  is *not* given by a function in  $L^2(d\nu)$ .

## 6. The Weyl transform with symbol in $L^p(d\nu \otimes d\gamma)$ , for $2 < p < \infty$

**Theorem 6.1.** *Let  $p \in ]2, \infty[$ . There exists a function  $\sigma \in L^p(d\nu \otimes d\gamma)$  such that the Weyl transform  $W_\sigma$  defined by (5–1) is not a bounded linear operator on  $L^2(d\nu)$ .*

We break down the proof into two lemmas, of which the theorem is an immediate consequence.

**Lemma 6.2.** *Let  $p \in ]2, \infty[$ . Suppose that for all  $\sigma \in L^p(d\nu \otimes d\gamma)$ , the Weyl transform  $W_\sigma$  given by (5–1) is a bounded linear operator on  $L^2(d\nu)$ . Then there exists a positive constant  $M$  such that*

$$(6-1) \quad \|W_\sigma\|_* \leq M \|\sigma\|_{p, \nu \otimes \gamma} \quad \text{for all } \sigma \in L^p(d\nu \otimes d\gamma).$$

*Proof.* Under the assumption of the lemma, there exists for each  $\sigma \in L^p(d\nu \otimes d\gamma)$  a positive constant  $C_\sigma$  such that

$$\|W_\sigma(g)\|_{2, \nu} \leq C_\sigma \|g\|_{2, \nu} \quad \text{for } g \in L^2(d\nu).$$

Let  $f, g \in D_*(\mathbb{R})$  be such that  $\|f\|_{2, \nu} = \|g\|_{2, \nu} = 1$  and define a linear operator  $Q_{f,g} : L^p(d\nu \otimes d\gamma) \rightarrow \mathbb{C}$  by

$$Q_{f,g}(\sigma) = \langle W_\sigma(g) / \bar{f} \rangle.$$

Then

$$\sup_{\|f\|_{2, \nu} = \|g\|_{2, \nu} = 1} |Q_{f,g}(\sigma)| \leq C_\sigma.$$

By the Banach–Steinhaus theorem, the operator  $Q_{f,g}$  is bounded on  $L^p(d\nu \otimes d\gamma)$ , so there exists  $M > 0$  such that

$$\|Q_{f,g}\| = \sup_{\|\sigma\|_{p, \nu \otimes \gamma} = 1} |Q_{f,g}(\sigma)| \leq M.$$

From this we deduce that for all  $f, g \in D_*(\mathbb{R})$  and  $\sigma \in L^p(d\nu \otimes d\gamma)$ ,

$$|\langle W_\sigma(g) / \bar{f} \rangle| \leq M \|\sigma\|_{p, \nu \otimes \gamma} \|f\|_{2, \nu} \|g\|_{2, \nu},$$

which implies (6–1). □

**Lemma 6.3.** *For  $2 < p < \infty$ , there is no positive constant  $M$  satisfying (6–1).*

*Proof.* Suppose there exists such an  $M$ . Let  $p'$  be such that  $1/p + 1/p' = 1$ . Then  $p' \in ]1, 2[$ . We consider, for  $f, g \in D_*(\mathbb{R})$ , the function  $V(f, g)$  of [Definition 2.1](#). We have

$$\begin{aligned} \|V(f, g)\|_{p', \nu \otimes \gamma} &= \sup_{\|\sigma\|_{p, \nu \otimes \gamma} = 1} \left| \int_0^{+\infty} \int_0^{+\infty} \sigma(x, y) V(f, g)(x, y) d\nu(x) d\gamma(y) \right| \\ &= \sup_{\|\sigma\|_{p, \nu \otimes \gamma} = 1} \left| \langle W_\sigma(g) / \bar{f} \rangle \right| \leq \sup_{\|\sigma\|_{p, \nu \otimes \gamma} = 1} \|W_\sigma(g)\|_{2, \nu} \|f\|_{2, \nu}, \end{aligned}$$

and consequently

$$(6-2) \quad \|V(f, g)\|_{p', \nu \otimes \gamma} \leq M \|f\|_{2, \nu} \|g\|_{2, \nu}.$$

Now consider  $f, g$  in  $L^2(d\nu)$ . Choose sequences  $(f_k)_{k \in \mathbb{N}}$  and  $(g_k)_{k \in \mathbb{N}}$  in  $D_*(\mathbb{R})$  approximating  $f$  and  $g$  in the  $\|\cdot\|_{2, \nu}$ -norm. By [Proposition 2.2](#), the sequence  $(V(f_k, g_k))_{k \in \mathbb{N}}$  converges to  $V(f, g)$  in  $L^{p'}(d\nu \otimes d\gamma)$ , and thus we have extended [\(6-2\)](#) to all  $f, g \in L^2(d\nu)$ . We will exhibit an example where this leads to a contradiction.

Let  $f$  be an even, measurable function on  $\mathbb{R}$ , supported in  $[-1, 1]$ . We have

$$|V(f, f)(x, y)| \leq |f| * |f|(x),$$

where  $*$  is the convolution product ([Definition 1.1](#)). From [\(1-7\)](#), we deduce that for all  $y \in \mathbb{R}$ , the function  $x \mapsto V(f, f)(x, y)$  is supported in  $[-2, 2]$ . Hölder's inequality gives

$$\begin{aligned} &\left( \int_0^{+\infty} \left| \int_0^2 V(f, f)(x, y) d\nu(x) \right|^{p'} d\gamma(y) \right)^{1/p'} \\ &\leq \left( \int_0^2 d\nu(x) \right)^{1/p} \left( \int_0^{+\infty} \left( \int_0^2 |V(f, f)(x, y)|^{p'} d\nu(x) \right) d\gamma(y) \right)^{1/p'} \\ &= \left( \int_0^2 d\nu(x) \right)^{1/p} \|V(f, f)\|_{p', \nu \otimes \gamma} \leq M \left( \int_0^2 d\nu(x) \right)^{1/p} \|f\|_{2, \nu}^2, \end{aligned}$$

the last inequality following from [\(6-2\)](#). This proves that the function

$$y \mapsto \int_0^{+\infty} V(f, f)(x, y) d\nu(x) = c \mathcal{F}f(y)$$

belongs to  $L^{p'}(d\gamma)$ ; here  $c = \int_0^{+\infty} f(x) d\nu(x)$ . and we have used the proof of [Theorem 2.5](#) for the equality on the right-hand side. Putting this together with the preceding inequality we see that, if  $c \neq 0$ , the function  $\mathcal{F}f$  belongs to  $L^{p'}(d\gamma)$  and

$$(6-3) \quad \|\mathcal{F}f\|_{p', \gamma} \leq \frac{M}{|c|} \left( \int_0^2 d\nu(x) \right)^{1/p} \|f\|_{2, \nu}^2.$$

Now consider the particular function  $f$  given by

$$f(x) = \frac{|x|^r}{\sqrt{B(x)}} \mathbf{1}_{[-1,1]}(x)$$

where  $B$  is the function defined by (1-1) and  $\mathbf{1}_{[-1,1]}$  is the characteristic function of the interval  $[-1, 1]$ . If  $r > -(\alpha + 1)$ , this function belongs to  $L^1(d\nu) \cap L^2(d\nu)$ . From (1-4) we get

$$\begin{aligned} \mathcal{F}f(\lambda) &= \int_0^1 x^{r+2\alpha+1} j_\alpha(\lambda x) dx + \int_0^1 x^{r+\alpha+1/2} \theta_\lambda(x) dx \\ &= \frac{1}{\lambda^{r+2\alpha+2}} \int_0^\lambda x^{r+2\alpha+1} j_\alpha(x) dx + \int_0^1 x^{r+\alpha+1/2} \theta_\lambda(x) dx. \end{aligned}$$

Using the asymptotic expansion of the function  $j_\alpha$  [Lebedev 1972; Watson 1944], given by

$$j_\alpha(x) = \frac{2^{\alpha+1/2} \Gamma(\alpha+1)}{\sqrt{\pi} x^{\alpha+1/2}} \left( \cos\left(x - \alpha \frac{\pi}{2} - \frac{\pi}{4}\right) + O\left(\frac{1}{x}\right) \right) \quad \text{as } x \rightarrow +\infty,$$

we deduce that for  $-(\alpha + 1) < r < -(\alpha + \frac{1}{2})$ , the integral

$$a := \int_0^{+\infty} x^{r+2\alpha+1} j_\alpha(x) dx$$

exists and is finite, so

$$\frac{1}{\lambda^{r+2\alpha+2}} \int_0^\lambda x^{r+2\alpha+1} j_\alpha(x) dx \sim \frac{a}{\lambda^{r+2\alpha+2}} \quad \text{as } \lambda \rightarrow +\infty.$$

On the other hand, for  $\lambda > 1$ ,

$$\left| \int_0^1 x^{r+\alpha+1/2} \theta_\lambda(x) dx \right| \leq \frac{c_1}{\lambda^{\alpha+3/2}} \int_0^1 x^{r+\alpha+1/2} \Psi(x) dx,$$

where

$$\Psi(x) = \left( \int_0^x |Q(s)| ds \right) \exp\left(c_2 \int_0^x |Q(s)| ds\right) \quad \text{for all } x > 0$$

and  $Q$  is given by (1-5). Since  $-(\alpha + 1) < r < -(\alpha + \frac{1}{2})$ , we deduce that

$$\mathcal{F}f(\lambda) \sim \frac{a}{\lambda^{r+2\alpha+2}} \quad \text{as } \lambda \rightarrow +\infty.$$

Using this and (1-6), it follows that there exist  $K, R > 0$  such that

$$|\mathcal{F}f(\lambda)|^{p'} \frac{1}{2\pi |c(\lambda)|^2} \geq \frac{K}{\lambda^{p'(r+2\alpha+2)-2\alpha-1}} \quad \text{for } \lambda > R;$$

so for  $r$  such that  $p'(r + 2\alpha + 2) < 2\alpha + 2$ , we get

$$\|\mathcal{F}f\|_{p',\gamma}^{p'} \geq \int_R^{+\infty} |\mathcal{F}f(\lambda)|^{p'} \frac{d\lambda}{2\pi |c(\lambda)|^2} \geq \int_R^{+\infty} \frac{K}{\lambda^{p'(r+2\alpha+2)-2\alpha-1}} d\lambda = +\infty.$$

This shows that the relation (6–3) is false if we choose  $r$  so as to satisfy simultaneously the conditions  $r > -(\alpha + 1)$ ,  $r < -(\alpha + \frac{1}{2})$  and

$$r < -(2\alpha + 2) + \frac{2\alpha + 2}{p'}.$$

This contradiction proves the lemma and [Theorem 6.1](#). □
