TWO INFINITE VERSIONS OF THE NONLINEAR DVORETZKY THEOREM

KEI FUNANO
TWO INFINITE VERSIONS OF THE NONLINEAR DVORETZKY THEOREM

KEI FUNANO

We make two additions to recent results of Mendel and Naor on nonlinear versions of Dvoretzky’s theorem. We consider the cases of metric spaces with infinite Hausdorff dimension and countably infinite metric spaces.

1. Introduction and the statement of the results

We say that a metric space $X$ is \textit{embedded} with distortion $D \geq 1$ in a metric space $Y$ if there exist a map $f : X \to Y$ and a constant $r > 0$ such that

$$r \, d_X(x, y) \leq d_Y(f(x), f(y)) \leq Dr \, d_X(x, y) \quad \text{for all } x, y \in X.$$  

Such a map $f$ is called a $D$-embedding.

Dvoretzky’s theorem [1961] states that for every $\epsilon > 0$, every $n$-dimensional normed space contains a $k(n, \epsilon)$-dimensional subspace that embeds into a Hilbert space with distortion $1 + \epsilon$. This theorem was conjectured by Grothendieck [1953]. See [Milman 1971; 1992; Milman and Schechtman 1999; Schechtman 2006; 2011] for the estimates of $k(n, \epsilon)$ and the further developments related to this theorem.

Bourgain, Figiel, and Milman proved a natural nonlinear variant of Dvoretzky’s theorem:

\textbf{Theorem 1.1} [Bourgain et al. 1986]. \textit{There exists two universal constants $c_1, c_2 > 0$ such that for every $\epsilon > 0$, every finite metric space $X$ contains a subset $S$ that embeds into a Hilbert space with distortion $1 + \epsilon$ and}

$$|S| \geq \frac{c_1 \epsilon}{\log(c_2/\epsilon)} \log |X|.$$  

See [Bartal et al. 2005; Mendel and Naor 2007; Naor and Tao 2012] for further discussion. It is natural to try to get some versions of the above theorem in the case where $|X| = \infty$. In this paper we prove the following.

This work was partially supported by Grant-in-Aid for Research Activity (startup), grant number 23840020.

\textit{MSC2010:} 53C23.

\textit{Keywords:} Dvoretzky’s theorem, ultrametric space.
Theorem 1.2. For every $\varepsilon > 0$, every countable infinite metric space $X$ has an infinite subset which embeds into an ultrametric space with distortion $1 + \varepsilon$.

Recall that a metric space $(U, \rho)$ is called an ultrametric space if for every $x, y, z \in X$ we have $\rho(x, y) \leq \max\{\rho(x, z), \rho(z, y)\}$. Since every separable ultrametric space isometrically embeds into a Hilbert space [Vestfrid and Timan 1979], we verify that Theorem 1.1 holds in the case where $|X| = \infty$.

Recently Mendel and Naor [2012] proved another variant of Dvoretzky’s theorem, answering a question by T. Tao. For a metric space $X$ we denote its Hausdorff dimension by $\dim_H X$. A subset of a complete separable metric space is called an analytic set if it is an image of a complete separable metric space under a continuous map. Note that analytic sets are not necessarily complete. For example, any Borel subset of a complete separable metric space is an analytic set (refer to [Kechris 1995] for analytic sets).

Theorem 1.3 (compare [Mendel and Naor 2012, Theorem 1.7]). There exists a universal constant $c \in (0, \infty)$ such that for every $\varepsilon \in (0, \infty)$, every analytic set $X$ whose Hausdorff dimension is finite has a closed subset $S \subseteq X$ that embeds with distortion $2 + \varepsilon$ in an ultrametric space, and

$$\dim_H S \geq \frac{c \varepsilon}{\log(1/\varepsilon)} \dim_H X.$$ 

Mendel and Naor [2012] stated this theorem only for compact metric spaces. As remarked in their introduction, the theorem is valid for more general metric spaces. For example, the theorem holds for every analytic set $X$, since the problem can be reduced to the case of a compact subset of $X$ with the same Hausdorff dimension (see [Carleson 1967; Howroyd 1995, Corollary 7]).

In the following theorem we consider the case where $\dim_H X = \infty$.

Theorem 1.4. For every $\varepsilon \in (0, \infty)$, every analytic set $X$ whose Hausdorff dimension is infinite has a closed subset $S$ that can be embedded into an ultrametric space with distortion $2 + \varepsilon$ and has infinite Hausdorff dimension.

It follows from the proof of Theorem 1.3 in [Mendel and Naor 2012] that if $\dim_H X = \infty$, then $X$ contains an arbitrary large-dimensional closed subset that embeds into an ultrametric space. Combining Theorem 1.3 with Theorem 1.4 we find that a nonlinear Dvoretzky theorem holds for all analytic sets.

The following theorem asserts that the distortion in Theorems 1.3 and 1.4 cannot be strictly less than two.

Theorem 1.5 [Mendel and Naor 2012, Theorem 1.8]. For every $\alpha > 0$ there exists a compact metric space $(X, d)$ of Hausdorff dimension $\alpha$, such that if $S \subseteq X$ embeds into a Hilbert space with distortion strictly smaller than 2 then $\dim_H S = 0$. 

Theorem 1.5 immediately implies that the same result holds in the case \( \alpha = \infty \).

It is known that \( \ell_2 \) does not embed into \( \ell_p \) with finite distortion for any \( p \) in \( [1, \infty) \setminus \{2\} \) \cite{AlbiacKalton2006}. In particular, an infinite-dimensional analogue of Dvoretzky’s theorem is no longer true in the linear setting. In contrast to this fact, Theorem 1.4 asserts that an infinite-dimensional Dvoretzky theorem holds in the nonlinear setting.

2. Proof

**Lemma 2.1.** Let \( X \) be a separable metric space such that \( \dim_H X = \infty \). Then there exists a sequence \( \{K_i\}_{i=1}^{\infty} \) of mutually disjoint closed subsets of \( X \) such that

\[
\lim_{i \to \infty} \text{diam } K_i = 0 \quad \text{and} \quad \lim_{i \to \infty} \dim_H K_i = \infty.
\]

**Proof.** For every \( x \in X \) we take a closed neighborhood \( K_x \) of \( x \) with \( \text{diam } K_x \leq 1 \). Since \( X \) is separable, applying the Lindelöf covering theorem we get a countable subset \( F \subseteq X \) such that \( X = \bigcup_{x \in F} K_x \). Since

\[
\dim_H \left( \bigcup_{x \in F} K_x \right) = \sup_{x \in F} \dim_H K_x,
\]

there exists \( x_1 \in F \) such that \( \dim_H K_{x_1} = \infty \) or there exists a sequence \( \{y_i\}_{i=1}^{\infty} \subseteq F \) such that \( \{\dim_H K_{y_i}\}_{i=1}^{\infty} \) is strictly increasing and \( \lim_{i \to \infty} \dim_H K_{y_i} = \infty \).

We first consider the latter case. We put \( K_1 := K_{y_1} \). By the monotonicity of \( \dim_H K_{y_i} \) we have \( \dim_H (K_{y_i} \setminus \bigcup_{j=1}^{i-1} K_{y_j}) = \dim_H K_{y_i} \) for \( i \geq 2 \). Covering \( K_{y_i} \setminus \bigcup_{j=1}^{i-1} K_{y_j} \) by countably many closed subsets of diameter \( \leq 1/i \), we thus find a closed subset \( K_i \subseteq K_{y_i} \setminus \bigcup_{j=1}^{i-1} K_{y_j} \) such that \( \dim_H K_i = \dim_H K_{y_i} \) and \( \text{diam } K_i \leq 1/i \). This \( \{K_i\}_{i=1}^{\infty} \) is the desired sequence.

We now consider the former case. Covering \( K_{x_1} \) by countably many closed subsets \( \{K_y^1\}_{y \in F_1} \) so that \( \text{diam } K_y^1 \leq 2^{-1} \text{ diam } K_{x_1} \), we have two cases: There exists \( x_2 \in F_1 \) such that \( \dim_H K_x^1 = \infty \) or there exists a sequence \( \{y_i\}_{i=1}^{\infty} \subseteq F_1 \) such that \( \{\dim_H K_{y_i}^1\}_{i=1}^{\infty} \) is strictly increasing and \( \lim_{i \to \infty} \dim_H K_{y_i}^1 = \infty \). Since we have already proved the lemma in the latter case, we consider the former case. Continuing this process we may assume there is a chain \( K_{x_2}^1 \supseteq K_{x_3}^2 \supseteq K_{x_4}^3 \supseteq \cdots \) of closed subsets of \( X \) such that

\[
\dim_H K_{x_i}^{i-1} = \infty \quad \text{and} \quad \text{diam } K_{x_i}^i \leq 2^{-i} \text{ diam } K_{x_i}^{i-1}.
\]

Since \( K_{x_i}^{i-1} \setminus \bigcup_{j=i}^{\infty} (K_{x_j}^{j-1} \setminus K_{x_{j+1}}^j) \) consists of at most one point, we get

\[
\limsup_{i \to \infty} \dim_H (K_{x_i}^{i-1} \setminus K_{x_{i+1}}^i) = \infty.
\]
By taking a subsequence we may assume that \( \lim_{i \to \infty} \dim_H(K_{x_i}^{i-1} \setminus K_{x_{i+1}}^i) = \infty \).

Taking a closed \( K_i \subseteq K_{x_i}^{i-1} \setminus K_{x_{i+1}}^i \) such that \( \dim_H K_i \geq 2^{-1} \dim_H(K_{x_i}^{i-1} \setminus K_{x_{i+1}}^i) \) we easily see that this \( \{K_i\}_{i=1}^\infty \) is the desired sequence. \( \square \)

We first prove Theorem 1.4. It turns out that Theorem 1.2 follows from the proof of Theorem 1.4.

**Proof of Theorem 1.4.** We take a sequence \( \{K_i\}_{i=1}^\infty \) of closed subsets of \( X \) in Lemma 2.1. For each \( i \) we fix an element \( x_i \in K_i \). Note that closed subsets of analytic sets are also analytic sets. By Theorem 1.3 there exist \( A_i \subseteq K_i \) such that \( \lim_{i \to \infty} \dim_H A_i = \infty \) and \( A_i \) embeds into some ultrametric space \((U_i, \rho_i)\) with distortion \( 2+\varepsilon \), i.e., there exist \( f_i: A_i \to U_i \) satisfying

\[
(2-1) \quad d(x, y) \leq \rho_i(f_i(x), f_i(y)) \leq (2+\varepsilon)d(x, y) \quad \text{for any } x, y \in A_i.
\]

We divide the proof into three cases.

**Case 1.** \( \{x_i\}_{i=1}^\infty \) is not bounded.

By taking a subsequence we may assume that \( \lim_{n \to \infty} d(x_1, x_n) = \infty \) and that \( \operatorname{diam} K_i \leq 1/(2+\varepsilon) \). By taking a further subsequence we may also assume that

\[
(2-2) \quad 1 \leq \min\left\{ \frac{\sqrt{1+\varepsilon}-1}{\sqrt{1+\varepsilon}\sqrt{1+2^{-1}\varepsilon}}, \frac{\sqrt{1+\varepsilon}-\sqrt{1+2^{-1}\varepsilon}}{\sqrt{1+2^{-1}\varepsilon}}, \frac{\sqrt{1+2^{-1}\varepsilon}-1}{2} \right\} d(A_1, A_2)
\]

and

\[
(2-3) \quad d(A_1, A_{i-1}) \leq \min\left\{ \frac{\sqrt{1+\varepsilon}-1}{\sqrt{1+\varepsilon}\sqrt{1+2^{-1}\varepsilon}}, \frac{\sqrt{1+\varepsilon}-\sqrt{1+2^{-1}\varepsilon}}{\sqrt{1+2^{-1}\varepsilon}}, \frac{\sqrt{1+2^{-1}\varepsilon}-1}{2} \right\} d(A_1, A_i)
\]

for any \( i \geq 2 \). Put \( R_i := d(A_i, A_1) \) for \( i \geq 2 \). Note that \( \operatorname{diam} f_i(A_i) \leq 1 \) since \( f_i \) satisfies (2-1) and \( \operatorname{diam} A_i \leq \operatorname{diam} K_i \leq 1/(2+\varepsilon) \).

For each \( i \geq 2 \) we take a point \( u_{i,0} \) not in \( f_i(A_i) \) and put \( Y_i := f_i(A_i) \cup \{u_{i,0}\} \). Define the distance function \( \tilde{\rho}_i \) on \( Y_i \) as follows: \( \tilde{\rho}_i(u, u_{i,0}) := R_i \) for \( u \in f_i(A_i) \) and \( \tilde{\rho}_i(u, v) := \rho_i(u, v) \) for \( u, v \in f_i(A_i) \). Since \( \operatorname{diam} f_i(A_i) \leq 1 \leq R_i \), each \( (Y_i, \tilde{\rho}_i) \) is an ultrametric space. Let us consider the space

\[
(2-4) \quad U := \left\{ (u_i) \in \prod_{i=2}^\infty Y_i \mid u_i \neq u_{i,0} \text{ only for finitely many } i \right\}
\]

and define the distance function \( \rho \) on \( U \) by

\[
(2-5) \quad \rho((u_i), (v_i)) := \sup_i \tilde{\rho}_i(u_i, v_i).
\]

It is easy to verify that \( (U, \rho) \) is an ultrametric space. For each \( x \in A_i \) we put

\[
(2-6) \quad f(x) := (u_{2,0}, u_{3,0}, \ldots, u_{i-1,0}, f_i(x), u_{i+1,0}, u_{i+2,0}, \ldots).
\]
We shall prove that \( f \) is a \((2 + \varepsilon)\)-embedding from the closed subset \( \bigcup_{i=2}^{\infty} A_i \subseteq X \) to the ultrametric space \((U, \rho)\). Note that \( \dim H(\bigcup_{i=2}^{\infty} A_i) = \infty \).

We take two arbitrary points \( x \in A_i \) and \( y \in A_j \) \((i < j)\) and fix \( z \in A_1 \). By (2-2) and (2-3), we get
\[
d(x, z) \leq R_i + \text{diam } A_1 + \text{diam } A_i \leq R_i + 2 \leq \sqrt{1 + 2^{-1}\varepsilon} R_i.
\]
Combining this inequality with (2-2) and (2-3) also implies
\[
d(x, y) \geq d(y, z) - d(x, z) \geq R_j - \sqrt{1 + 2^{-1}\varepsilon} R_i
\geq \frac{1}{\sqrt{1 + \varepsilon}} R_j = \frac{1}{\sqrt{1 + \varepsilon}} \rho(f(x), f(y)),
\]
and
\[
d(x, y) \leq d(x, z) + d(y, z) \leq \sqrt{1 + 2^{-1}\varepsilon} R_i + \sqrt{1 + 2^{-1}\varepsilon} R_j
\leq \sqrt{1 + \varepsilon} R_j = \sqrt{1 + \varepsilon} \rho(f(x), f(y)).
\]
Hence \( f \) is a \((2 + \varepsilon)\)-embedding.

**Case 2.** \( \{x_i\}_{i=1}^{\infty} \) is bounded but not totally bounded.

By taking a subsequence, we may assume that there exist two constants \( c_1, c_2 > 0 \) such that
\[
c_1 \leq d(x_i, x_j) \leq c_2 \text{ for any distinct } i, j.
\]
For any \( \delta > 0 \) we divide \( [c_1, c_2] = \bigcup_{j=1}^{m} I_j \) so that \( \text{diam } I_j < \delta \) for any \( j \).

Pick \( j_1 \in \{1, 2, \ldots, m\} \) such that \( d(x_i, x_1) \in I_{j_1} \) holds for infinitely many \( i \). Put
\[
X_1 := \{x_i \mid d(x_i, x_1) \in I_{j_1}\} = \{x_{k_1(1)}, x_{k_1(2)}, \ldots\}.
\]
We then choose \( j_2 \in \{1, 2, \ldots, m\} \) so that \( d(x_{k_1(i)}, x_{k_1(1)}) \in I_{j_2} \) holds for infinitely many \( i \) and put
\[
X_2 := \{x_{k_1(i)} \in X_1 \mid d(x_{k_1(i)}, x_{k_1(1)}) \in I_{j_2}\} = \{x_{k_2(1)}, x_{k_2(2)}, \ldots\}.
\]
Repeatedly we obtain a sequence \( \{j_l\}_{l=1}^{\infty} \) whose terms are elements of the set \( \{1, 2, \ldots, m\} \) and \( X_l = \{x_{k_1(1)}, x_{k_1(2)}, \ldots\} \). By a pigeonhole argument we find a subsequence \( \{j_{h(l)}\}_{l=1}^{\infty} \subseteq \{j_l\}_{l=1}^{\infty} \) that is monochromatic, i.e., \( j_{h(l)} \equiv l \) for some \( l \in \{1, 2, \ldots, m\} \). We then get \( d(x_{k_{h(l)}(i)}, x_{k_{h(l)}(j)}) \in I_l \). Since \( \text{diam } I_l < \delta \) and \( \lim_{l \to \infty} \text{diam } A_i = 0 \), by choosing sufficiently small \( \delta \) and taking a subsequence, we see that there exists a number \( \alpha \geq c_1 \) such that

\[
(2-7) \quad \alpha \leq d(u, v) \leq (1 + \varepsilon)\alpha \quad \text{for any } u \in A_i \text{ and } v \in A_j \text{ } (i \neq j)
\]
and \( \text{diam } A_i \leq (2 + \varepsilon)^{-1}\alpha \). As in Case 1 we take a point \( u_{i,0} \) not in \( f_i(A_i) \) and put
$Y_i := f_i(A_i) \cup \{u_i, 0\}$. We define the distance function $\tilde{\rho}_i$ on $Y_i$ by

$$\tilde{\rho}_i(u, u_i, 0) := \alpha \quad \text{and} \quad \tilde{\rho}_i(u, v) := \rho_i(u, v)$$

for $u, v \in f_i(A_i)$. Since $\text{diam } f_i(A_i) \leq (2 + \varepsilon) \text{diam } A_i \leq \alpha$, each $(Y_i, \tilde{\rho}_i)$ is an ultrametric space. From these $(Y_i, \tilde{\rho}_i)$ we construct an ultrametric space $(U, \rho)$ by (2-4) and (2-5). Then a map $f: \bigcup_{i=2}^{\infty} A_i \rightarrow (U, \rho)$ defined by (2-6) is a $(2 + \varepsilon)$-embedding.

**Case 3.** $\{x_i\}_{i=1}^{\infty}$ is totally bounded.

The proof is similar to Case 1. From total boundedness, by taking a subsequence, we may assume that $\{x_i\}_{i=1}^{\infty}$ is a Cauchy sequence. Since $\lim_{i \rightarrow \infty} \text{diam } A_i = 0$, the sequence $\{A_i\}_{i=1}^{\infty}$ Hausdorff converges to a point $x_\infty$. Let $\delta > 0$ be specified later. Note that $x_\infty \not\in A_i$ for any sufficiently large $i$ since $A_i$ are mutually disjoint closed subsets of $X$. Hence, by taking a subsequence, we may also assume that $d(A_i, x_\infty)/d(A_{i-1}, x_\infty) \leq \delta$ for each $i$. Covering $A_i$ by countably many closed subsets $\{B_{ij}\}_j$ of diameter $\leq \delta d(A_i, x_\infty)$ we find a subset $B_{ij}$ such that $\text{dim}_H(B_{ij}) \geq 2^{-1} \text{dim}_H(A_i)$ and

$$\frac{\text{diam } B_{ij}}{d(B_{ij}, x_\infty)} \leq \frac{\text{diam } B_{ij}}{d(A_i, x_\infty)} \leq \delta.$$  

Hence by replacing $A_i$ with $B_{ij}$, we may assume that $\text{diam } A_i/d(A_i, x_\infty) \leq \delta$ for every $i$.

As in Cases 1 and 2 we add a point $u_{i, 0}$ to $f_i(A_i)$ and put $Y_i := f_i(A_i) \cup \{u_i, 0\}$. Define the distance function $\tilde{\rho}_i$ on $Y_i$ by

$$\tilde{\rho}_i(u, u_i, 0) := d(A_i, x_\infty) \quad \text{and} \quad \tilde{\rho}_i(u, v) := \rho_i(u, v)$$

for $u, v \in f_i(A_i)$. If $\delta \leq (2 + \varepsilon)^{-1}$, then we have

$$\text{diam } f_i(A_i) \leq (2 + \varepsilon) \text{ diam } A_i \leq d(A_i, x_\infty),$$

which implies that each $(Y_i, \tilde{\rho}_i)$ is an ultrametric space. From these $(Y_i, \tilde{\rho}_i)$ we define an ultrametric space $(U, \rho)$ by (2-4) and (2-5). If we trace the proof of Case 1 by replacing $R_i$ with $d(A_i, x_\infty)$, then we easily see that a map $f: \bigcup_{i=2}^{\infty} A_i \rightarrow (U, \rho)$ defined by (2-6) is a $(2 + \varepsilon)$-embedding, provided that $\delta > 0$ is small enough. \(\square\)

**Proof of Theorem 1.2.** Let $X := \{x_1, x_2, \ldots\}$. Apply the proof of Theorem 1.4 by identifying each $x_i$ with $K_i$. Note that the loss of the distortion in the proof only comes from (2-1), which we can ignore in the case where $A_i = x_i$. Hence the space $X$ can be embedded into an ultrametric space with distortion $1 + \varepsilon$. \(\square\)

**Remark 2.2.** After this work was completed, the author proved in [Funano 2012] that every proper ultrametric space isometrically embeds into $\ell_p$ for any $p \geq 1$. In particular the subset $S$ in Theorem 1.3 also embeds into $\ell_p$. Theorems 1.2 and 1.4
also hold in the case where the target metric space is $\ell_p$ instead of an ultrametric space. In fact, in the proof of Theorem 1.4, observe that we may assume that $A_i$ is compact [Carleson 1967; Howroyd 1995, Corollary 7]. Since $\bigcup_{i=2}^{\infty} A_i$ is a proper subset which embeds into an ultrametric space in the case of Cases 1 and 3, we consider only Case 2. Since we have (2-7) in Case 2 we easily see that $\bigcup_{i=2}^{\infty} A_i$ embeds into $\ell_p$. It was mentioned in [Funano 2012, Proposition 3.4] that an $\ell_p$ analogue of Theorem 1.5 also holds.

**Acknowledgements**

The author would like to express his thanks to Mr. Takumi Yokota for his suggestion regarding the two theorems in this paper and Mr. Ryokichi Tanaka for discussion. The author also thanks Professor Manor Mendel and Professor Assaf Naor for their useful comments. The author is also indebted to an anonymous referee for carefully reading this paper and making helpful comments.
