MAPS FROM THE ENVELOPING ALGEBRA OF THE
POSITIVE WITT ALGEBRA TO REGULAR ALGEBRAS

SUSAN J. SIERRA AND CHELSEA WALTON

We construct homomorphisms from the universal enveloping algebra of the positive (part of the) Witt algebra to several different Artin–Schelter regular algebras, and determine their kernels and images. As a result, we produce elementary proofs that the universal enveloping algebras of the Virasoro algebra, the Witt algebra, and the positive Witt algebra are neither left nor right noetherian.

0. Introduction

Let \( k \) be a field of characteristic 0. All vector spaces, algebras, and tensor products are over \( k \), unless stated otherwise. In this work, we construct and study homomorphisms from the universal enveloping algebra of the positive part of the Witt algebra to Artin–Schelter (AS-)regular algebras. The latter serve as homological analogues of commutative polynomial rings in the field of noncommutative algebraic geometry.

To begin, consider the Lie algebras below.

Definition 0.1 \((V, W, W_+)\). We define the following Lie algebras:

(a) The Virasoro algebra is defined to be the Lie algebra \( V \) with basis \( \{e_n\}_{n \in \mathbb{Z}} \cup \{c\} \) and Lie bracket \( [e_n, c] = 0 \), \( [e_n, e_m] = (m - n)e_{n+m} + \frac{1}{12} c(m^3 - m) \delta_{n+m,0} \).

(b) The Witt (or centerless Virasoro) algebra is defined to be the Lie algebra \( W \) with basis \( \{e_n\}_{n \in \mathbb{Z}} \) and Lie bracket \( [e_n, e_m] = (m - n)e_{n+m} \).

(c) The positive (part of the) Witt algebra is defined to be the Lie subalgebra \( W_+ \) of \( W \) generated by \( \{e_n\}_{n \geq 1} \).

For any Lie algebra \( \mathfrak{g} \), we denote its universal enveloping algebra by \( U(\mathfrak{g}) \).

Further, consider the following algebras.

MSC2010: 14A22, 16S30, 16S38, 17B68.

Keywords: Artin–Schelter regular, Jordan plane, non-noetherian, universal enveloping algebra, Witt algebra.
Notation 0.2 \((S, R)\). Let \(S\) be the algebra generated by \(u, v, w\), subject to the relations
\[
uv - vu - v^2 = uw - wu - vw = vw - wv = 0.
\]
Let \(R\) be the Jordan plane generated by \(u, v\), subject to the relation \(uv - vu - v^2 = 0\).

It is well known that \(R\) is an AS-regular algebra of global dimension 2. Moreover, we see by Lemma 1.3 that \(S\) is also AS-regular, of global dimension 3.

This work focuses on maps that we construct from the enveloping algebra \(U(W_+)\) to both \(R\) and \(S\), given as follows:

Definition 0.3 \((\phi, \lambda_a)\). Let \(\phi : U(W_+) \to S\) be the algebra homomorphism induced by defining
\[
\phi(e_n) = (u - (n - 1)w)v^{n-1}.
\]
For \(a \in \mathbb{k}\), let \(\lambda_a : U(W_+) \to R\) be the algebra homomorphism induced by defining
\[
\lambda_a(e_n) = (u - (n - 1)av)v^{n-1}.
\]
That \(\phi\) and \(\lambda_a\) are well defined is Lemma 1.5.

Our main result is that we understand fully the kernels and images of the maps above, as presented below.

Theorem 0.6. We have the following statements about the kernels and images of the maps \(\phi\) and \(\lambda_a\).

(a) [Propositions 2.5, 2.8] \(\ker \lambda_a\) is equal to the ideal \((e_1e_3 - e_2^2 - e_4)\) if \(a = 0, 1\); or is an ideal generated by one element of degree 5 and two elements of degree 6 (listed in Proposition 2.8) if \(a \neq 0, 1\).

(b) [Proposition 2.1] \(\lambda_a(U(W_+))\) is equal to \(\mathbb{k} + uR\) if \(a = 0\); is equal to \(\mathbb{k} + Ru\) if \(a = 1\); or contains \(R_{\geq 4}\) if \(a \neq 0, 1\). For all \(a\), the image of \(\lambda_a\) is noetherian.

(c) [Theorem 5.1] \(\ker \phi\) is equal to \((e_1e_5 - 4e_2e_4 + 3e_3^2 + 2e_6)\).

The image of \(\phi\) will be discussed later in the introduction, after Theorem 0.10.

The result above has a surprising application. In [Sierra and Walton 2014, Theorem 0.5 and Corollary 0.6], we established that \(U(W_+), U(W), U(V)\) are neither left nor right noetherian through relatively indirect means, using the techniques of [Sierra 2011]. In particular, we were not able to give an example of a non-finitely-generated right or left ideal in any of these enveloping algebras. However, in the course of proving Theorem 0.6, we produce an elementary and constructive proof of [Sierra and Walton 2014, Theorem 0.5 and Corollary 0.6]. Namely, we obtain:

Theorem 0.7 (Proposition 2.5, Theorem 3.3). The ideal
\[
\ker \lambda_0 = \ker \lambda_1 = (e_1e_3 - e_2^2 - e_4)
\]
is not finitely generated as either a left or a right ideal of \(U(W_+)\).
We prove this theorem by noting that $\lambda_0$ factors through $\phi$, and by studying $B := \phi(U(W_+))$. A key step is to compute $I := \phi(\ker \lambda_0)$, and to show that $I$ is not finitely generated as a left or right ideal of $B$.

Note that the map (0.5) can be extended to $W$ to define a map, which we denote by

$$\hat{\lambda}_a : U(W) \rightarrow R[v^{-1}].$$

**Theorem 0.8 ((3.10), Theorem 3.12).** The ideal $\ker \hat{\lambda}_0 = \ker \hat{\lambda}_1$ is not finitely generated as either a left or right ideal of $U(W)$.

We remark that $R[v^{-1}]$ is isomorphic to the ring $k[x, x^{-1}, \partial]$, which is a familiar localization of the Weyl algebra. To see this, set $v = x$ and $u = x^2 \partial$, so $\partial x = x \partial + 1$. Then $uv - vu = x^2 = v^2$. We obtain

$$\hat{\lambda}_1(e_n) = v^{n-1}u = x^{n+1}\partial.$$

Thus, $\hat{\lambda}_1$ is a well-known homomorphism.

We now compare Theorem 0.7 with our earlier proof (in [Sierra and Walton 2014]) that $U(W_+)$ is not left or right noetherian. The earlier proof used a ring homomorphism $\rho$ with a more complicated definition:

**Notation 0.9** $(X, f, \tau, \rho)$. Take $\mathbb{P}^3 := \mathbb{P}^3_k$ with coordinates $w, x, y, z$. Let $X = V(xz - y^2) \subseteq \mathbb{P}^3$ be the projective cone over a smooth conic in $\mathbb{P}^2$.

Define an automorphism $\tau$ of $X$ by

$$\tau([w : x : y : z]) = [w - 2x + 2z : z : -y - 2z : x + 4y + 4z].$$

Denote the pullback of $\tau$ on $k(X)$ by $\tau^*$, so that $g^{\tau} := \tau^* g = g \circ \tau$ for $g \in k(X)$. Form the ring $k(X)[t; \tau^*]$ with multiplication $tg = g^{\tau}t$ for all $g \in k(X)$. Let

$$f := \frac{w + 12x + 22y + 8z}{12x + 6y},$$

considered as a rational function in $k(X)$. Now let $\rho : U(W_+) \rightarrow k(X)[t; \tau^*]$ be the algebra homomorphism induced by setting $\rho(e_1) = t$ and $\rho(e_2) = f^{t^2}$.

That $\rho$ is well defined is [Sierra and Walton 2014, Proposition 1.5]. The method in that paper made a number of reductions to show that $\rho(U(W_+))$ is not left or right noetherian. That proof can now be streamlined via the next result.

**Theorem 0.10 (Theorem 4.1).** We have that $\ker \rho = \ker \phi = \bigcap_{a \in k} \ker \lambda_a$.

Since we show that $\phi(U(W_+))$ is not left or right noetherian in the course of proving Theorem 0.7, we have by Theorems 0.6(c) and 0.10 that $\rho(U(W_+)) \cong \phi(U(W_+)) \cong U(W_+)/\langle e_1 e_5 - 4e_2 e_4 + 3e_3^2 + 2e_6 \rangle$ is neither left nor right noetherian.

We end by discussing an open question that was brought to our attention by Lance Small.
Question 0.11. Does $U(W_+)$ satisfy the ascending chain condition on *two-sided* ideals?

Our result here is only partial:

**Proposition 0.12 (Proposition 6.6).** The ring $B := \phi(U(W_+))$ satisfies the ascending chain condition on two-sided ideals.

Of course, this yields no direct information on the question for $U(W_+)$.

We have the following conventions throughout the paper. We take $\mathbb{N} = \mathbb{Z}_{\geq 0}$ to be the set of nonnegative integers. If $r$ is an element of a ring $A$, then $(r)$ denotes the two-sided ideal $ArA$ generated by $r$. If $A = \bigoplus_{n \in \mathbb{Z}} A_n$ is a graded $k$-algebra (or graded module), then we define the Hilbert series

$$\text{hilb } A = \sum_{n \in \mathbb{Z}} \dim_k A_n t^n.$$  

This article is organized as follows. We present preliminary results in Section 1, including an alternative way of multiplying elements in $S$ and in $R$ (Lemma 1.3); this method will be employed throughout, sometimes without mention. In Section 2, we discuss the maps $\lambda_a$ and prove parts (a) and (b) of Theorem 0.6. In Section 3 we use the map $\lambda_0$ to establish Theorem 0.7; we also prove Theorem 0.8.

Before proceeding to study the map $\phi$, we present its connection with the map $\rho$, the key homomorphism of [Sierra and Walton 2014]. Namely, in Section 4, we establish Theorem 0.10. Then in Section 5, we verify part (c) of Theorem 0.6. Our last result, Proposition 0.12, is presented in Section 6. Proofs of computational claims via Maple and Macaulay2 routines and a known result in ring theory to which we could not find a reference are provided in the Appendix.

1. Preliminaries

The main focus of this paper is the universal enveloping algebra of the positive Witt algebra, $W_+$. To begin, we recall some basic facts about the algebra $U(W_+)$.

**Lemma 1.1.** Recall Definition 0.1(c).

(a) We have the isomorphism

$$U(W_+) \cong \frac{\mathbb{k}\langle e_1, e_2 \rangle}{\langle [e_1, [e_1, [e_1, e_2]]] + 6[e_2, [e_2, e_1]], [e_1, [e_1, [e_1, [e_1, e_2]]]] + 40[e_2, [e_2, [e_2, e_1]]] \rangle}.$$  

(b) The set $\{e_{i_1}, e_{i_2}, \ldots, e_{i_k} \mid k \in \mathbb{N} \text{ and } 1 \leq i_1 \leq i_2 \leq \cdots \leq i_k \in \mathbb{N}\}$ forms a $\mathbb{k}$-vector space basis of $U(W_+)$.

**Proof.** Part (a) is [Sierra and Walton 2014, Lemma 1.1], and part (b) is clear from the definition of $U(W_+)$. \qed
Next, let us present some notation that we will use for the rest of the paper. We will work with the algebras $R$ and $S$ defined in Notation 0.2; note that we can view $R$ as a subalgebra of $S$. In addition:

**Notation 1.2** ($Q$). Take $Q$ to be the subalgebra of $S$ generated by $u$, $v$, and $vw$.

In our first result, we provide an easy way to multiply elements in $S$. Recall from [Zhang 1996] that a Zhang twist of a graded algebra $L$, by an automorphism $\mu$ of $L$, is the algebra $L^\mu$, where $L^\mu = L$ as graded vector spaces and $L^\mu$ has multiplication $\ell \ast \ell' = \ell(\ell')^{\mu i}$ for $\ell \in L_i$ and $\ell' \in L$.

Moreover, recall that an Artin–Schelter (AS-)regular algebra is a connected graded algebra $A$ of finite global dimension, of finite injective dimension $d$ with $\text{Ext}^i_A(A[k], A) \cong \text{Ext}^i_A(k, A) \cong \delta_{i,d}k$ (that is, $A$ is AS-Gorenstein), and has finite Gelfand–Kirillov dimension. These algebras are important in noncommutative ring theory because they are noncommutative analogues of polynomial rings and share many of their good properties.

**Lemma 1.3** ($\mu, v$). Let $\mu \in \text{Aut}(k[x, y, z])$ be defined by

$$
\mu(x) = x - y, \quad \mu(y) = y, \quad \mu(z) = z.
$$

Then $S$ is isomorphic to the Zhang twist $k[x, y, z]^\mu$. Further, $\mu$ restricts to an automorphism of $k[x, y, yz]$, which we also denote by $\mu$, and to an automorphism $v$ of $k[x, y]$. We have that $R \cong k[x, y]^\mu$ and $Q \cong k[x, y, yz]^\mu$ as graded $k$-algebras. As a consequence, $S$, $R$, and $Q$ are AS-regular algebras.

**Proof.** To see that $S \cong k[x, y, z]^\mu$, we emphasize that

1. the variables $u, v, w$ of $S$ have noncommutative multiplication,
2. the variables $x, y, z$ of $k[x, y, z]$ have commutative multiplication, and
3. the symbol $*$ denotes the noncommutative multiplication on $k[x, y, z]^\mu$ defined by $\ell \ast \ell' = \ell(\ell')^{\mu i}$ for $\ell \in k[x, y, z]_i$ and $\ell' \in k[x, y, z]$.

Now,

$$
\begin{align*}
y \ast x &= yx^\mu = y(x - y) = (x - y)y = xy - y^2 = xy^\mu - yy^\mu = x \ast y - y \ast y, \\
z \ast x &= zx^\mu = z(x - y) = (x - y)z = xz - yz = xz^\mu - yz^\mu = x \ast z - y \ast z, \\
z \ast y &= zy^\mu = zy = yz = yz^\mu = y \ast z.
\end{align*}
$$

Thus, if we identify $u, v, w$ with $x, y, z$, respectively, then the relations of $S$ hold in $k[x, y, z]^\mu$, and $S \cong k[x, y, z]^\mu$ as graded $k$-algebras.

That $\mu$ restricts to automorphisms of $k[x, y]$ and $k[x, y, yz]$ is immediate, and the other isomorphisms hold by a similar argument. Moreover, the last statement follows as commutative polynomial rings are AS-regular and this property is preserved under Zhang twisting by [Zhang 1996, Theorem 1.3(i)].
Now we verify that the algebra homomorphisms $\lambda_a$ and $\phi$ from Definition 0.3 are well defined.

**Lemma 1.5.** The maps $\phi$ and $\lambda_a$ of Definition 0.3 are well-defined homomorphisms of graded $\mathbb{k}$-algebras.

**Proof.** We check that $\phi$ respects the Witt relations given in Definition 0.1(b), by using Lemma 1.3 and (1.4):

$$
\phi(e_n e_m - e_m e_n)
= (u - (n-1)w)v^{n-1}(u-(m-1)w)v^{m-1} - (u-(m-1)w)v^{m-1}(u-(n-1)w)v^{n-1}
= (x-(n-1)z)(x-(m-1)z)^{\mu n} y^{n+m-2} - (x-(m-1)z)(x-(n-1)z)^{\mu m} y^{n+m-2}
= ((x-(n-1)z)(x-ny-(m-1)z) - (x-(m-1)z)(x-my-(n-1)z)) y^{n+m-2}
= (m-n)x y^{n+m-1} + (n(n-1)-m(m-1)) y^{n+m-1} z
= (m-n)(x-(n+m-1)z) y^{n+m-1}
= (m-n)(u-(n+m-1)w) y^{n+m-1}
= (m-n)\phi(e_{n+m}).$

So, the claim holds for $\phi$.

Similarly, we verify that $\lambda_a$ respects the Witt relations:

$$
\lambda_a(e_n e_m - e_m e_n) = (u - (n-1)a v)v^{n-1}(u-(m-1)a v)v^{m-1} - (u-(m-1)a v)v^{m-1}(u-(n-1)a v)v^{n-1}
= ((x-(n-1)a y)(x-ny-(m-1)a y) - (x-(m-1)a y)(x-my-(n-1)a y)) y^{n+m-2}
= (m-n)(x-a(n+m-1)y) y^{n+m-1}
= (m-n)(u-a(n+m-1)v) y^{n+m-1}
= (m-n)\lambda_a(e_{n+m}).$

Thus, the claim holds for $\lambda_a$. $\square$

Next, we define the key algebras $A(a)$ and $B$ that we will use throughout.

**Notation 1.6** ($A(a)$, $B$). Take $a \in \mathbb{k}$ and let $A(a)$ denote the subalgebra $\lambda_a(U(W_+))$ of $R$. Further, let $B$ denote the subalgebra $\phi(U(W_+))$ of $S$.

We point out a useful observation.

**Lemma 1.7.** We have that $B \subseteq Q$.

**Proof.** We get that $\phi(e_1) = u$ and $\phi(e_2) = (u-w)v = uv-vw$ are in $Q$. By Lemma 1.1(a), $B$ is generated by these elements, so we are done. $\square$
2. The kernel and image of the maps $\lambda_a$

The goal of this section is to analyze the maps $\lambda_a$ from Definition 0.3, which are well defined by Lemma 1.5. In particular, we verify Theorem 0.6(a,b).

To proceed, recall Notations 0.2 and 1.6. We first compute the factor rings $A(a)$, proving Theorem 0.6(b).

**Proposition 2.1.** We have that $A(0) = \kappa + uR$ (a right idealizer in $R$), that $A(1) = \kappa + Ru$ (a left idealizer in $R$), and that $A(a)_{-4} = R_{-4}$ if $a \neq 0, 1$. For all $a$, the ring $A(a)$ is noetherian.

**Proof.** Recall from Lemma 1.1(a) that $U(W_+)$ is generated by $e_1$ and $e_2$. We have that $\lambda_0(e_1) = u$ and $\lambda_0(e_2) = uv$. These elements generate $\kappa + uR$. Moreover, $\lambda_1(e_1) = u$ and $\lambda_1(e_2) = (u-v)v = vu$, and these elements generate $\kappa + Ru$. That the rings $A(0)$ and $A(1)$ are noetherian follows from [Stafford and Zhang 1994, Lemma 2.2(iii) and Theorem 2.3(i.a)].

When $a \neq 0, 1$, we must show that $R_{-4} \subseteq A(a)$. Since $uR_n + R_nu = R_{n+1}$ for $n \geq 1$ and since $\dim_{\kappa} R_4 = 5$, the proof boils down to showing that the set of elements

$$
\lambda_a(e_1^4), \lambda_a(e_1^2e_2), \lambda_a(e_1e_2e_1), \lambda_a(e_2e_1^2), \lambda_a(e_2^2)
$$

is $\kappa$-linearly independent for $a \neq 0, 1$. Using Lemma 1.3 and (1.4), consider the following calculations:

\begin{align*}
\lambda_a(e_1^4) &= u^4 = xx^\mu x^\mu^2 x^\mu^3 = x(x-y)(x-2y)(x-3y) =: r_1, \\
\lambda_a(e_1^2e_2) &= u^2(u-av)v = xx^\mu(x-ay)^\mu^2 y^\mu^3 = x(x-y)(x-(2+a)y)y =: r_2, \\
\lambda_a(e_1e_2e_1) &= u(u-av)vu = x(x-ay)^\mu y^\mu^2 x^\mu^3 = x(x-(1+a)y)y(x-3y) =: r_3, \\
\lambda_a(e_2e_1^2) &= (u-av)vu^2 = (x-ay)y^\mu x^\mu^2 x^\mu^3 = (x-ay)y(x-2y)(x-3y) =: r_4, \\
\lambda_a(e_2^2) &= (u-av)v(u-av)v = (x-ay)y\mu x^{\mu}(x-ay)\mu^2 y^\mu^3 \\
&= (x-ay)y(x-(2+a)y)y =: r_5.
\end{align*}

By direct computation, we see that $r_1, \ldots, r_5$ are linearly independent if $a \neq 0, 1$.

Further, since $A(a)$ and $R$ are equal in large degree and $R$ is noetherian, $A(a)$ is noetherian by [Stafford 1985, Lemma 1.4].

Next we compute the kernels of the maps $\lambda_a$ and establish Theorem 0.6(a). We will use the following notation:

**Notation 2.2** $(\pi, \pi_a, \pi_B)$. Let $\kappa \langle t_1, t_2 \rangle$ be the free algebra, which we grade by setting $\deg t_i = i$. We set the notation below:
• \( \pi : \mathbb{k}\langle t_1, t_2 \rangle \to U(W_+) \) is the algebra map given by \( \pi(t_1) = e_1 \) and \( \pi(t_2) = e_2 \).

• \( \pi_a : \mathbb{k}\langle t_1, t_2 \rangle \to R \) is the algebra map given by \( \pi_a(t_1) = \lambda_a(e_1) = u \) and \( \pi_a(t_2) = \lambda_a(e_2) = (u - av)v \), for \( a \in \mathbb{k} \). The image of \( \pi_a \) is \( A(a) \). Note that \( \pi_a = \lambda_a \circ \pi \).

• \( \pi_B : \mathbb{k}\langle t_1, t_2 \rangle \to S \) is the algebra map given by \( \pi_B(t_1) = \phi(e_1) = u \) and \( \pi_B(t_2) = \phi(e_2) = uv - vw \). The image of \( \pi_B \) is \( B \). Note that \( \pi_B = \phi \circ \pi \).

In the next result, we compute a presentation of the algebra \( A(0) \).

**Lemma 2.3.** The kernel of \( \pi_0 \) is generated by

\[
q := t_1^2 t_2 - t_2 t_1^2 - 2t_2^2,
q' := t_1^3 t_2 - 3t_1^2 t_2 t_1 + 3t_1 t_2^3 - t_2 t_1^3 + 6t_2^2 t_1 - 12t_2 t_1 t_2 + 6t_1 t_2^2
\]

as a two-sided ideal.

**Proof.** Let \( A = A(0) \), and consider the exact sequence of right \( A \)-modules

\[
0 \rightarrow K \rightarrow A[-1] \oplus A[-2]^{(u,v)} \rightarrow A \rightarrow \mathbb{k} \rightarrow 0.
\]

**Claim.** As a right \( A \)-module, \( K \) is generated by 

\[
(u^2v, -u(u+2v)) \quad \text{and} \quad (u^2v^2, -u(u+2v)v).
\]

Assume the claim. It is well known that one may deduce generators and relations of a connected graded \( \mathbb{k} \)-algebra from the first few terms in a minimal resolution of the trivial module \( \mathbb{k} \). The precise method is given in Proposition A.1 in the Appendix. Using the notation of that result, take

\[
b_1^1 = u^2v, \quad b_1^2 = -u(u+2v),
\]
\[
b_2^1 = u^2v^2, \quad b_2^2 = -u(u+2v)v.
\]

Moreover, take

\[
\tilde{b}_1^1 = t_1 t_2, \quad \tilde{b}_1^2 = t_1^2 t_2 - t_1 t_2 t_1, \quad \tilde{b}_2^2 = 2t_2 t_1 - 3t_1 t_2.
\]

Note that \( \pi_0(\tilde{b}_j^i) = b_j^i \) for \( i, j = 1, 2 \). Now we obtain by Proposition A.1 that

\[
q_1 := t_1(\tilde{b}_1^1) + t_2(\tilde{b}_2^1) = t_1^2 t_2 - t_2 t_1^2 - 2t_2^2,
q_2 := t_1(\tilde{b}_1^2) + t_2(\tilde{b}_2^2) = t_1^3 t_2 - t_1^2 t_2 t_1 + 2t_2^2 t_1 - 3t_2 t_1 t_2
\]

generate \( \ker \pi_0 \). Observe that \( q = q_1 \) and that

\[
q' - 4q_2 = -3t_1^3 t_2 + t_1^2 t_2 t_1 + 3t_1 t_2 t_1^3 - 2t_2 t_1^3 - 2t_2^2 t_1 + 6t_1 t_2^2 = -3t_1 q + qt_1 \in (q).
\]

Thus, \( \ker \pi_0 \) is generated by \( q \) and \( q' \), as desired.
So it remains to prove the claim.

Proof of claim. Note that there is an isomorphism of graded right $A$-modules $\beta : uA \cap uvA \to K$ given by $\beta(r) = (u^{-1}r, -(uv)^{-1}r)$.

Take $M := A \cap vA$. Since $A = k + uR$, it is easy to show that $M = uR \cap vuR$, and in particular, that $M$ is a right $R$-module. Since $(uR + vuR)_{\geq 2} = R_{\geq 2}$, we get that

$$\dim_k M_n = \dim_k R_{n-1} + \dim_k R_{n-2} - \dim_k R_n = n - 2$$

for $n \geq 2$, and $\dim_k M_n = 0$ for $n < 2$. Moreover, $u^2v = vu(u + 2v) \in M$, so $u^2vR \subseteq M$ and $\text{hilb}(u^2vR) = \text{hilb} M$. So, $M = u^2vR$. Now

$$uA \cap uvA = uM = u^3vR = u^3vA + u^3v^2A = uvu(u + 2v)A + uu(u + 2v)vA,$$

where the equality (*) holds as $R = A + vA$. Apply the map $\beta$ to the right-hand side of the equation above to yield the desired result. \qed

We can now understand $\ker \lambda_0$ and $\ker \lambda_1$. We first prove:

Lemma 2.4. We have $\ker \lambda_0 = \ker \lambda_1$.

Proof. Working in the quotient division ring of $R$, we have

$$u^{-1}\lambda_0(e_n)u = v^{n-1}u = \lambda_1(e_n).$$

So for any $f \in U(W_+)$, we have $\lambda_1(f) = u^{-1}\lambda_0(f)u$. The result follows. \qed

Proposition 2.5. We have that $\ker \lambda_a = (e_1e_3 - e_2^2 - e_4)$ for $a = 0, 1$.

Proof. We first check that $e_1e_3 - e_2^2 - e_4$ is indeed in $\ker \lambda_0$:

$$
\lambda_0(e_1e_3 - e_2^2 - e_4) = u(uv^2) - (uv)(uv) - uv^3 = u^2v^2 - u(uv - v^2)v - uv^3 = 0.
$$

Recall that $\pi_0 = \lambda_0 \circ \pi$. So, Lemma 2.3 implies that $\ker \lambda_0 = \pi(\ker \pi_0)$ is generated by elements $\pi(q)$ and $\pi(q')$ in $U(W_+)$. Now $\pi(q') = 0$ by Lemma 1.1(a), so $\ker \lambda_0$ is generated by $\pi(q)$. Moreover,

$$\pi(q) = e_1^2e_2 - e_2e_1^2 - 2e_2^2$$

$$= 2(e_1(e_1e_2 - e_2e_1) - e_2^2 - (\frac{1}{2}e_1^2e_2 - e_1e_2e_1 + \frac{1}{2}e_2e_1^2)) = 2(e_1e_3 - e_2^2 - e_4),$$

using the relation $[e_n, e_m] = (m-n)e_{n+m}$ in $U(W_+)$. Thus, $\ker \lambda_0 = (e_1e_3 - e_2^2 - e_4)$, as claimed.

The result for $a = 1$ now follows by Lemma 2.4. \qed

It remains to analyze $\ker \lambda_a$ with $a \neq 0, 1$. We do this in the next two results.
Lemma 2.6. For $a \neq 0, 1$, the kernel of $\lambda_a$ is generated in degrees 5 and 6.

Proof. Take $A' := A(a)$. It suffices to show that the kernel of $\pi_a$ is generated in degrees 5 and 6. Consider the exact sequence of right $A'$-modules

$$0 \longrightarrow K \longrightarrow A'[-1] \oplus A'[-2] \overset{(u,(u-av)v)}{\longrightarrow} A' \longrightarrow \mathbb{k} \longrightarrow 0.$$

We have that $uA' \cap (u - av)vA' \cong K$ as right $A'$-modules. As in the proof of Lemma 2.3, it now suffices to show that $uA' \cap (u - av)vA'$ is generated in degrees 5 and 6 as a right $A'$-module.

Let $J := uA' \cap (u - av)vA'$, and let $L := uR \cap (u - av)vR$. Note that $J \subseteq L$. Since $a \neq 0$, we get that $R_{\geq 2} = (uR + (u - av)vR)_{\geq 2}$. So,

$$\dim_k L_n = \dim_k R_{n-1} + \dim_k R_{n-2} - \dim_k R_n = n - 2$$

for $n \geq 2$. So, $\dim_k L_3 = 1$, and is principally generated as a right $R$-module by an element of degree 3. In fact,

$$(2.7) \quad L = rR, \quad \text{where } r := u(uv + (1 - a)v^2) = (uv - av^2)(u + 2v).$$

Since $A'_{\geq 4} = R_{\geq 4}$ by Proposition 2.1, we have $J_{\geq 6} = L_{\geq 6}$. By direct computation, one obtains that $J_i = 0$ for $i = 0, \ldots, 4$; one can also use Routine A.2 in the Appendix.

Let $J' = J_5A' + J_6A'$. We prove by induction that $J_n = J_n'$, for all $n \geq 5$. The statement is clear for $n = 5, 6$. For $n = 7$, we make the following assertion, the proof of which is presented in the Appendix; see Claim A.3.

Claim. We have that $J_5A'_2 \not\subseteq J_6A'_1$.

So for $n \geq 6$, we have $J_n = L_n = rR_{n-3}$. So $\dim_k J_7 = 5$, and $\dim_k J_6A'_1 = \dim_k J_6 = 4$. With the claim, we obtain $J_7 = J_5A'_2 + J_6A'_1$. Thus, $J_7 = J'_7$. Now for the induction step, suppose we have established that $J'_n = J_n$ and $J'_{n-1} = J_{n-1}$ for some $n \geq 7$. Then

$$J_{n+1} \supseteq J'_{n+1} = J'_{n+1}u + J'_{n-1}(u - av)v = J_{n+1}u + J_{n-1}(u - av)v = r(R_{n-3}u + R_{n-4}(u - av)v) = rR_{n-2} = J_{n+1}.$$

The penultimate equality holds as $a \neq 1$. Thus, the lemma is verified. \qed

Proposition 2.8. If $a \neq 0, 1$, then $\ker \lambda_a$ is the ideal generated by the elements

\[ h_1 := e_1e_2^2 - e_1^2e_3 - (2a)e_2e_3 + (1 + 2a)e_1e_4 - (a^2 + a)e_5, \]
\[ h_2 := e_1e_5 - 4e_2e_4 + 3e_3^2 + 2e_6, \]
\[ h_3 := -4e_1^2e_2^2 - 4e_2^3 + 4e_1^3e_3 + (20a^2 + 14a - 7)e_3^2 - (16a^2 + 18a + 5)e_1e_5 + (16a^3 + 36a^2 + 16a - 2)e_6. \]
**Proof.** By Lemma 2.6, we just need to produce linearly independent elements of \( \ker \lambda_a \) in degrees 5 and 6. We have by Routine A.2 that \( \dim_k(\ker \lambda_a)_5 = 1 \) and that we can choose a basis of \( (\ker \lambda_a)_5 \) to be the element \( h_1 \). In fact, we verify that 
\[
\lambda_a(h_1) = 0
\]
using Lemma 1.3 and (1.4), while suppressing some \( \mu \) superscripts:
\[
\lambda_a(h_1) = u(u - av)v(u - av)v - u^2(u - 2av)v^2 - (2a)(u - av)v(u - 2av)v^2 \\
+ (1 + 2a)u(u - 3av)v^3 - (a^2 + a)(u - 4av)v^4
\]
\[
= x(x - ay)\mu^3 y(x - ay)y - x\mu (x - 2ay)\mu^2 y^2
\]
\[
- (2a)(x - ay)y(x - 2ay)\mu y^2
\]
\[
+ (1 + 2a)x(x - 3ay)\mu^3 y^3 - (a^2 + a)(x - 4ay)y^4
\]
\[
= x(x - (1 + a)y)y(x - (3 + a)y)y - x(x - y)(x - (2 + 2a)y)y^2
\]
\[
- (2a)(x - ay)y(x - (2 + 2a)y)y^2
\]
\[
+ (1 + 2a)x(x - (1 + 3a)y)y^3 - (a^2 + a)(x - 4ay)y^4
\]
\[
= 0.
\]

On the other hand, we have by Routine A.2 that \( \dim_k(\ker \lambda_a)_6 = 4 \) and that we can take a basis of \( (\ker \lambda_a)_6 \) to be \( h_2, h_3 \) along with
\[
h_4 := 4e_2^3 - 4e_1 e_2 e_3 + (7 - 4a)e_3^2 + (1 + 4a)e_1 e_5 + (2 - 4a - 4a^2)e_6,
\]
\[
h_5 := 4e_2^3 + (7 - 14a)e_3^2 - 4e_1^2 e_4 + (5 + 14a)e_1 e_5 + (2 - 16a - 12a^2)e_6.
\]

By direct computation we have
\[
e_1 h_1 = e_1^2 e_2^2 - e_1^3 e_3 - (2a)e_1 e_2 e_3 + (1 + 2a)e_1^2 e_4 - (a^2 + a)e_1 e_5,
\]
\[
h_1 e_1 = e_1 e_2^2 e_1 - e_1^2 e_3 e_1 - (2a)e_2 e_3 e_1 + (1 + 2a)e_1 e_4 e_1 - (a^2 + a)e_1 e_5
\]
\[
= e_1^2 e_2^2 - e_1^3 e_3 - (2 + 2a)e_1 e_2 e_3 + (2a)e_3^2 + (3 + 2a)e_1^2 e_4 + (4a)e_2 e_4
\]
\[
- (2 + 7a + a^2)e_1 e_5 + 4(a^2 + a)e_6.
\]

**Claim.** We have that \( h_2, h_3, e_1 h_1, h_1 e_1 \) are \( \mathbb{k} \)-linearly independent and that
\[
h_4 = 2a(2a + 1)h_2 - h_3 - (6 + 4a)e_1 h_1 + (2 + 4a)h_1 e_1,
\]
\[
h_5 = 4a^2 h_2 - h_3 - (4 + 4a)e_1 h_1 + (4a)h_1 e_1.
\]

The proof is presented in the Appendix; see Claim A.5. Thus, the result holds.

Now for the reader’s convenience, we verify that \( \lambda_a(h_i) = 0 \) for \( i = 2, 3 \) using Lemma 1.3 and (1.4), while suppressing some \( \mu \) superscripts:
\[
\lambda_a(h_2) = u(u - 4av)v^4 - 4(u - av)v(u - 3av)v^3 \\
+ 3(u - 2av)v^2(u - 2av)v^2 + 2(u - 5av)v^5
\]
\[
= x(x - 4ay)^\mu y^4 - 4(x - ay)y(x - 3ay)^\mu y^3 \\
+ 3(x - 2ay)^2(x - 2ay)^\mu y^2 + 2(x - 5ay)y^5
\]
\[
= x(x - (1 + 4a)y)y^4 - 4(x - ay)y(x - (2 + 3a)y)y^3 \\
+ 3(x - 2ay)y^2(x - (3 + 2a)y)y^2 + 2(x - 5ay)y^5 \\
= 0,
\]
\[
\lambda_a(h_3) = -4u^2(u-av)v(u-av)v - 4(u-av)v(u-av)v + 4u^3(u-2av)v^2 \\
+ (20a^2 + 14a - 7)(u-2av)v^2(u-2av)v^2 \\
- (16a^2 + 18a + 5)u(u-4av)v^4 \\
+ (16a^3 + 36a^2 + 16a - 2)(u-5av)v^5 \\
= -4xx^\mu(x-ay)^{\mu^2}y(x-ay)^{\mu^4}y \\
- 4(x-ay)y(x-ay)^{\mu^2}y(x-ay)^{\mu^4}y + 4xx^\mu x^{\mu^2}(x-2ay)^{\mu^3}y^2 \\
+ (20a^2 + 14a - 7)(x-2ay)y^2(x-2ay)^{\mu^3}y^2 \\
- (16a^2 + 18a + 5)x(x-4ay)^{\mu^4}y^4 \\
+ (16a^3 + 36a^2 + 16a - 2)(x-5ay)y^5 \\
= -4(x-y)(x-(2+a)y)y(x-(4+a)y)y \\
- 4(x-ay)y(x-(2+a)y)y(x-(4+a)y)y \\
+ 4x(x-y)(x-2y)(x-(3+2a)y)y^2 \\
+ (20a^2 + 14a - 7)(x-2ay)y^2(x-(3+2a)y)y^2 \\
- (16a^2 + 18a + 5)x(x-(1+4a)y)y^4 \\
+ (16a^3 + 36a^2 + 16a - 2)(x-5ay)y^5 \\
= 0. \quad \Box
\]

3. Elementary proofs that \(U(W_+)\) and \(U(W)\) are not noetherian

In this section, we establish the remaining part of Theorem 0.7, that \(\ker \lambda_0 = \ker \lambda_1\) is not finitely generated as a left or right ideal of \(U(W_+)\). We also prove Theorem 0.8.

We first focus on \(U(W_+)\). Recall the map \(\phi : U(W_+) \to B\) from Definition 0.3, and consider Notations 0.2, 1.2, 1.6, and 2.2 along with the following.

Notation 3.1 \((p, I)\). Let \(p := \phi(e_1 e_3 - e_2^2 - e_4)\) be an element of \(B\), and let \(I := (p)\) be a two-sided ideal of \(B\). Note that by Proposition 2.5, \(I = \phi(\ker \lambda_0) = \pi_B(\ker \pi_0)\).

We begin by establishing some basic facts about \(p\) and \(I\).

Lemma 3.2.

(a) \(p = v^3w - v^2w^2\).

(b) \(p\) is a normal element of \(S\) and of \(Q\).

(c) \(I = Qp\).
Proof. We employ Lemma 1.3 and (1.4) in all parts.

(a) Consider the computation in $S$ below:
\[
p = \phi(e_1 e_3 - e_2^2 - e_4)
= u(u - 2w)v^2 - (u - w)v(u - w)v - (u - 3w)v^3
= x(x - 2z)\mu y\mu^2 y\mu^3 - (x - z)y\mu(x - z)\mu^2 y\mu^3 - (x - 3z)y\mu y\mu^2 y\mu^3
= x(x - y - 2z)y^2 - (x - z)y(x - 2y - z)y - (x - 3z)y^3
= y^3z - y^2z^2
= v^3w - v^2w^2.
\]

(b) From part (a), we get that $p$ is a normal element of $S$, and of $Q$, since $vp = pv$, $wp = pw$, and
\[
up = u(v^3w - v^2w^2) = xy\mu y\mu^2 y\mu^3 z\mu^4 - xy\mu y\mu^2 z\mu^3 z\mu^4 = (y^3z - y^2z^2)x
= (y^3z - y^2z^2)(x + 4y)\mu^4 = (v^3w - v^2w^2)(u + 4v) = p(u + 4v).
\]

(c) On one hand, we get that $I = BpB \subseteq QpQ = Qp$, by Lemma 1.7 and part (b).
On the other hand, recall that $R$ is the subalgebra of $Q$ generated by $u, v$. We will show by induction on $i$ and $j$ that $p(vw)^i R_{j - 2i} \subseteq I$ for all $0 \leq i \leq \lfloor \frac{1}{2}j \rfloor$; this yields $pQ_j \subseteq I$.

The base case $i = j = 0$ holds since $p \in I$. For the induction step, assume that $p(vw)^i R_{j - 2i} \subseteq I$. Now it suffices to show that (i) $p(vw)^i R_{j + 1 - 2i} \subseteq I$ and (ii) $p(vw)^{i+1} R_{j - 2i} \subseteq I$.

For (i), we have by induction that
\[
I \supseteq up(vw)^i R_{j - 2i} + p(vw)^i R_{j - 2i} u =: I',
\]
since $u$ is a generator of $B$. Now consider the following computations, where we suppress the action of $\mu$ on invariant elements and on graded pieces of $\mathbb{k}[x, y]$:
\[
I' = x(y^3z - y^2z^2)(yz)^i \mathbb{k}[x, y]_{j - 2i} + (y^3z - y^2z^2)(yz)^i \mathbb{k}[x, y]_{j - 2i} x\mu^j
= (y^3z - y^2z^2)(yz)^i x\mathbb{k}[x, y]_{j - 2i} + (y^3z - y^2z^2)(yz)^i (x + (j + 4)y) \mathbb{k}[x, y]_{j - 2i}
= (y^3z - y^2z^2)(yz)^i (x\mathbb{k}[x, y]_{j - 2i} + (x + (j + 4)y) \mathbb{k}[x, y]_{j - 2i})
= (y^3z - y^2z^2)(yz)^i \mathbb{k}[x, y]_{j + 1 - 2i},
\]
where the last equality holds since $j + 4 > 0$. Thus (i) holds.

For (ii), we get that $p(vw)^i R_{j + 2 - 2i} \subseteq I$ by applying (i) twice. Now
\[
I \supseteq p(vw)^i R_{j + 2 - 2i} + p(vw)^i R_{j - 2i} (uv - vw) \supseteq p(vw)^i R_{j - 2i} (vw).
\]
Note that $R_k(vw) = (vw)R_k$ for all $k$. So $I \supseteq p(vw)^{i+1} R_{j - 2i}$ and we are done. \(\square\)
Now we complete the proof of Theorem 0.7.

**Theorem 3.3.** The ideal \( I \) of \( B \) is not finitely generated as a left or right ideal. As a result, the kernel of \( \lambda_0 \) is not finitely generated as a left or right ideal of \( U(W+) \).

**Proof.** Recall that ker \( \lambda_0 = (e_1e_3 - e_2^2 - e_4) \) by Proposition 2.5. It is clear that if ker \( \lambda_0 \) is finitely generated as a left/right ideal of \( U(W+) \), then \( I \) is finitely generated as a left/right ideal of \( B \). Therefore, to show that ker \( \lambda_0 \) is not finitely generated it suffices to show that \( BI \) and \( IB \) are not finitely generated.

By way of contradiction, suppose that \( BI \) is finitely generated. Then there exists \( n \geq 4 \) such that \( BI \leq_n = I \). Since \( B \) is generated by \( u \) and \( (u - w)v \), we get that

\[
I_{n+1} = B_1I_n + B_2I_{n-1} = uI_n + (u - w)vI_{n-1}.
\]

By Lemma 3.2, \( I = Qp \subseteq SpS = Sp \). Since \( vI \subseteq vSp \subseteq Sp \), we get by (3.4) that

\[
I_{n+1} \subseteq uSp + (u - w)Sp = uSp + wSp.
\]

Using Lemma 1.3 and (1.4), it is easy to see that \( uS + wS = x\mathbb{k}[x, y, z] + z\mathbb{k}[x, y, z] \) and that a positive power of \( y \) cannot belong to the right-hand side. So, a positive power of \( v \) cannot belong to \( uS + wS \). Therefore,

\[
v^{n-3}p \notin uSp + wSp.
\]

On the other hand, \( v^{n-3}p \in I_{n+1} \) by Lemma 3.2(c). This contradicts (3.5) and (3.6). Thus, \( BI \) is not finitely generated.

Next, suppose that \( IB \) is finitely generated. Then there exists \( n \geq 4 \) such that \( I_{n}B = I \), with

\[
I_{n+1} = I_nB_1 + I_{n-1}B_2 = I_nu + I_{n-1}(u - w)v = I_nu + I_{n-1}v(u + v - w).
\]

We get that \( I, Iv \subseteq pS \) by Lemma 3.2(b). So, the right-hand side of (3.7) is contained in \( pS + pS(v - w) \). With an argument similar to that in the previous paragraph, we obtain that \( Su + S(v - w) \) does not contain positive powers of \( v \). So, \( pv^{n-3} \notin I_nu + I_{n-1}v(u + v - w) \). On the other hand, \( pv^{n-3} \in I_{n+1} \) by Lemma 3.2(b,c), which contradicts (3.7). Thus, \( IB \) is not finitely generated.

**Remark 3.8.** We do not know whether or not ker \( \lambda_0 \) is finitely generated for \( a \neq 0, 1 \).

One can of course deduce from Theorem 3.3 that \( U(W) \) and \( U(V) \) are neither left nor right noetherian; see [Sierra and Walton 2014, Lemma 1.7]. Nevertheless, a direct proof that \( U(W) \) is not left or right noetherian is of independent interest, and we give such a result to end the section. First, we establish some notation.

**Notation 3.9** (\( \hat{S}, \hat{R}, \hat{B}, \hat{\phi}, \hat{\lambda}_a, \eta_a, \hat{I} \)). Since \( v \) is normal in \( S \) and in \( R \), we may invert it. Let \( \hat{S} := S[v^{-1}] \), and let \( \hat{R} := R[v^{-1}] \).
Note that $\phi$ extends to an algebra homomorphism $\hat{\phi} : U(W) \to \hat{S}$ defined by (0.4) for all $n \in \mathbb{Z}$. Likewise, $\lambda_a$ extends to an algebra homomorphism $\hat{\lambda}_a : U(W) \to \hat{R}$ defined by (0.5) for all $n \in \mathbb{Z}$. For $a \in \mathbb{k}$ define $\eta_a : \hat{S} \to \hat{R}$ by $u \mapsto u, v \mapsto v, w \mapsto a v$. Note that $\hat{\lambda}_a = \eta_a \hat{\phi}$.

Let $\hat{B} := \hat{\phi}(U(W))$. Finally, let $\hat{I} = \hat{\phi}(\ker \hat{\lambda}_0)$. Note that $\hat{I} = \hat{B} \cap \ker \eta_0$.

We first note that the proof of Lemma 2.4 extends to $U(W)$ to give

$$\ker \hat{\lambda}_0 = \ker \hat{\lambda}_1. \tag{3.10}$$

**Proposition 3.11.** Recall $p = \phi(e_1 e_3 - e_2^2 - e_4) = w(v - w)v^2$ from Notation 3.1 and Lemma 3.2. We have

$$\hat{I} = \hat{B} \cap \ker \eta_0 = \hat{B} \cap \ker \eta_1 = \hat{B} p \hat{B} = \hat{S} p = p \hat{S}. \tag{3.11}$$

**Proof.** We first show that $\hat{B} p \hat{B} = \hat{S} p = p \hat{S}$. Certainly, $\hat{B} p \hat{B} \subseteq \hat{S} p \hat{S} = \hat{S} p = p \hat{S}$, where the last two equalities hold because a normal element of $S$ will also be normal in $\hat{S}$.

For the other direction, we will show $\hat{R} w^j p \subseteq \hat{B} p \hat{B}$ for all $j \geq 0$ by induction. Since $\hat{S} = \hat{R} \cdot \mathbb{k}[w]$, this will imply $\hat{S} p \subseteq \hat{B} p \hat{B}$. So assume $w^j p \in \hat{B} p \hat{B}$ for some $j \geq 0$ (it is clear for $j = 0$). Since $up = p(u + 4v)$, we get that for all $n \in \mathbb{Z}$,

$$\hat{B} p \hat{B} \ni [\hat{\phi}(e_n), w^j p] = (u - (n - 1)w)v^{n-1}w^jp - w^j p(u - (n - 1)w)v^{n-1} = (j + 4)v^n w^j p.$$

So, $\mathbb{k}[v, v^{-1}] \cdot w^j p \subseteq \hat{B} p \hat{B}$. Since $u = \hat{\phi}(e_1) \in \hat{B}$, we have

$$\hat{R} w^j p = \mathbb{k}[u] \cdot \mathbb{k}[v, v^{-1}] \cdot w^j p \subseteq \hat{B} p \hat{B}.$$

Finally, since we have seen that $v^{-1} w^j p \in \hat{R} w^j p \subseteq \hat{B} p \hat{B}$, we have that

$$\hat{B} p \hat{B} \ni (\hat{\phi}(e_1) - \hat{\phi}(e_2)v^{-1}) w^j p = w^{j+1} p.$$

By induction, $\hat{B} p \hat{B} = \hat{S} p$, as desired.

From the definitions, $p \in (\ker \eta_0) \cap (\ker \eta_1)$. So

$$\hat{B} p \hat{B} \subseteq (\ker \eta_0) \cap (\ker \eta_1) \cap \hat{B} = w \hat{S} \cap (v - w) \hat{S} = w(v - w) \hat{S} = p \hat{S}.$$

Combining this with the first part of the proof, $\hat{B} p \hat{B} = (\ker \eta_0) \cap (\ker \eta_1) \cap \hat{B}$. Then by (3.10) and the definition of $\hat{I}$, we have

$$\hat{I} = (\ker \eta_0) \cap \hat{B} = \hat{\phi}(\ker \hat{\lambda}_0) = \hat{\phi}(\ker \hat{\lambda}_1) = (\ker \eta_1) \cap \hat{B},$$

completing the proof.

From Proposition 3.11 we obtain:

**Theorem 3.12.** The ideal $\hat{I}$ of $\hat{B}$ is not finitely generated as a left or right ideal. As a result, the kernel of $\hat{\lambda}_0$ is not finitely generated as a left or right ideal of $U(W)$.
Proof. This argument is similar to the proof of Theorem 3.3. It suffices to show that $\hat{I}$ is not finitely generated as a left or right ideal of $\hat{B}$.

By way of contradiction, suppose we have $\hat{I} = \hat{B}(\hat{I}_n \oplus \cdots \oplus \hat{I}_n)$ for some $n \in \mathbb{N}$. For all $k \in \mathbb{Z}$, we have $\hat{\phi}(e_k) \in u \hat{S} + w \hat{S}$. So, $\hat{B}_k \subseteq u \hat{S} + w \hat{S}$ for all $k \neq 0$, and $\hat{I}_k \subseteq u \hat{S} + w \hat{S}$ for all $k$ with $|k| > n$. Note that a power of $v$ cannot belong to $u \hat{S} + w \hat{S}$. So, $v^{n-3} p \notin \hat{I}$. However, by Proposition 3.11, we get that $\hat{I} = \hat{S} p$ and $v^{n-3} p \in \hat{I}$. This contradiction shows that $\hat{B} \hat{I}$ is not finitely generated.

The proof that $\hat{I} \hat{B}$ is not finitely generated is similar; we leave the details to the reader. □

Corollary 3.13. The universal enveloping algebra $U(V)$ is neither left nor right noetherian.

Proof. This follows directly from Theorem 3.12, since $U(W) = U(V)/(c)$. □

Remark 3.14. After the first draft of this paper was finished, we learned of the results of Conley and Martin [2007]. We thank the referee for calling that work to our attention. The paper considers a family of homomorphisms defined as (using their notation)

$$\pi_y : U(W) \to k[x, x^{-1}, \partial], \quad e_n \mapsto x^{n+1} \partial + (n+1)yx^n.$$  

Using the identification $u = x^2 \partial$, $v = x$ from the discussion after Theorem 0.7, we have

$$\hat{\lambda}_a(e_n) = (x^2 \partial - (n-1)ax)x^{n-1} = x^{n+1} \partial + (1-a)(n-1)x^n.$$  

The reader may verify that

$$\hat{\lambda}_a(e) = x^{2(1-a)}\pi_{1-a}(e)x^{-2(1-a)}$$

for all $e \in U(W)$ (where here one uses a suitable extension of $k[x, x^{-1}, \partial]$ to carry out computations). As a result,

$$\ker \hat{\lambda}_a = \ker \pi_{1-a}$$

for all $a \in k$.

Conley and Martin [2007, Theorem 1.2] showed (using (3.15)) that

$$\ker \hat{\lambda}_0 = \ker \hat{\lambda}_1 = (e_1 e_2 - e_0 e_1 - e_1).$$

Recall from Proposition 2.5 that $\ker \lambda_0$ is generated as a two-sided ideal by $g_4 := e_1 e_3 - e_2^2 - e_4$. A computation gives that

$$\text{ad}(e_3^{-1})(g_4) = [e_1, [e_1, [e_1, g_4]]] = 12(e_1 e_2 - e_0 e_1 - e_1),$$

and it follows that

$$g_4 = \ker \hat{\lambda}_0 = \ker \hat{\lambda}_1 = (e_1 e_2 - e_0 e_1 - e_1).$$
4. The connection between the maps $\phi$ and $\rho$

For the remainder of the paper, we return to considering $U(W_+)$. The main goal of this section is to relate the map $\phi$ (of Definition 0.3) that played a crucial role in the proof of Theorem 3.3 to the map $\rho$ (of Notation 0.9) that was the focus of [Sierra and Walton 2014]. We show that $\ker \phi = \ker \rho$; in fact, we have the next result.

**Theorem 4.1.** We have that $\ker \rho = \ker \phi = \bigcap_{a \in k} \ker \lambda_a$. As a consequence, $\rho(U(W_+)) \cong \phi(U(W_+))$.

Consider Notation 0.2 and the following notation for this section. Recall the definitions of $X; f, \tau$ from Notation 0.9. So, $\tau \in \text{Aut}(X)$ and $\tau^* : k(X) \to k(X)$ is the pullback of $\tau$. Here we take $\mu \in \text{Aut}(\mathbb{P}^2)$ and $\nu \in \text{Aut}(\mathbb{P}^1)$ to be morphisms of varieties, defined by

$$
\mu([x : y : z]) = [x - y : y : z] \quad \text{and} \quad \nu([x : y]) = [x - y : y].
$$

We denote the respective pullback morphisms by $\mu^*$ and $\nu^*$. However, to be consistent with Lemma 1.3 (and abusing notation slightly), we still write

$$
S \cong k[x, y, z]^\mu \quad \text{and} \quad R \cong k[x, y]^\nu.
$$

We also establish the convention that $h^\tau := \tau^* h$ for $h \in k(X)$, and similarly for pullback by other morphisms.

Before proving Theorem 4.1, we provide some preliminary results.

**Lemma 4.2 ($\psi_a, \Psi_a$).** For $a \in k$, we have the following statements.

(a) We have a well-defined morphism $\psi_a : \mathbb{P}^1 \to X$ given by

$$
\psi_a([x : y]) = [2x^2 - 4xy - 6ay^2 : x^2 - 2xy + y^2 : -x^2 + 3xy - 2y^2 : x^2 - 4xy + 4y^2].
$$

(b) $\psi_a \nu = \tau \psi_a$.

(c) $\psi_a^*$ extends to an algebra homomorphism $\Psi_a : k(X)[t; \tau^*] \to k(\mathbb{P}^1)[s; \nu^*]$, where $\Psi_a(t) = s$.

**Proof.** (a,b) Both are straightforward. Part (a) is a direct computation. On page 508 in the Appendix, we verify that $(\psi_a \nu)^* = \nu^* \psi_a^* = \psi_a^* \tau^* = (\tau \psi_a)^*$ as maps from $k(X) \to k(\mathbb{P}^1)$. Thus, (b) holds.

(c) We have for all $h, \ell \in k(X)$ and $n, m \in \mathbb{N}$ that

$$
\Psi_a(ht^n \ell t^m) = \Psi_a(h \ell t^n t^{n+m}) = \psi_a^*(h) \psi_a^*(\ell) s^{n+m} = \psi_a^*(h) s^n \psi_a^*(\ell) s^m = \Psi_a(ht^n) \Psi_a(\ell t^m).
$$

Thus, $\Psi_a$ is an algebra homomorphism. \qed
Lemma 4.3 ($C_a$). For $a \in \mathbb{k}$, define the curve

$$C_a = V(w + 6ax + (4 + 12a)y + (2 + 6a)z, xz - y^2) \subseteq X.$$ 

Then $\psi_a$ defines an isomorphism from $\mathbb{P}^1 \to C_a$.

Proof. That the image of $\psi_a$ of Lemma 4.2(a) is contained in $C_a$ is a straightforward verification. The inverse map to $\psi_a$ is defined by the birational map $[w : x : y : z] \mapsto [2x + y : x + y]$; we leave the verification of the details to the reader. □

Lemma 4.4 ($\gamma$). Define a map $\gamma : R \to \mathbb{k}([\mathbb{P}^1]; [s; v^*])$ as follows: if $h \in R_n = \mathbb{k}[x, y]_n$, let

$$\gamma(h) = \frac{h}{x(x-y) \cdots (x-(n-1)y)} s^n.$$ 

Then $\gamma$ is an injective $\mathbb{k}$-algebra homomorphism.

Proof. Let $h \in \mathbb{k}[x, y]_n$ and $\ell \in \mathbb{k}[x, y]_m$. Then

$$\gamma(h \ast \ell) = \frac{h \ell s^n}{x(x-y) \cdots (x-(n+m-1)y)} = \frac{h}{x(x-y) \cdots (x-(n-1)y)} \left( \frac{\ell}{x(x-y) \cdots (x-(m-1)y)} \right) s^{m+n} = \gamma(h) \gamma(\ell).$$

So, $\gamma$ is a homomorphism; injectivity is clear. □

Proposition 4.5. Retain the notation of Lemmas 4.2 and 4.4. Let $a \in \mathbb{k}$. Then $\Psi_a \rho = \gamma \lambda_a$ as maps from $U(W_+) \to \mathbb{k}([\mathbb{P}^1]; [s; v^*])$, and $\ker \Psi_a \rho = \ker \lambda_a$.

Proof. By Lemma 1.1(a), it suffices to verify that the maps $\Psi_a \rho$ and $\gamma \lambda_a$ agree on $e_1$ and $e_2$. We have

$$\Psi_a(\rho(e_1)) = \Psi_a(t) = s = \gamma(u) = \gamma(\lambda_a(e_1)).$$

We verify that

$$(4.6) \hspace{1cm} \psi_a^*(f) = \frac{xy - ay^2}{x^2 - xy}$$

on page 508 in the Appendix. Thus,

$$\Psi_a(\rho(e_2)) = \psi_a^*(f) s^2 = \frac{xy - ay^2}{x^2 - xy} s^2 = \gamma(uv - av^2) = \gamma \lambda_a(e_2).$$

The final statement follows from the fact that $\gamma$ is injective (Lemma 4.4). □
Proof of Theorem 4.1. By Lemma 4.3, $\psi^*_a h = 0$ if and only if $h|_{C_a} \equiv 0$. Now, the curves $C_a$ cover an open subset of $X$. (One way to see this is that, because $\bigcup_a C_a$ is dense in $X$ and is clearly constructible, by [Hartshorne 1977, Exercise II.3.19(b)] it contains an open subset of $X$.) Thus if $h \in \mathbb{k}(X)$ is in the intersection $\bigcap_a \ker \psi^*_a$, then $h$ vanishes on this open subset and so $h = 0$. So, $\bigcap_a \ker \Psi_a = \{0\}$. Thus, $\ker \rho = \bigcap_a \ker \Psi_a \rho = \bigcap_a \ker \lambda_a$, where the last equality holds by Proposition 4.5.

To show that $\ker \phi = \bigcap_a \ker \lambda_a$, define closed immersions $i_a : \mathbb{P}^1 \to \mathbb{P}^2$ for $a \in \mathbb{k}$ by $i_a([x : y]) = [x : y : ay]$. Then $\text{im}(i_a) = V(z - ay)$, and pullback along $i_a$ induces the ring homomorphism

$$i^*_a : \mathbb{k}[x, y, z] \to \mathbb{k}[x, y], \quad x \mapsto x, \quad y \mapsto y, \quad z \mapsto ay.$$ 

The reader may verify that $i_v \equiv \mu i_a$, and that $i^*_a$ is also a homomorphism from $S = \mathbb{k}[x, y, z]^{\mu}$ to $R = \mathbb{k}[x, y]^v$. In terms of $u, v, w$, we have

$$i^*_a(u) = u, \quad i^*_a(v) = v, \quad i^*_a(w) = av.$$ 

That is, $i^*_a = \eta_v i_a|_S$, where $\eta_v$ was defined in Notation 3.9. We see that $i^*_a \phi = \lambda_a$.

As with the first paragraph, the curves $V(z - ay)$ cover an open subset of $\mathbb{P}^2$: in fact, $\bigcup_a V(z - ay) \supseteq (\mathbb{P}^2 \setminus V(y))$. So $\bigcap_a \ker i^*_a = \{0\}$. Thus, $\ker \phi = \bigcap_a \ker i^*_a \phi = \bigcap_a \ker \lambda_a$, completing the proof. \hfill \Box

5. The kernel of $\phi$

In this section, we analyze the map $\phi$ from Definition 0.3. In particular, we verify part (c) of Theorem 0.6. To proceed, recall Notations 0.2, 1.2, 1.6, and 2.2.

Theorem 5.1. The kernel of $\phi$ is generated as a two-sided ideal by

$$g := e_1 e_5 - 4 e_2 e_4 + 3 e_3^2 + 2 e_6.$$ 

Proof. First, observe that as $e_1 e_5, e_2 e_4, e_3^2, e_6$ are elements of the standard basis for $U(W_+)$ (by Lemma 1.1(b)), they are linearly independent. So, we have that $g \neq 0$.

Now we verify that $\phi(g) = 0$ by using Lemma 1.3 and (1.4):

$$\phi(g) = u(u - 4w)v^4 - 4(u - w)v(u - 3w)v^3 + 3(u - 2w)v^2(u - 2w)v^2 + 2(u - 5w)v^5$$

$$= x(x - 4z)\mu y^4 - 4(x - z) y(x - 3z)\mu^2 y^3$$

$$+ 3(x - 2z) y^2(x - 2z)\mu^3 y^2 + 2(x - 5z) y^5$$

$$= x(x - y - 4z) y^4 - 4(x - z) y(x - 2y - 3z) y^3 + 3(x - 2z) y^2(x - 3y - 2z) y^2 + 2(x - 5z) y^5$$

$$= 0.$$ 

We take the following notation for the rest of the proof.
Notation 5.2 \((M, M', b_5, b_6, b_7, \eta)\). Consider the right \(B\)-modules

\[ M := uB \cap (u-w)vB \quad \text{and} \quad M' := b_5 B + b_6 B + b_7 B, \]

with
\[
\begin{align*}
b_5 &= (uv-vw)(u^3 - 6(uv-vw)u + 12u(uv-vw)), \\
b_6 &= (uv-vw)(-48(uv-3vw)v^2 - 36u(uv-2vw)v + u^4), \\
b_7 &= (uv-vw)(u^5 - 40((uv-vw)^2 u - 3(uv-vw)(uv-vw) + 3(uv-vw)^2)).
\end{align*}
\]

Further, take \(\eta : B \to A(0)\) to be the map induced by the projection \(\eta_0 : \hat{S} \to \hat{R} = \hat{S}/(w)\) from Notation 3.9.

The remainder of the proof will be established through a series of lemmas.

Lemma 5.3. We obtain that \(b_5, b_6, b_7 \in uB \cap (u-w)vB\). In other words, \(M' \subseteq M\).

Proof. Let
\[
\begin{align*}
(5.4) \quad r_5 &:= e_2(e_1^3 - 6e_2e_1 + 12e_1e_2), \\
(5.5) \quad r_6 &:= e_2(-48e_4 - 36e_1e_3 + e_1^4), \\
(5.6) \quad r_7 &:= e_2(e_1^5 - 40(e_2e_1 - 3e_2e_1e_2 + 3e_1e_2^2)).
\end{align*}
\]

We have as a consequence of the degree-5 relation of \(U(W_+)\) in Lemma 1.1(a) that
\[
(5.7) \quad r_5 = e_1(e_1^2e_2 - 3e_1e_2e_1 + 3e_2e_1^2 + 6e_2^2),
\]

and as a consequence of the degree-7 relation of \(U(W_+)\) in Lemma 1.1(a) that
\[
(5.8) \quad r_7 = e_1(e_1^4e_2 - 5e_1^3e_2e_1 + 10e_1^2e_2e_1^2 - 10e_1e_2e_1^3 + 5e_2e_1^4 - 40e_2^3).
\]

Thus \(r_5, r_7 \in e_1 U(W_+) \cap e_2 U(W_+)\). Since \(b_5 = \phi(r_5)\) and \(b_7 = \phi(r_7)\), these are both in \(uB \cap (uv-vw)B\).

Note that \(r_6 \in e_2 U(W_+)\), so \(b_6 = \phi(r_6) \in (u-w)vB\). Further,
\[
r_6 = e_1(-36e_2e_3 - 18e_5 + 2e_4e_1 - e_3e_1^2 + e_2e_1^3) + 12g.
\]

Thus, \(b_6 \in uB\) as well. \(\square\)

Lemma 5.9. Suppose that \(M = M'\). Then \(\ker \phi = (g)\) and the theorem holds.

Proof. Let \(K\) be the kernel of
\[
\alpha : B[-1] \oplus B[-2] \to B, \quad (b, b') \mapsto (ub + (uv-vw)b').
\]

It is a standard fact that the map
\[
\beta : M \to K
\]
defined by $\beta(r) = (u^{-1}r, -(uv - vw)^{-1}r)$ is an isomorphism of graded right $B$-modules, as in the proof of Lemma 2.3. Thus, $K$ is generated by $\beta(b_5), \beta(b_6),$ and $\beta(b_7)$ by the assumption. By Proposition A.1 in the Appendix, the kernel of $\pi_B$ is generated as a two-sided ideal of $\kk\langle t_1, t_2 \rangle$ by a degree-5 element $q_5$, a degree-6 element $q_6$, and a degree-7 element $q_7$. We compute $q_5$ and $q_7$ by applying the formula from Proposition A.1 to $\beta(b_5)$ and $\beta(b_7)$, and by using (5.4)–(5.8). Namely, take

\[
\begin{align*}
\tilde{b}_1^1 &= t_1^2 t_2 - 3t_1 t_2 t_1 + 3t_2 t_1^2 + 6t_2^2, \\
\tilde{b}_2^1 &= -t_1^3 + 6t_2 t_1 - 12t_1 t_2, \\
\tilde{b}_1^2 &= t_1^4 t_2 - 5t_1^3 t_2 t_1 + 10t_1^2 t_2 t_1^2 - 10t_1 t_2 t_1^3 + 5t_2 t_1^4 - 40t_2^3, \\
\tilde{b}_2^2 &= -t_1^5 + 40(t_2^2 t_1 - 3t_2 t_1 t_2 + 3t_1 t_2^2).
\end{align*}
\]

So, we have that

\[
\begin{align*}
q_5 &= t_1 \tilde{b}_1^1 + t_2 \tilde{b}_2^1 = [t_1, [t_1, [t_1, t_2]]] + 6[t_2, [t_2, t_1]], \\
q_7 &= t_1 \tilde{b}_1^2 + t_2 \tilde{b}_2^2 = [t_1, [t_1, [t_1, [t_1, [t_1, t_2]]]]] + 40[t_2, [t_2, [t_2, [t_2, t_1]]]].
\end{align*}
\]

By Lemma 1.1(a), $q_5$ and $q_7$ generate the kernel of $\pi$. So, $\ker \phi = \pi(\ker \pi_B) = (\pi(q_6))$. We see immediately that $(\ker \phi)_6$ is a 1-dimensional $\kk$-vector space, generated by $\pi(q_6)$. Since $g \in (\ker \phi)_6$ is nonzero, we have $g = \pi(q_6)$ up to a scalar multiple. Therefore, $\ker \phi = (g)$. \hfill $\Box$

Our goal now is to show that $M = M'$; we do this by comparing Hilbert series.

**Lemma 5.10.** *The Hilbert series of $M$ is $t^5(1-t)^{-2}(1-t^2)^{-1}$.***

**Proof.** Since $A(0) = \kk \oplus uR$ we have

\[
\text{hilb } A(0) = 1 + t(\text{hilb } R) = 1 + t \left( \frac{t}{(1-t)^2} \right) = \frac{1-t + t^2}{(1-t)^2}.
\]

On the other hand, it is well known that

\[
\text{hilb } Q = \text{hilb } \kk[x, y, yz] = \frac{1}{(1-t)^2(1-t^2)}.
\]

Since $\lambda_0 = \eta \circ \phi$, we get that $\ker \eta = \phi(\ker \lambda_0)$ (which is denoted by $I$ in Notation 3.1). So, by Lemma 3.2(c), we get

\[
\text{hilb } \ker \eta = \frac{t^4}{(1-t)^2(1-t^2)}.
\]
Then
\[ \text{hilb } B = \text{hilb } A(0) + \text{hilb ker } \eta \]
\[ = \frac{1 - t + t^3 - t^4}{(1-t)^2(1-t^2)} + \frac{t^4}{(1-t)^2(1-t^2)} = \frac{1 - t + t^3}{(1-t)^2(1-t^2)}. \]

Finally, we compute \( \text{hilb } M \) from the exact sequence
\[ 0 \longrightarrow M \overset{\beta}{\longrightarrow} B[-1] \oplus B[-2] \overset{\alpha}{\longrightarrow} B \longrightarrow \mathbb{K} \longrightarrow 0, \]
where \( \alpha, \beta \) are as in the proof of Lemma 5.9. This gives
\[ \text{hilb } M = (t^2 + t - 1)(\text{hilb } B) + 1 = \frac{t^5}{(1-t)^2(1-t^2)}, \]
as claimed. \( \square \)

We now provide results on the Hilbert series of \( M' \).

**Lemma 5.11.** We have that \( \text{hilb } \eta(M') \geq t^5(1-t)^{-2} \).

**Proof.** Let \( a_5 := \eta(b_5) \) and \( a_6 := \eta(b_6) \). Then
\[ a_5 = uvu(u^2 - 6vu + 12uv) \]
\[ = xy(x - 2y)((x - 3y)(x - 4y) - 6y(x - 4y) + 12(x - 3y)y) \]
\[ = x^2(y - x)(x - 2y)y, \]
\[ a_6 = uvu(u^3 - 36uv^2 - 48v^3) \]
\[ = xy(x - 2y)((x - 3y)(x - 4y)(x - 5y) - 36(x - 3y)v^2 - 48y^3) \]
\[ = x^2(y - x)(x - 2y)y(x - 11y) \]
\[ = a_5(u - 6v). \]
Since \( a_5u \) and \( a_5(u - 6v) \) are in \( \eta(M') \) and \( u \) and \( u - 6v \) span \( R_1 \), we have \( a_5 R_1 \subseteq \eta(M') \). We get that \( \eta(M') \supseteq a_5 A(0) + a_5 R_1 A(0) \), as \( \eta(M') \) is a right \( A(0) \)-module and contains \( a_5 R_{\leq 1} \). Since \( A(0) + R_1 A(0) = R \), we obtain that \( \eta(M') \supseteq a_5 R \). Now as \( \text{hilb } R = (1-t)^{-2} \), we conclude that \( \text{hilb } \eta(M') \geq t^5(1-t)^{-2} \). \( \square \)

**Lemma 5.12.** We have that \( \text{hilb}(M' \cap \ker \eta) \geq t^7(1-t)^{-2}(1-t^2)^{-1} \).

**Proof.** Again, recall that \( \ker \eta = \phi(\ker \lambda_0) \), which is denoted by \( I \) in Notation 3.1. Moreover by Lemma 3.2(c), we have \( I = Qp = pQ \), where \( p = v^3 w - v^2 w^2 \). Let
\[ h := (uv - vw)(u + 2v)p = (xy - yz)x(y^3z - y^2z^2). \]

**Claim.** We have
\[ b_5 Q + b_6 Q + b_7 Q \ni x(xy - yz)(xyz + y^2 z) = (uv - vw)(u + 2v)(u + 4v)vw. \]
The proof of this claim is provided in the Appendix; see Claim A.6(a). Since $M' \cap I \supseteq M'I = b_5 Qp + b_6 Qp + b_7 Qp$, we have

\[(5.13) \quad M' \cap I \supseteq (uv - vw)(u + 2v)(u + 4v)vwpQ = (xy - yz)x(y^3z - y^2z^2)(x + y)yzQ = h(x + y)yzQ.\]

We now show by induction that $M' \cap I \supseteq hQ_n$ for all $n \geq 0$.

**Claim.** $M' \cap I \supseteq hQ_n$ for $n = 0, 1, 2$.

The proof of this assertion is provided in the Appendix; see Claim A.6(b). We will prove the result for larger $n$ by geometric arguments. The maximal graded nonirrelevant ideals of $\mathbb{k}[x, y, yz]$ are in bijective correspondence with $\mathbb{k}$-points of the weighted projective plane $\mathbb{P}(1, 1, 2)$ [Harris 1992, Example 10.27]. We use the notation $(a : b : c)$ to denote a point of $\mathbb{P}(1, 1, 2)$. Let

$$K(n) := (x - ny)\mathbb{k}[x, y, yz] + (y^2 - yz)\mathbb{k}[x, y, yz]$$

be the graded ideal of polynomials vanishing at $(n : 1 : 1)$.

Suppose now that $M' \cap I \supseteq hQ_n$ for some $n \geq 2$. Then $M' \cap I$ contains

\[h(Q_nu + Q_{n-1}(uv - vw)) = h\left(\left((x - (n + 7)y)\mathbb{k}[x, y, yz] + ((x - (n + 6)y)y - yz)\mathbb{k}[x, y, yz]\right)_{n+1}\right) = h\left(\left((x - (n + 7)y)\mathbb{k}[x, y, yz] + (y^2 - yz)\mathbb{k}[x, y, yz]\right)_{n+1}\right) = hK(n + 7)_{n+1}.\]

From (5.13), we get $(M' \cap I)_{n+1} \ni h(xy + y^2)yz^{n-2}$. Since $(xy + y^2)yz^{n-2}$ does not vanish at $(n + 7 : 1 : 1)$, it is not in $hK(n + 7)_{n+1}$. Thus,

$$hK(n + 7)_{n+1} + \mathbb{k}h(xy + y^2)yz^{n-2} = h\mathbb{k}[x, y, yz]_{n+1} \subseteq M' \cap I,$$

where the equality holds as $hK(n + 7)_{n+1}$ is codimension 1 in $h\mathbb{k}[x, y, yz]_{n+1}$. Hence, $hQ_{n+1} \subseteq M' \cap I$.

Now, by induction, we obtain $M' \cap I \supseteq hQ$. Since $\text{hilb} Q = (1 - t)^{-2}(1 - t^2)^{-1}$, we have

$$\text{hilb}(M' \cap I) \geq \frac{t^7}{(1 - t^2)(1 - t^2)}. \quad \square$$

**Lemma 5.14.** We have that $\text{hilb} M = \text{hilb} M' = t^5(1 - t)^{-2}(1 - t^2)^{-1}$. As a result, $M = M'$.

**Proof.** Combining Lemmas 5.11 and 5.12, we have

$$\text{hilb}(M') \geq \frac{t^5}{(1 - t)^2} + \frac{t^7}{(1 - t)^2(1 - t^2)} = \frac{t^5}{(1 - t)^2(1 - t^2)}.$$
On the other hand, by Lemmas 5.3 and 5.10,
\[ \text{hilb}(M') \leq \frac{t^5}{(1-t)^2(1-t^2)}. \]
Thus, \( \text{hilb} M = \text{hilb} M'. \) Since \( M' \subseteq M \) again by Lemma 5.3, we conclude that \( M = M' \).

Theorem 5.1 now follows from Lemmas 5.9 and 5.14.

Remark 5.15. A shorter proof of Theorem 5.1 follows from the results of [Conley and Martin 2007]. Recall from Notation 3.9 that we may extend \( \phi \) to a map \( \widehat{\phi} : U(W) \to \widehat{S} \), using the same formula (0.4) for \( \widehat{\phi}(e_n) \) with \( n \leq 0 \). Then [Conley and Martin 2007, Theorem 1.3] and (3.15), together with Theorem 4.1, give that \( \ker \widehat{\phi} = (e_{-1}e_3 - 4e_0e_2 + 3e_1^2 + 2e_2) \). The reader may verify that

\[ \text{ad}(e_{-1})(g) = [e_{-1}, [e_{-1}, [e_{-1}, [e_{-1}, g]]]] = 24(e_{-1}e_3 - 4e_0e_2 + 3e_1^2 + 2e_2). \]

Since \( \widehat{\phi}(g) = 0 \), we have \( (g) \subseteq \ker \widehat{\phi} = (e_{-1}e_3 - 4e_0e_2 + 3e_1^2 + 2e_2) \subseteq (g) \), so all are equal.

6. A partial result on chains of two-sided ideals

It is not known whether \( U(W_+) \) satisfies the ascending chain condition (ACC) on two-sided ideals; see Question 0.11. We do not answer this question here; however, we prove the partial result that the non-noetherian factor \( B \) of \( U(W_+) \) does have ACC on two-sided ideals.

Recall Notations 0.2, 1.2, 1.6; in particular, \( Q \) is the subalgebra of \( S \) generated by \( u, v, vw \). Throughout, we consider \( B \) as a subalgebra of \( Q \). We begin by proving:

Lemma 6.1. Let \( h \) be a nonzero, homogeneous, normal element of \( Q \), and let \( a \in \mathbb{k} \). Then the \( Q \)-bimodules
\[ N := hQ / hvQ \quad \text{and} \quad M_a = hQ / h(vw - av^2)Q \]
are noetherian \( B \)-bimodules under the action induced from \( Q \).

Proof. We remark that any normal element of \( Q \) must be in the commutative subalgebra \( \mathbb{k}[v, vw] \), and thus, must commute with \( v \) and \( vw \). In particular, \( vNQ = 0 \) and \( (vw - av^2)QM_a = 0 = M_a(vw - av^2)Q \).

Let \( \theta : Q \to Q / vQ \) be the canonical projection. (Note that \( vw \notin \ker \theta \).) Since \( u(vw) - (vw)u = 2w^2w \) is contained in \( \ker \theta \), the image \( Q / vQ \) is commutative. It is easy to see that \( Q / vQ \cong \mathbb{k}[s, t] \) under the identification \( s = \theta(u), \ t = \theta(vw) = \theta(uv - vw) \). Note that \( s = \theta(\phi(e_1)) \) and \( t = \theta(\phi(e_2)) \) are in \( B \). So, \( \theta(B) = Q / vQ \). Thus, a left \( B \)-submodule of \( hQ / hvQ \) is simply an ideal of \( \mathbb{k}[s, t] \). So, \( hQ / hvQ \)
is noetherian as a left $B$-module. As chains of $B$-bimodules are also chains of left $B$-modules, $hQ/hvQ$ is also a noetherian $B$-bimodule.

Now define an algebra homomorphism $\delta : Q \to R$ by $\delta(u) = u$, $\delta(v) = v$, and $\delta(uw) = av^2$. (Note that $\delta = \eta_a|_Q$ from Notation 3.9.) It is easy to see that $\ker \delta = (uv - av^2)Q$ and that $\delta$ is surjective. Note also that $\delta(\phi(e_1)) = u$ and $\delta(\phi(e_2)) = uv - av^2$. Thus, $\delta(B) = A(a)$ as subalgebras of $R$. If $a \neq 0, 1$, then by Proposition 2.1, $A(a) \supseteq R_{\geq 4}$ is noetherian, and $R$ is a finitely generated right $A(a)$-module. If $a = 0$, then $R = A(0) + vA(0)$ is again a finitely generated right $A(0)$-module, and $A(0)$ is noetherian. Thus for $a \neq 0$, $M_a$ is also a finitely generated right $A(a)$-module. So, $M_a$ is noetherian as a left $B$-module, let alone a $B$-bimodule.

If $a = 1$ then we have, similarly, that $\delta(B) = A(1)$ is noetherian, and that $R = A(1) + A(1)v$ is a finitely generated left $A(1)$-module. It follows that $M_a$ is a finitely generated left $A(a)$-module. So, $M_a$ is noetherian as a left $B$-module, and again as a $B$-bimodule.

We now use geometric arguments to show:

**Proposition 6.2.** Suppose that $k$ is algebraically closed, and let $K \subseteq Q$ be a nonzero graded ideal. Then $Q/K$ is a noetherian $B$-bimodule.

**Proof.** Let $T$ be the commutative ring $k[x, y, yz]$. We consider $K$ as a subset of $T$, since (via Lemma 1.3) $Q = T^\mu$ and $T$ have the same underlying vector space. For all $n, m \in \mathbb{N}$, we have

$$K_{n+m} \supseteq K_nQ_m = K_n(T_m)^\mu^n = K_nT_m,$$

and so $K$ is also an ideal of $T$. Further,

$$K_{n+m} \supseteq Q_mK_n = T_m(K_n)^\mu^m.$$  

If $T$ were generated in degree 1, one could obtain directly from (6.3) and (6.4) that $K_n$ is $\mu$-invariant for $n \gg 0$ (or see [Artin and Stafford 1995, Lemma 4.4]). A similar statement holds in our case; however, a proof would take us too far afield so we work more directly with the graded pieces of $K$.

Choose $n_0$ so that $K_{n_0} \neq 0$. For all $n \geq n_0$, let $h_n \neq 0$ be a greatest common divisor of $K_n$, considered as a subset of $T_n$. By (6.3), $h_{n+1} | h_nx, h_ny$. Since $x, y$ have no common divisor, we have $h_{n+1} | h_n$ for all $n \geq n_0$. This chain of divisors must stabilize, and thus there is $n_1 \geq n_0$ such that $h_{n+1}h_n^{-1} \in k$ for $n \geq n_1$. Let $h := h_{n_1}$.

By (6.4), $h | \mu^m(h)$ for all $m \in \mathbb{N}$, so $h$ is an eigenvector of $\mu$. Thus, $h$ is normal in $Q$. Since $h \mid f$ for all $f \in K$, we can write $K = hJ$ for some $J \subseteq Q$. Since $h$ is normal, $J$ is again an ideal of $Q$. So, (6.3) and (6.4) apply to $J$.

Since $h \in k[v, vw]$ and $k$ is algebraically closed, we have

$$h = (vw - a_1v^2) \cdots (vw - a_nv^2)v^k$$
for some $n, k \in \mathbb{N}$ and $a_1, \ldots, a_n \in \mathbb{k}$. Applying Lemma 6.1 repeatedly, we obtain that $Q/hQ$ is a noetherian $B$-bimodule.

From the exact sequence

$$0 \to hQ/hJ \to Q/K \to Q/hQ \to 0,$$

it suffices to prove that $hQ/hJ$ is a noetherian $B$-bimodule. We make a geometric argument to do so.

Graded ideals of $T$ correspond to subschemes of the weighted projective plane $\mathbb{P}(1, 1, 2)$. Note that $\mu$ acts on $\mathbb{P}(1, 1, 2)$ by $\mu(a : b : c) = (a-b : b : c)$.

Let $Y_n$ be the subset of $\mathbb{P}(1, 1, 2)$ defined by the vanishing of the polynomials in $J_n$, considered now as a subset of $T$. By the definition of $h$, for $n \geq n_1$ the polynomials in $J_n$ have no nontrivial common factor, and so $\dim Y_n \leq 0$. By (6.3) and (6.4), we have

$$Y_{n+1} \subseteq Y_n \cap \mu(Y_n)$$

for $n \geq n_1$. It follows that there exists $n_2 \geq n_1$ such that

$$Y_{n+1} = Y_n = \mu(Y_n)$$

for $n \geq n_2$. Let $Y := Y_{n_2}$. Since $\mu$-orbits in $\mathbb{P}(1, 1, 2)$ are either infinite or trivial, each point of $Y$ is $\mu$-invariant. Note that $Y$ is the subset of $\mathbb{P}(1, 1, 2)$ defined by $J$, considered as an ideal of $T$.

Let $P$ be an associated prime of $J$. Since $J$ is graded, $P$ is graded. By using the Nullstellensatz, with the fact that $\dim Y \leq 0$, we get that either $P = T_+$, or $P$ defines some point $(a : b : c) \in Y$. In the first case, certainly $y \in P$. In the second case, $(a : b : c) = \mu(a : b : c) = (a-b : b : c)$ and so $b = 0$. Again, $y \in P$.

The radical $\sqrt{J}$ is the intersection of the associated primes of $J$. Since $y$ is contained in all associated primes, $y \in \sqrt{J}$. Thus, there is some $n$ such that $y^n = v^n \in J$. So, $hQ/hJ$ is a factor of $hQ/hv^nQ$. Applying Lemma 6.1 again, we see that $hQ/hJ$ is a noetherian $B$-bimodule, as desired.

We now prove Proposition 0.12. In fact, we show:

**Proposition 6.6.** The ring $Q$ is noetherian as a $B$-bimodule. As a consequence, $B$ satisfies ACC on two-sided ideals.

**Proof.** Let $\mathbb{k}'$ be an algebraic closure of $\mathbb{k}$. If $Q \otimes_{\mathbb{k}} \mathbb{k}'$ were a noetherian bimodule over $B \otimes_{\mathbb{k}} \mathbb{k}'$, then $Q$ would be a noetherian $B$-bimodule; this holds as $\mathbb{k}'$ is faithfully flat over $\mathbb{k}$ [Goodearl and Warfield 2004, Exercise 17T]. So it suffices to prove the result in the case that $\mathbb{k}$ is algebraically closed. By standard arguments, it is sufficient to show that $Q$ satisfies ACC on graded $B$-subbimodules, or equivalently, that any nonzero graded $B$-subbimodule of $Q$ is finitely generated.
Let $K$ be a nonzero graded $B$-subbimodule of $Q$. Since $B \supseteq Qp = pQ$ by Lemma 3.2(c), we have that $K = BKB \supseteq QpKpQ$. Since $Q$ is noetherian, there is a finite-dimensional graded vector space $V \subseteq K$ with $QpKpQ = QpVpQ$.

By Proposition 6.2, the $B$-bimodule $Q/QpVpQ$ is noetherian. Thus the $B$-subbimodule $K = QpVpQ$ of $Q/QpVpQ$ is finitely generated. So, there is a finite-dimensional vector space $W \subseteq K$ such that $K \supseteq BWB C QpVpQ_{\text{BWB}} C BVB$. As $V, W \subseteq K$, certainly $K \supseteq BWB + BV$. Thus, $K$ is finitely generated by $V + W$, as needed.

Appendix

We first give a general result from ring theory to which we were not able to find a reference; it is the converse to [Rogalski 2014, Lemma 2.11]. We then finish by presenting Maple and Macaulay2 routines and proofs of computational claims asserted above.

A result in ring theory. Consider the following setting. Let $T = \kk\{t_1, \ldots , t_n\}$ be the free algebra. Set $\deg t_i = d_i \in \mathbb{Z}_{\geq 1}$, and grade $T$ by the induced grading. Suppose that $\pi : T \to A$ is a surjective homomorphism of graded algebras, and let $a_i = \pi(t_i)$. By definition, the $a_i$ generate $A$ as an algebra. Let $J = \ker \pi$. Consider the map

$$\alpha : A[-d_1] \oplus \cdots \oplus A[-d_n] \to A$$

that sends $(r_1, \ldots , r_n) \mapsto \sum_{i=1}^n a_ir_i$. Note that $\alpha$ is a homomorphism of graded right $A$-modules, and set $K = \ker \alpha$. Let $b^1, \ldots , b^m$ be homogeneous elements of $K$, where $b^j = (b^j_1, \ldots , b^j_n) \in A[-d_1] \oplus \cdots \oplus A[-d_n]$. For all $1 \leq i \leq n$ and $1 \leq j \leq m$, choose homogeneous elements $\tilde{b}^j_i \in T$ so that $\pi(\tilde{b}^j_i) = b^j_i$. Let $q_j = \sum_{i=1}^n t_i \tilde{b}^j_i$. (Note that the $q_i$ are homogeneous; in fact, $\deg q_j = \deg b^j$.)

**Proposition A.1.** Retain the notation above. If $\{b^1, \ldots , b^m\}$ generate $K$ as a right $A$-module, then $\{q_1, \ldots , q_m\}$ generate $J$ as an ideal of $T$.

**Proof.** Let $J'$ be the ideal of $T$ generated by $q_1, \ldots , q_m$. Since

$$\pi(q_j) = \sum_i \pi(t_i)\pi(\tilde{b}^j_i) = \sum_i a_i \tilde{b}^j_i = \alpha(b^j) = 0,$$

we get that $J' \subseteq J$.

We prove by induction that $J'_k = J_k$ for all $k \in \mathbb{N}$. Certainly $J'_0 = J_0 = 0$. Assume that we have shown that $J'_{<k} = J_{<k}$, and let $h \in J'_k$. Because $T$ is generated by $t_1, \ldots , t_n$, there are homogeneous elements $f_1, \ldots , f_n \in T$, with $\deg f_i = k - d_i$, and
such that \( h = \sum_i t_i f_i \). Then

\[
0 = \pi(h) = \sum_{i=1}^n a_i \pi(f_i) = \alpha(\pi(f_1), \ldots, \pi(f_n)).
\]

Since the \( b^j \) generate \( K = \ker \alpha \), there are homogeneous elements \( r_1, \ldots, r_m \in A \) with \( (\pi(f_1), \ldots, \pi(f_n)) = \sum_{j=1}^m b^j r_j \). Let \( \tilde{r}_1, \ldots, \tilde{r}_m \) be homogeneous lifts of \( r_1, \ldots, r_m \). Then for each \( i \) we have

\[
\pi(f_i) = \sum_j b_i^j r_j = \sum_j \pi(\tilde{b}_i^j \tilde{r}_j).
\]

So, \( f_i - \sum_j \tilde{b}_i^j \tilde{r}_j \in J = \ker \pi \). Since \( \deg f_i = k - d_i < k \), each \( f_i - \sum_j \tilde{b}_i^j \tilde{r}_j \in J' \). Thus \( J' \) contains

\[
\sum_i t_i f_i - \sum_i t_i \left( \sum_j \tilde{b}_i^j \tilde{r}_j \right) = h - \sum_j \left( \sum_i t_i \tilde{b}_i^j \right) \tilde{r}_j = h - \sum_j q_j \tilde{r}_j.
\]

As \( \sum_i t_i \tilde{b}_i^j = q_j \in J' \) by definition, we have \( \sum_j q_j \tilde{r}_j \in J' \). Therefore, \( h \in J'_k \).

**Proof of assertions: Maple routines.** We begin with the following Maple routine.

**Routine A.2.** A Maple routine to compute the kernel of \( \lambda_a \) at a specific degree \( n \) is presented as follows.

Recall from Lemma 1.1(b) that a \( \mathbb{k} \)-vector space basis of \( U(W_+)_n \) is given by partitions of \( n \). Moreover, we employ Lemma 1.3 and (1.4) to input a function \( f(i, j) = \lambda_a(e_i)^{\mu_j} \), considered as an element of \( \mathbb{k}[x, \gamma] \).

```maple
with(combinat,partition): with(LinearAlgebra):
# Choose value of n
n:=1;
N:=partition(n): f:=(i,j)->((x-j*y)-(i-1)*a*y)*y^(i-1):
Given a partition \( d \) of \( n \), we create a list of double-indexed entries
\( m = (m[i_1, j_1], \ldots, m[i_k, j_k]) \). Here, \( i_\ell = n_\ell \) and \( j_1 = 0 \) with \( j_\ell = j_{\ell-1} + n_{\ell-1} \) for \( \ell \geq 2 \). Then
\[
\lambda_a(e_{i_1} \cdots e_{i_k}) = m[i_1, j_1] \cdots m[i_k, j_k],
\]
denoted by \( P \). (Here, \( P \) is in list form, which we put in matrix form later for multiplication. The \( k \)-loop enables us to form the product of elements \( m[i_*, j_*] \).)

P:=[[]]:
for d from 1 to nops(N) do M:=[[]]:
j[1]:=0:
for l from 1 to nops(N[d]) do j[l+1]:=j[l]+ N[d][l]: M:=[op(M),f(N[d][l],j[l])]:
s[0]:=1:
for k from 1 to nops(M) do s[k]:=s[k-1]*M[k]:
end do:
P:=[op(P),expand(s[nops(M)])]:
end do:
```
Next, we define an arbitrary element of $\lambda_a(U(W_+)_n)$, namely $p := \sum_{i=1}^k b_i \lambda_a(e_{n_i})$.

```maple
B:=[];
for i from 1 to nops(N) do B:=[op(B),b[i]]: end do:
Bvec:=convert(B,Matrix):
Pvec:=convert(P,Matrix):
q:=Multiply(Bvec,Transpose(Pvec)):
p:=expand(q[1][1]):
for i from 1 to nops(N) do B:=[op(B),b[i]]: end do:
B:=[];
```

Then we set the coefficients of $p$ equal to 0 and solve for the $b_i$. We rule out the case when $a = 0, 1$.

```maple
Coeffs:=[coeffs(collect(p,[x,y], 'distributed'),[x,y])]:
solve([op(Coeffs),a<>0,a<>1]);
```

Note that the number of free $b_i$ equals the $k$-vector space dimension of $(\ker \lambda_a)_n$.

We continue by verifying the claim from the proof of Lemma 2.6.

**Claim A.3.** Retain the notation from Section 2, especially that in Lemma 2.6. We have that $J_5 A(a)_2 \nsubseteq J_6 A(a)_1$.

**Proof.** Nonzero elements in $J_5$ arise as elements of $(u-av)vA(a)_3$ that are divisible by $u$ on the left. We obtain that

$$(u-av)vA(a)_3 = k[(uv-av^2)(u^3)] \oplus k[(uv-av^2)(u(u-av)v)] \oplus k[(uv-av^2)((u-2av)v^2)]$$

$$= k[r_1] \oplus k[r_2] \oplus k[r_3],$$

where

$$r_1 := u^4v - (3 + a)u^3v^2 + (6 + 6a)u^2v^3 - (6 + 18a)uv^4 + 24av^5,$$

$$r_2 := u^3v^2 - (2 + 2a)u^2v^3 + (2 + 5a + a^2)uv^4 - (6a + 2a^2)v^5,$$

$$r_3 := u^2v^3 - (1 + 3a)uv^4 + (2a + 2a^2)v^5.$$

We see this as $v^k u = uv^k - kv^{k+1}$ for all $k \geq 1$, $vu^2 = u^2v - 2uv^2 + 2v^3$, $v^2u^2 = u^2v^2 - 4uv^3 + 6uv^4$, $vu^3 = u^3v - 3u^2v^2 + 6uv^3 - 6v^4$, and $v^2u^3 = u^3v^2 - 6u^2v^3 + 18uv^4 - 24v^5$ in $R$. Eliminating the $v^5$ term of $r_1, r_2, r_3$, we get that $J_5$ is generated by

$$s_1 := (3 + a)r_1 + 12r_2,$$

$$s_2 := (1 + a)r_1 - 12r_3,$$

$$s_3 := (1 + a)r_2 + (3 + a)r_3.$$

By way of contradiction, suppose that $J_5 A(a)_2 \nsubseteq J_6 A(a)_1$. Recall that $J \subseteq L$, where $L := uR \cap (u-av)vR$. Further, $J_6 = L_6$, and $L = rR$ for

$$r = u(uv + (1-a)v^2) = (uv - av^2)(u + 2v).$$

So, $s_i = r(c_{i1}u^2 + c_{i2}uv + c_{i3}v^2) \in J_5 \subseteq rR_2$, for some $c_{ij} \in k$. We produce these coefficients $c_{ij}$ below.
r1 := x*(x-y)*(x-2*y)*(x-3*y)*y - (3+a)*x*(x-y)*(x-2*y)*y^2 + (6+6*a)*x*(x-y)*y^3 - (6+18*a)*x*y^4 + 24*a*y^5:

r2 := x*(x-y)*(x-2*y)*y^2 - (2+2*a)*x*(x-y)*y^3 + (2+5*a+a^2)*x*y^4 - (6*a+2*a^2)*y^5:

r3 := x*(x-y)*y^3 - (1+3*a)*x*y^4 + (2*a+2*a^2)*y^5:

s1 := (3+a)*r1 + 12*r2:
s2 := (1+a)*r1 - 12*r3:
s3 := (1+a)*r2 + (3+a)*r3:

r := x*((x-y)*y+(1-a)*y^2):

eq1 := s1 - r*(c11*(x-3*y)*(x-4*y)+c12*(x-3*y)*y+c13*y^2):

eq2 := s2 - r*(c21*(x-3*y)*(x-4*y)+c22*(x-3*y)*y+c23*y^2):

eq3 := s3 - r*(c31*(x-3*y)*(x-4*y)+c32*(x-3*y)*y+c33*y^2):

Coeffs1 := [coeffs(collect(eq1, [x,y], 'distributed'), [x,y])]:
Coeffs2 := [coeffs(collect(eq2, [x,y], 'distributed'), [x,y])]:
Coeffs3 := [coeffs(collect(eq3, [x,y], 'distributed'), [x,y])]:

solve(Coeffs1); solve(Coeffs2); solve(Coeffs3); 

> {a = a, c11 = 3 + a, c12 = 6 - 2 a, c13 = -4 a}
> {a = a, c21 = 1 + a, c22 = -2 - 2 a, c23 = -4 + 8 a}
> {a = a, c31 = 0, c32 = 1 + a, c33 = 1 - 2 a - a }

Therefore,

s1 = r((3+a)u^2 + (6-2a)uv - 4av^2),

s2 = r((1+a)u^2 - (2+2a)uv - (4-8a)v^2),

s3 = r((1+a)uv + (1-2a-a^2)v^2).

By assumption, for i = 1, 2, 3 we have s_i(u-av) = w_i u for some w_i ∈ J_6. Take an arbitrary element of J_6 = L_6 = rR_3, namely r(d_{i1}u^3 + d_{i2}u^2v + d_{i3}uv^2 + d_{i4}v^3) for d_{ij} ∈ k. Then, for some α_i ∈ k,

(A.4) \quad p_i := s_i(u-av) = α_i r(d_{i1}u^4 + d_{i2}u^2vu + d_{i3}uv^2u + d_{i4}v^3u).

Continuing with the code we enter:

s1 := r*((3+a)*(x-3*y)*(x-4*y)+(6-2*a)*(x-3*y)*y-4*a*y^2):
s2 := r*((1+a)*(x-3*y)*(x-4*y)-(2+2*a)*(x-3*y)*y-(4-8*a)*y^2):
s3 := r*((1+a)*(x-3*y)*y+(1-2*a-a^2)*y^2):
p1 := r*((x-(5+a)*y)*y):
p2 := r*((x-(5+a)*y)*y):
p3 := r*(x-(5+a)*y)*y:

Eq1 := p1 - alpha1*r*(d11*(x-3*y)*(x-4*y)*(x-5*y)*(x-6*y) + d12*(x-3*y)*(x-4*y)*y*(x-6*y) + d13*(x-3*y)*y^2*(x-6*y) + d14*y^3*(x-6*y)):

Eq2 := p2 - alpha2*r*(d21*(x-3*y)*(x-4*y)*(x-5*y)*(x-6*y) + d22*(x-3*y)*(x-4*y)*y*(x-6*y) + d23*(x-3*y)*y^2*(x-6*y) + d24*y^3*(x-6*y)):

Eq3 := p3 - alpha3*r*(d31*(x-3*y)*(x-4*y)*(x-5*y)*(x-6*y) + d32*(x-3*y)*(x-4*y)*y*(x-6*y) + d33*(x-3*y)*y^2*(x-6*y) + d34*y^3*(x-6*y)):

CCoeffs1 := [coeffs(collect(Eq1, [x,y], 'distributed'), [x,y])]:
CCoeffs2 := [coeffs(collect(Eq2, [x,y], 'distributed'), [x,y])]:
CCoeffs3 := [coeffs(collect(Eq3, [x,y], 'distributed'), [x,y])]:

for i from 1 to nops([L1]) do print(L1[i][1]); end do;
> a = 9, a = 1
for i from 1 to nops([L2]) do print(L2[i][1]); end do;
> a = 1, a = 1/2
for i from 1 to nops([L3]) do print(L3[i][1]); end do;
> a = 1, a = RootOf(-2 - 3 _Z + _Z ) - 1
So in order for (A.4) to hold for \(i = 1, 2, 3\), we must have \(a = 1\). This yields a contradiction, as desired.

We now verify the claim from the proof of Proposition 2.8.

**Claim A.5.** Retain the notation from Section 2, especially that in Proposition 2.8. We have that \(h_2, h_3, e_1 h_1, h_1 e_1\) are \(\mathbb{k}\)-linearly independent and that

\[
\begin{align*}
h_4 &= 2a(2a + 1)h_2 - h_3 - (6 + 4a)e_1 h_1 + (2 + 4a)h_1 e_1, \\
h_5 &= 4a^2 h_2 - h_3 - (4 + 4a)e_1 h_1 + (4a)h_1 e_1.
\end{align*}
\]

**Proof.** This is established simply by considering the linear combination

\[c_1 h_2 + c_2 h_3 + c_3 h_4 + c_4 h_5 + c_5 e_1 h_1 + c_6 h_1 e_1,\]

setting the coefficients of the basis elements of \(U(W_+)_6\) equal to 0, and solving for \(c_1, \ldots, c_6\). By Lemma 1.1(a), the basis elements of \(U(W_+)_6\) are

\[
e_1^6, e_1^4 e_2, e_1^2 e_2^2, e_2^3, e_1^3 e_3, e_1 e_2 e_3, e_2^2, e_1^2 e_4, e_2 e_4, e_1 e_5, e_6.
\]

So, we establish the claim via the following Maple routine:

```maple
with(LinearAlgebra):
M:=Matrix([ [0,0,0,0,0,0,3,0,-4,1,2],
[0,-4,-4,4,0,20*a^2+14*a-7,0,0,-16*a^2-18*a-5,16*a^3+36*a^2+16*a-2],
[0,0,4,0,-4,7-4*a,0,0,4*a+1,-4*a^2-4*a+2],
[0,0,4,0,0,7-14*a,-4,0,14*a+5,-12*a^2-16*a+2],

eval(V,[c3=1,c4=0]);
>[[c1 = -2 (2 a + 1) a, c2 = 1, 1 = 1, 0 = 0, c5 = 6 + 4 a, c6 = -2 - 4 a]]
eval(V,[c3=0,c4=1]);
>[[c1 = -4 a , c2 = 1, 0 = 0, 1 = 1, c5 = 4 + 4 a, c6 = -4 a]]

We now verify the claims from the proof of Lemma 5.12.

Claim A.6. Retain the notation from Lemma 5.12.

(a) \(b_5 Q + b_6 Q + b_7 Q \ni x(y - z)xy + y^2z = (uv - vw)(u + 2v)(u + 4v)vw.\)

(b) \((M' \cap \ker \eta) \supseteq hQ_i\) for \(i \leq 2\), where

\[
h = (uv - vw)(u + 2v)(v^3w - v^2w^2) = (x - y)z(x^3 - y^2z^2).
\]

Proof. (a) Using Lemma 1.3 and (1.4), we see that \(-\frac{1}{6}b_5u + b_5v + \frac{1}{6}b_6 = (uv - vw)(u + 2v)(u + 4v)vw\):

\[
b5 := (x - y)z((x - 2y)z(x - 3y)z(x - 4y)z - 6((x - 2y)z(x - 3y)z(x - 4y)z) + 12((x - 3y)z(x - 4y)z) + 12((x - 3y)z(x - 4y)z) + 12((x - 4y)z(x - 5y)z));
b6 := (x - y)zw((x - 2y)z(x - 3y)z(x - 4y)z(x - 5y)z) - 36((x - 2y)z(x - 3y)z(x - 4y)z(x - 5y)z);
\]

\[
r := (x - y)z((x - 2y)z(x - 3y)z(x - 4y)z(x - 5y)z);
p := c1b5(x - 5y) + c2b5y + c3b6 - r;
\]

\[
\text{Coeffs} := \{\text{coeffs(collect(p, [x, y, z], 'distributed'), [x, y, z])};
\]

\[
\text{solve(Coeffs)};
\]

\[
\{c1 = -1/6, c2 = 1, c3 = 1/6\}
\]

(b) It is easy to see that \(\eta(h) = 0\), so it suffices to show that \(hQ_0, hQ_1, hQ_2\) are in \(M' := b_5 B + b_6 B + b_7 B\). Recall that \(Q\) is the subalgebra of \(S\) generated by \(u, v, vw\), and \(B\) is the subalgebra of \(S\) generated by \(u, uv - vw\). Since \(\text{deg}(h) = 7\),

\[
hQ_0 = \{c_1h | c_1 \in \mathbb{k}\},
hQ_1 = \{c_2hu + c_3hv | c_i \in \mathbb{k}\},
hQ_2 = \{c_4hu^2 + c_5hv + c_6h^2v^2 + c_7huvw | c_i \in \mathbb{k}\},
\]

and moreover,

\[
M'_7 = \{d_1b_5u^2 + d_2b_5(uv - vw) + d_3b_6u + d_4b_7 | d_i \in \mathbb{k}\},
M'_8 = \{d_5b_5u^3 + d_6b_5(uv - vw) + d_7b_5(uv - vw)u + d_8b_6u^2 + d_9b_6(uv - vw) + d_10b_7u | d_i \in \mathbb{k}\},
M'_9 = \{d_{11}b_5u^4 + d_{12}b_5u^2(uv - vw) + d_{13}b_5(uv - vw)u + d_{14}b_5(uv - vw)u^2 + d_{15}b_5(uv - vw) + d_{16}b_6u^3 + d_{17}b_6u(uv - vw) + d_{18}b_6(uv - vw)u + d_{19}b_7u^2 + d_{20}b_7(uv - vw) | d_i \in \mathbb{k}\},
\]
Continuing with the code in part (a), we enter:

\[ b_7 := (x^2y - yz)(x - 2y)(x - 3y)(x - 4y)(x - 5y)(x - 6y) - 40((x - 2y)y - yz)(x - 4y)(x - 5y)(x - 6y) - 3((x - 2y)y - yz)(x - 4y)(x - 5y)(x - 6y) + 3(x - 2y)(x - 3y)(y - yz)(x - 5y)(x - 6y) \] 

\[ h := (x^2y - yz)x(y - 3z - 2z^2) ; \]

\[ hQ_0 := c_1 h ; \]

\[ hQ_1 := c_2 h(x - 7y) + c_3 h y ; \]

\[ hQ_2 := c_4 h(x - 7y)(x - 8y) + c_5 h y(x - 7y) + c_6 h y^2 + c_7 h y z ; \]

\[ m_7 := d_1 b_5(x - 5y)(x - 6y) + d_2 b_5(x - 5y)(x - 6y) + d_3 b_6(x - 6y) + d_4 b_7 ; \]

\[ m_8 := d_5 b_5(x - 5y)(x - 6y)(x - 7y) + d_6 b_5(x - 5y)(x - 7y) + d_7 b_5(x - 7y) + d_10 b_7(x - 7y) ; \]

\[ m_9 := d_11 b_5(x - 5y)(x - 6y)(x - 7y)(x - 8y) + d_12 b_5(x - 5y)(x - 6y)(x - 7y) + d_13 b_5(x - 6y)(x - 7y) + d_14 b_5(x - 6y)(x - 7y) + d_15 b_5(x - 7y)(x - 8y) + d_16 b_6(x - 6y)(x - 8y) + d_17 b_6(x - 7y)(x - 8y) + d_18 b_6(x - 8y) ; \]

\[ p_7 := m_7 - hQ_0 ; \]

\[ p_8 := m_8 - hQ_1 ; \]

\[ p_9 := m_9 - hQ_2 ; \]

\[ \text{Coeffs}_7 := [\text{coeffs(collect(p7, [x, y, z], 'distributed'), [x, y, z])}] ; \]

\[ \text{Coeffs}_8 := [\text{coeffs(collect(p8, [x, y, z], 'distributed'), [x, y, z])}] ; \]

\[ \text{Coeffs}_9 := [\text{coeffs(collect(p9, [x, y, z], 'distributed'), [x, y, z])}] ; \]

\[ \text{solve(Coeffs7, [d_1, d_2, d_3, d_4])} ; \]

\[ \text{solve(Coeffs8, [d_5, d_6, d_7, d_8, d_9, d_10])} ; \]

\[ \text{solve(Coeffs9, [d_11, d_12, d_13, d_14, d_15, d_16, d_17, d_18, d_19, d_20])} ; \]

Thus, all arbitrary elements of \( hQ_0, hQ_1, hQ_2 \) are contained, respectively, in \( M'_7, M'_8, M'_9 \), as desired. \( \square \)
Proof of assertions: Macaulay2 routines. The following Macaulay2 code verifies Lemma 4.2(b) and (4.6); see lines o7–o10 and line o13, respectively.
